The second of the major physical regions of the country is Southern Tibet, consisting essentially of the deep valleys of the upper Brahmaputra (known as the Tsangpo in this area), Sutlej, and Indus rivers. These river valleys, which lie at a general elevation of approximately 12,000 ft., are the most heavily populated districts of Tibet. Southern Tibet is bordered on the south by the Himalaya Mountains. On the west Tibet is approached by the Karakoram Range, a vast dissected highland.

The third of the broad physical regions of the country is Eastern Tibet, which is an area between the Chang Tang and the Chinese provinces of Tsinghai and Sikang. This is a region of deep valleys separated by high ranges, and it is here that the great rivers, such as the Hwang Ho (Yellow River), Yangtze, Mekong, and Salween, originate and flow eastward and southeastward into China and the Peninsula of Further India.

**Mineral Resources.** Tibet is not an important source of mineral raw materials. Its resources are reputed to be rich, but they have never been carefully surveyed, and the output of those products is of minor importance. The more important minerals produced in Tibet are borax, gold, and salt, but only borax has been exported in significant amounts to the outside world, principally to India. Borax, soda, and salt are found mainly in the salt lake region of Chang Tang. Gold is reported to be widely distributed throughout Tibet, but only small amounts are mined.

**Climate.** The climate of Tibet is largely controlled by its deep interior position on the continent of Asia, by the encircling mountain ranges, which prevent the access of moisture-bearing winds, and by the generally high elevation, with correspondingly low temperatures. Although all parts of the region are more or less affected by these forces, the climate is far from uniform and varies from the mild and even subtropical conditions in Southern Tibet, to the cold steppe and desert climate of Chang Tang and the semipolar conditions of the northern and northwestern mountains. The region experiences extremely severe winters, in which the cold is intensified by strong, biting winds, and during this time most of the mountain passes are impassable. Winter temperatures are known to drop as low as −40° F. On the other hand, summers are relatively warm, especially in Southern Tibet, where average July temperatures of 68° F. or more have been recorded. Perhaps the most uniform climatic characteristic of Tibet is its generally scanty precipitation, which is estimated to average about 8 in. of snow and rain a year, but here again there are variations within the country. This precipitation, which comes mainly during the summer, generally declines from the south to the north with increasing distance from the sea, and the intervening mountain ranges capture most of the rainfall before it reaches the Chang Tang, Karakoram, and Kunlun.

**Flora.** The vegetation of the greater part of Tibet is extremely sparse and is characteristic of alpine and desert regions. The plains and mountains of northern and northwestern Tibet usually have a short grass cover, with some isolated bushes and stunted trees in the more sheltered and wetter areas. In southern and southeastern Tibet, on the other hand, especially in the region just north of the Himalayas, the plant cover is more profuse and subtropical in character because of the greater rainfall and greater warmth. Here woodland is more common, and the forests include such deciduous trees as birch, poplar, maple, walnut, and oak and several varieties of conifers.

**Fauna.** Many varieties of both wild and domesticated animals are found in Tibet. The wild breeds are most abundant in the mountains, but they are also common to the open steppes. They are usually well adapted to the extremely low winter temperatures of the region. Some of the common types of animals found in Tibet are the yak, antelope, wild sheep, wild goat, wild ass, marsh deer, bear, wolf, fox, and several varieties of ducks and pheasants. A. L. R.

## ETHNOLOGY

**Racial Origins.** The peoples of Tibet originated from all the surrounding areas, and they show a marked variation in physical type. The predominant Tibetan type is short and stocky and has strong Mongoloid features, with flat nose, thick lips, high cheekbones, light brown skin, coarse dark hair, and very little beard. The second type of Tibetan is more closely akin to the Karens of Burma and is tall, broadfaced, and large of frame.

**Language.** The Tibetan language, which is monosyllabic, belongs to the Sino-Tibetan group of languages.

*SPECTATORS VIEWING THE TENGECHOLING DANCE IN MOUNTAINOUS TIBET*

E. W. FLETCHER FROM BLACK STAR

**Religion.** The people of Tibet are followers of Lamaism, which is a modified form of Buddhism compounded with primitive magic and animism. More than one third of the population are monks, who, after a period of study and training, may qualify to become lamas (Superior Ones).

**Population.** The population of Tibet is estimated to be about 1,500,000. The capital city of Lhasa has an estimated population of 25,000. Long closed to foreign visitors, Lhasa has been known as the Forbidden City because of its religious secretiveness and animosity to outsiders. The second largest city, Shigatse, which has an estimated population of 9,000, lies on a western caravan route, and carries on an extensive trade. The third largest city, Gyangtse, has an estimated population of 5,000; it is a junction point for caravan routes and is noted for its manufacture of carpets.

## GOVERNMENT AND ECONOMIC CONDITIONS

**Government.** The Dalai Lama, the head of the Lamaist religion, formerly governed Tibet as an absolute ruler. In

the Sino-Tibetan treaty of May 1951 the Chinese Communists guaranteed that his "established status, functions, and powers" would not be altered. However, within three months after the treaty was signed, all local officials in Tibet had either been replaced or were working for the Chinese Communists. All Tibetan armed forces had been incorporated into the Chinese Communist Army. The Chinese Communists proceeded to build airfields in Tibet and established an extensive road-net and radio communication system to facilitate their control over the country.

**Trade.** Tibet's external trade is confined chiefly to China and India. The chief commodities exported to China are wool, rugs, musk, gold, salt, rhubarb, deerhorns, amber, borax, yak hides, foxskins, and sheepskins. In return China sends tea, cotton goods, rice, porcelain, cereals, and silk. The trade with India is, for the most part, an exchange of Tibetan wool and salt for the manufactured goods of Bombay and Calcutta. When the Chinese Communists took control of Tibet, they introduced their own currency and attempted to control all trade, particularly that in raw materials. This has caused alarm in India, which fears the diversion to China of wool formerly purchased from Tibet.

## HISTORY

Little is known of the history of Tibet prior to the seventh century of the Christian Era, although it is known that Buddhism was introduced during this time. The period between the seventh and fourteenth centuries was one of kingly rule, from which Buddhism and priestly power, after some recession, finally emerged with renewed strength and influence. The rule of the Dalai Lamas or "priest kings" began in the thirteenth century, and the system of priestly incarnation was begun in the latter part of the fifteenth century, under the rule of the Second Dalai Lama. This system is founded on the belief that the spirit of a departed lama is incarnated in some living person, who thereby becomes his successor.

The Tibetans regard the Fifth Dalai Lama, who reigned during the seventeenth century, as their greatest monarch. It was during his reign that the great Potala Palace, which still stands in Lhasa as the emblem of priestly sovereignty, was constructed. It was during this time also that the first European, purported to have been a Portuguese, visited Tibet. In the early years of the eighteenth century the Chinese established representatives in Lhasa who took an active part in the administration of Tibetan affairs. Later in that century Warren Hastings, an Englishman, established friendly contact with the Regent of Tibet, but it came to nothing, since the Tibetans believed that the British had aided and abetted an invasion of Tibet by Nepal in 1792.

One of the significant facts in the history of Tibet has been its exclusiveness and isolation, which reached their peak in the nineteenth century, when the country was completely closed to Europeans. Tibetan history in the early years of the twentieth century was characterized by a triangular struggle for power between the British, the Chinese, and the lamas. In 1904 a British Expedition led by Sir Francis E. Younghusband entered the Forbidden City and negotiated a convention which provided for trade and forbade Tibetans to grant concessions without British consent. In 1906 China confirmed this agreement, at the same time establishing safeguards against further aggression by the British.

An Anglo-Russian agreement of 1907 recognized China's suzerainty in Tibet, and in an attempt to strengthen its position in the country China then embarked upon a policy of force. This created resentment among the Tibetans, and in

COURTESY OF LOWELL THOMAS

*THE FOURTEENTH DALAI LAMA*

1912 they drove the Chinese from their country and in 1913 declared their independence. During the ensuing two decades British influence was greatly expanded in Tibet.

After 1932 the Chinese were again permitted to send representatives to Lhasa, and during the war years in China, from 1937 to 1945, the two countries were drawn into a new and closer unity. At the same time, Tibet began to relax its policy of isolation to some degree, and in 1947-1948 a Tibetan trade commission visited India, China, Great Britain, and the United States. By 1950, however, Tibet was under strong political and military pressure from Communist China and has since been occupied and virtually absorbed into that country. Considerable apprehension has been aroused in India by the presence of Chinese forces in Tibet. The Chinese Communists also apparently plan to infiltrate and subvert the small states lying between India and Tibet as well as the border areas in Indian territory inhabited by peoples never completely controlled by the Indian Government. Some special measures are being taken against these dangers, but the threat does not yet seem to have caused any deterioration of relations between India and Communist China.

**TIBETAN** [tɪbɛ′tən], an important member of the Tibeto-Burman group of the Sino-Tibetan languages. It is spoken chiefly in Tibet and in parts of the western Chinese provinces of Sikang, Tsinghai (Koko Nor), and Kansu and has about two million speakers. It has a large number of dialects, most of which have not yet been studied scientifically, but the generally recognized standard form of speech is the dialect of Lhasa.

The Tibetans derived their script, in the seventh century of the Christian Era, from the *devanagari* alphabet of the Hindus. There are now two varieties of this script in common use, the regular or printed type and the cursive type. It is generally believed that the earliest record consists of an

inscription of the ninth century, although some manuscript fragments have been claimed to be earlier. There is a large body of literature extant, which consists chiefly of translations of Buddhist sutras and their commentaries.

The modern colloquial Tibetan differs greatly from the written language, generally called classical Tibetan, in which the Buddhist literature is written. Classical Tibetan has a large number of consonantal prefixes which, though kept in some dialects, are dropped in the modern Lhasa speech; initial consonant clusters, like *pr-, br-, kr-, gr-, pl-, bl-,* and others, are simplified, and final consonants, like *-d* and *-s,* are dropped, though still kept in the script. Different tones are developed depending upon whether or not the syllable possesses a prefix and whether the syllable begins with a voiced or a voiceless consonant. The use of prefixes and of vocalic and consonantal changes, largely obliterated in the modern speech, is best illustrated in the formation of verbal aspects and derivatives in classical Tibetan. For example, in the word for "fill" *ḥgeṅs-pa* is the imperfect, *bkaṅ* the perfect, *dgaṅ* the future, and *k'oṅ* the imperative; *sgaṅ-ba* is "to grow or become full" and *skoṅ-ba* "to fulfill."

**TIBULLUS, ALBIUS** [tɪbʌ'ləs] (c.54-c.19 B.C.), Roman elegiac poet, was born about 54 B.C. near Pedum, in Latium, of a family of the lesser nobility. Our scanty knowledge of his life is derived from the first two books of elegies bearing his name, from casual mention by other ancient authors, and from an unreliable vita contained in the manuscripts of his work. His property was apparently confiscated in 41 B.C., but it was later restored to him, presumably because of his friendship with Marcus Valerius Messala Corvinus, a prominent statesman and soldier, but also a poet, orator, and patron of letters and the center of a literary circle. Tibullus was a friend of Horace and Ovid; he also seems to have accompanied Messala on a campaign in Gaul, and would have journeyed with him to the east, except that he was detained by illness at Corcyra.

Tibullus' journeys with Messala involved separation from Delia, the consuming passion of his life and the subject of the ten elegies of his first book. Of Delia, whose real name appears to have been Plania, Tibullus gives us no chronological or consistent account. At times she appears as single, but again, as when Tibullus' intimacy with her seems to have been aided by her husband's absence in Cilicia, she is presented as married. Tibullus alludes also to rivals for Delia's affections, but his patience sufficed to keep him from taunts and reproaches. The six elegies of Book II are addressed to Nemesis, apparently a high-class courtesan, and it appears that despite vexation at his own bondage and consciousness of his mistress' greed and selfishness, Tibullus loved her till his death. To manuscripts of Tibullus is appended a third book of six inferior elegies addressed to Neaera by a certain Lygdamus, seemingly also a member of Messala's circle. A fourth book, of yet different authorship, which in some manuscripts is treated as a continuation of Book III, contains a tasteless panegyric of Messala in 211 hexameters, and also five elegies in which Sulpicia, Messala's niece, unblushingly yet charmingly confesses her love for the youth Cerinthus.

Tibullus' imagination is neither powerful nor wide-ranging, but although his thoughts as a lover are conventional they seem none the less sincere. His mood is pensive, and his verse is musical and charming. G. McL. H.

**TICINO** [titshi'no], a small Swiss canton, 1,086 sq. mi. in area. Ticino is the only Swiss-Italian canton. It joined the Swiss federation officially in 1803, after having been subject territory since the beginning of the sixteenth century. Bellinzona is the capital. The chief resort towns are Locarno and Lugano. The concentration of population is in the mountain valleys which lead from the Swiss-Italian lakes to the Lepontine Alps. Pop. 1953, 178,600. S. Van V.

**TICINO,** a river 155 mi. long which rises in Switzerland, in the Lepontine Alps southwest of St. Gotthard Pass, at 9,500 ft., and flows into northern Italy. The largest tributary of the Po, the Ticino in its upper course describes a large curve, following the Valle Leventina, where it is joined by the Brenno and Moësa rivers. This section of the Ticino's valley is followed by the St. Gotthard railway and has always represented a most important communicating link between the Po Valley and the countries of Central Europe. The Ticino then enters Lake Maggiore at its northern end near Locarno and comes out of it at its southern end at Sesto Calende. From this point on, the Ticino marks the historical border between Piedmont and Lombardy, continuing its course to the southeast. A large amount of its water is diverted for irrigation purposes. The Ticino empties into the Po River, 3.5 mi. downstream from Pavia. L. J. W.

**TICKBIRD,** a name applied to any one of several birds, such as the oxpecker, which alight on the backs of cattle to feed upon the vermin with which the animals are infested. However, the tickbird is better restricted to three species of tropical New World cuckoos united in the genus *Crotophaga.* They are characterized by high, compressed, arched bills, and their feathers are black, with bluish reflections. All are gregarious, even in breeding season, when each flock builds a communal nest in which the females lay their eggs and share the duties of incubation. Tickbirds are known also as anis.

H. G. De.

**TICKELL, THOMAS** [tɪ'kəl] (1686-1740), English poet, was born Dec. 17, 1686, at Bridekirk, Cumberland. He attended Queen's College, Oxford, taking a bachelor's degree in 1705 and a master's in 1709. Through his interest in poetry he was introduced to the Whig sphere of Joseph Addison, whom he served as under-secretary in an Irish post from 1714 to 1717 and in the British cabinet from 1717 to 1719. Addison's praise of Tickell's translation of the first book of the *Iliad,* published two days after Alexander Pope's, was an element in the subsequent alienation of Pope and Addison. In 1721 Tickell edited Addison's works, adding an elegy which Dr. Johnson praised highly. He died at Bath, Apr. 21, 1740. H. Pe.

**TICKING.** *See* Textile Fabrics (*Cotton Fabrics*).

**TICKNOR, GEORGE** [tɪ'knər; tɪ'knɔr] (1791-1871), American scholar and educator, was born Aug. 1, 1791, in Boston. After extensive travel and study abroad, he became in 1819 professor of modern languages at Harvard, where he introduced German pedagogical methods. He resigned in 1835 to devote himself to the writing of his *History of Spanish Literature* (1849), the fruit of assiduous research and study, and one of the most widely esteemed literary histories ever published in America. In this work Ticknor

investigated the origins of Spanish literature, traced its progress to the early years of the nineteenth century, and devoted an appendix to a discussion of the origin of the Spanish language. His literary output included further a number of biographical works, the most important of which is the *Life of William Hickling Prescott* (1864). Ticknor was also instrumental in founding the Boston Public Library in 1852. He died in Boston, Jan. 26, 1871. N. F. A.

**TICKS,** large mites which are parasitic on mammals, birds, and reptiles. They are the largest members of the order Acarina, and the ones which most frequently come to the attention of man; certain females when full of eggs and blood may reach 1 in. in length. They suck the blood of their hosts. The females usually remain attached until they are ready to lay their eggs, at which time they drop to the ground. The males are much smaller and commonly wait on the tops of low plants for some animal to come along, to which they readily transfer. Aside from the annoyance of their bites, ticks may also cause serious diseases as the result of carrying parasitic organisms in their bodies. Rocky Mountain spotted fever in man and Texas fever in cattle are among the better known and more serious of these diseases. *See also* Arachnida; Mites. W. I.

*FORT TICONDEROGA, ORIGINALLY CALLED FORT CARILLON, WAS BUILT AT THE HEAD OF LAKE CHAMPLAIN IN 1755 BY THE FRENCH.*

NYSPIX—COMMERCE

**TICONDEROGA** [tai′kɒndəro′gə], a village and fort in Essex Co., N. Y., about 85 mi. north of Albany, on the La Chute River on a neck of land between Lake George and Lake Champlain. The name is derived from the Iroquois Indian word meaning "between two waters." In 1755 the French built a military road along the Indian portage between the two lakes and constructed Fort Carillon, later named Fort Ticonderoga, some miles away on a bluff overlooking the village. From here Montcalm set out in 1757 to capture Fort William Henry at the head of Lake George. On July 4-8, 1758, an attempt to capture the fort by General James Abercrombie, with a force of 16,000 men, was beaten off by a garrison of less than 4,000 French; the first shots fired in this long and hard battle caused the death of Lord Howe. In 1759 the fort was captured by General Jeffrey Amherst, and it then became Fort Ticonderoga. At the beginning of the Revolutionary War the fort was captured by surprise on May 10, 1775, by Ethan Allen and his Green Mountain Boys. In 1777 the American garrison was forced to evacuate the fort by the superior forces of General Burgoyne's expedition. Prior to its surrender later in that year by the Convention of Saratoga, by which Burgoyne surrendered his troops to General Gates, Colonel John Brown made a daring but unsuccessful attempt to wrest the fort from the British. In 1780 the British retook the fort without a fight but abandoned it within a few months. The site of the fort was purchased by William Ferris Pell in 1820. In 1909 the crumbling fortifications were restored and a historical museum, visited yearly by thousands of tourists, was built near by.

The town is an important paper and lead-pencil manufacturing center. A 30-ft. waterfall in the river at the outlet of Lake George provides power for the pulp and paper mill and for the pencil factory. The pencil industry grew up around a graphite mine discovered in 1815; however, it is now cheaper to import the graphite than to work the local mines. The village was incorporated in 1889. Transportation is provided by the Delaware and Hudson Railroad. Pop. 1950, 3,517. C. W. D.

**TIDES,** the periodic rise and fall in the waters of the earth, produced by the gravitational attraction of moon and sun acting upon a rotating earth. All large bodies of water, including oceans, seas, and lakes, exhibit tides to greater or lesser degree, although in lakes the effect is small.

The greatest elevation of the waters on a given day or half-day is known as high tide, and the greatest depression

is termed low tide. The exact moment at which the absolute tidal peak or depression is reached, and at which no change in vertical height is observed, is the "stand" of the tide. Mean sea level is the resulting data when the sea level is measured with respect to an arbitrary mark (above which high tide rises and below which low tide falls), and when the average of a large number of such measurements spaced at equal intervals of time is taken. Mean tide level is the computed mean of an extensive series of measurements of the height of tide at high water and at low water. Both of these mean levels are referred to a local datum mark. Mean sea level and mean tide level are not synonymous, for usually the tide does not rise at the same rate it falls. The range refers to the difference, in feet and tenths of a foot, between high-water and low-water levels encountered at any one location.

The vertical rise and fall of tides is accompanied by a horizontal movement of approach and recession of the waters with respect to the seashore. By the adjustment in vertical height of the tides, as well as other causes (wind, outflow of streams, etc.), large-scale horizontal movements are induced in both coastal and offshore waters. These horizontal movements are clearly distinguished from tides by their designation as tidal currents. Tidal currents should not be confused with ocean currents, which are of other than tidal origin. All tidal phenomena are characterized by periodicity. Tidal currents are recurrent in time, and alternate in direction of flow, whereas ocean currents, continuous and progressive in movement, are caused by the general wind circulation of the atmosphere, and occupy a considerably larger portion of the open sea.

The period during which the prevailing horizontal movement of the tidal current is from sea toward land is described as flood; the opposite cycle, during which the current is running from land toward sea, is known as ebb. It is important to note that flood and ebb do not necessarily correspond with high tide and low tide, respectively. The exact time of change from ebb to flood, or reverse, when no tidal current is observed, is termed slack water. Slack water, likewise, need not be coincident in time with tidal stand. The set of the tidal current defines the direction of current movement; and drift indicates the velocity of the current.

Tides repeat themselves in an alternating cycle of "highs" and "lows" in accord with changing astronomical, hydrological, and meteorological circumstances. The periodic phase of high and low tides is caused by two tidal bulges and two tidal depressions, with modifications thereof.

**Explanation of the Tide-raising Force.** Although the sun plays a measurable role in tidal phenomena, the predominant factor responsible for the tides is the force of the moon's gravitational attraction. Each particle of water, wherever situated on the earth's surface, is influenced by tidal action to an extent determined by Newton's Law of Gravitation. This law states that every particle of matter in the universe attracts every other particle with a force that varies directly as the product of the two masses concerned, and inversely as the square of the distance between them. The law implies that the more massive two bodies are—that is, the greater the amount of substance each contains—the greater the force of attraction exerted between them will be. (For the same distribution of density, a small body exerts less gravitational attraction than a large one.) The law also asserts that the farther two bodies are apart, the less the gravitational force exerted between them. The effect of distance between the two bodies plays a much more important role in determining the magnitude of the tide-raising force than does the ratio of their masses.

The gravitational pull of the earth on the moon (tending to keep the latter in its orbit around the earth) is opposed by the pull of the moon on the earth—a force smaller in amount in proportion to the moon's smaller mass, but nevertheless tending to pull the earth toward the moon, and also tending to "lift" any objects on the earth's surface toward the moon.

A point on the earth's surface directly beneath the moon is only 4,000 mi. from the earth's center and, on the average, 234,850 mi. from the moon's center. Thus, at this point on the earth's surface, the pull of the earth on any object is nearly 9 million times stronger than the pull of the moon on the object. It must be emphasized, therefore, that the moon's direct pull is insufficient to lift the enormous weight of the waters of the earth by any amount whatsoever, and that, contrary to popular belief, the vertical component of the moon's gravitational attraction plays no part in the production of the tides. In short, the tides, despite a common misbelief frequently asserted, are not caused by a vertical uplift of the waters of the earth due to the lifting effect of the moon. Furthermore, the highest tides are not usually produced with the moon directly on the meridian of a given place.

The oceans, seas, and large lakes of the earth's surface (as fluid bodies) are, however, free to move under the action of a sideward displacing force, and any slight tendency toward horizontal movement will cause them to flow. All waters not directly underneath the moon are acted upon by a horizontal component of the moon's gravitational attraction as well as a vertical component, and undergo a horizontal movement relative to the earth's solid crust. The result is a flow of water from adjacent regions on the earth's surface toward a position underneath the moon. The resultant amassing of waters at a point beneath the moon produces a high tide at this position. The actual tidal bulge in the open ocean is only one or two feet in height, but this is augmented greatly when the tidal bulge is thrust up against continents, islands, etc. By the removal of water from adjacent regions toward the sublunar point, a corresponding low tide is produced at two other points, each a quarter of the way around the circumference of the earth. Paradoxically, the lowering of the ocean water at these two low-tide positions is accompanied by an accumulation of water not only on the side of the earth directly under the moon, but also on the side exactly opposite the moon. The explanation lies again in Newton's Law. Two objects at different distances from the same attracting force, and hence subject to different degrees of acceleration, undergo a relative displacement with respect to each other, as the closer object is urged more toward the center of attraction. The tidal bulge on the side of the earth directly beneath the moon is known as the direct tide; that in the antipodal position, the opposite tide. The direct tide is barely 5 per cent greater than the opposite tide.

Due to the movement of the moon in its orbit about the earth, two successive high tides or two successive low tides at a given location occur approximately 12 hr., 25 min. apart; the time between a high tide and the next succeeding low tide is about 6 hr., 12 min. The period of 24 hr., 50 min. between successive high tides is known as the tidal day.

**Tidal Inequalities.** The action of the tide is very complex, involving many factors which must be considered to describe exactly the tide at any place. At any station, the principal features are specified by (a) the time-relation of the tide to the moon's transit, (b) the range of tide, and

(c) the type of tide or form of tide-curve. The numerous variations in direction and intensity of the tide-raising forces cause differences in morning and afternoon tides at a certain port, and also differences between the same tides at separate ports. These differences are called tidal inequalities.

*Semi-diurnal Effect.* This is the principal tide-raising force, usually giving two complete cycles in a day, the cause of the period being the rotation of the earth. The moon revolves around the earth in the same direction as the earth rotates on its axis, counterclockwise looking down from the north ecliptic pole. It therefore requires a little extra time for a given point on the earth's surface to "catch up" to a position directly underneath the moon at each successive rotation. For this reason, both high tides and low tides occur, on the average, approximately 50 min. later each day. This quantity is termed the lunar retardation.

*Semi-monthly Inequality.* This is the principal variation and has a period of about 13 5/6 days, the cause being the moon's revolution around the earth, and the phase or alignment of the sun, moon, and earth. When the sun and moon are in line, either on the same side or on opposite sides of the earth—at new or full moon—and their gravitational forces pull together along a common axis, the high tides due to the sun are superimposed upon the high tides due to the moon; similarly the alignment of the sun's gravitational force detracts from the low tides due to the moon. The result is that the high tides are higher, and the low tides lower, than those produced by the moon alone. Tides showing such effects of reinforcement of gravitational action are called spring tides.

When the gravitational forces of sun and moon act along lines at right angles to each other—as at first-quarter and last-quarter moon—the tide-raising effects of sun and moon tend to cancel each other, since the high tide produced by the sun is superimposed upon the low tide caused by the moon. Under such conditions, the high tides are not as high, nor the low tides as low as produced by the moon alone, and these intermediate tides are known as neap tides. The range between high and low, in this case, is reduced by a factor of more than one half, as compared with spring tides. In the Atlantic Ocean, both spring and neap high tides usually follow the appropriate phase of the moon by a full day; in the Pacific, the delay is only five hours. At New York and San Francisco harbors, and in the Gulf of Mexico, spring tides are 40 per cent greater than neap tides. This effect is additive to other possible effects.

*Lunar Parallactic Inequality.* The period of this effect is 27⅓ days and the cause is the changing distance of the moon from the earth during its revolution. Because of the ellipticity of the moon's orbit, the tide-raising influence of the moon at perigee may be as much as 40 per cent greater than at apogee. This is for New York Harbor, where the effect of apogean or perigean tides is usually discernible about 1½ days after the appropriate lunar phase is reached. For San Francisco Harbor, the difference produced by perigean and apogean tides is only 32 per cent and follows the appropriate lunar phase by two days.

*Diurnal Inequalities.* The period of this effect is 24 hr. 50 min. The cause is the rotation of the earth and the varying declination of the moon. When the moon is near the celestial equator, the two high tides on a certain day (and also the two low tides) are not very different, and the morning and afternoon highs (or lows) are quite similar. But as the moon increases its northern or southern declination, the morning and afternoon tides of the same kind begin to differ, and when the moon is at maximum northern or southern declination the differences are extreme, resulting in tropic tides. These tides are so called because the moon is nearly above the earth's tropics of Cancer and Capricorn.

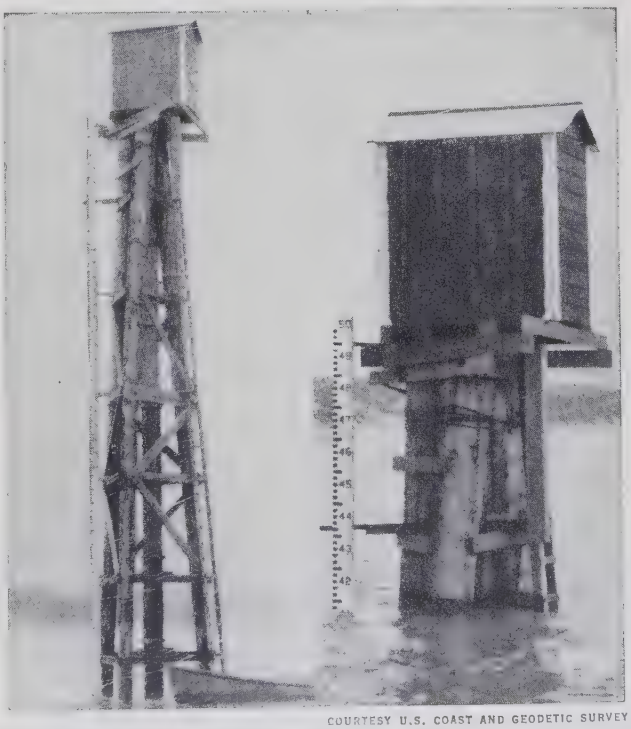
Diurnal inequality does not materially affect the heights of two successive low tides in the Atlantic and, even in high tides, the effect is small compared with the total range. However, in the Pacific, the diurnal inequality in the low tides is three times that occurring in the high tides.

*Semi-annual Inequality.* The period of this effect is one-half year, and the cause is the earth's revolution around sun and the sun's varying declination. Twice a year—for several days around equinox times—the sun is close to the celestial equator, its declination being nearly 0°; and for a day or so during every half-month, the moon is likewise nearly on the celestial equator. When the sun is at the equinoxes, therefore, there is an interval when the declinations of the moon and the sun are both nearly 0°. The combined gravitational effect of the two tide-raising bodies at such times most noticeably affects a station near the earth's equator. If at the same time the moon is at new or full phase, so-called equinoctial spring tides occur.

*Solar Parallactic Inequality.* The period of this effect is one year and the cause is the variation in distance of the earth from the sun during the earth's revolution. Once each revolution, the moon comes to its closest approach to the earth (perigee). Once each year, about January 2, the earth in its orbit also reaches its position of closest approach to the sun (perihelion). When these two times of closest approach coincide, giving the greatest combined attracting force, greater high tides and more exaggerated low tides may be expected. Similarly, if aphelion coincides with apogee, reduced high tides and less severe low tides are the result.

**Instruments and Tide Predictions.** Measurements of changing level of the tides are secured by means of tidal gauges, which may be of several kinds.

*Staff Gauge.* The staff gauge is a simple scale graduated to read in feet and tenths of feet, attached vertically to a pier

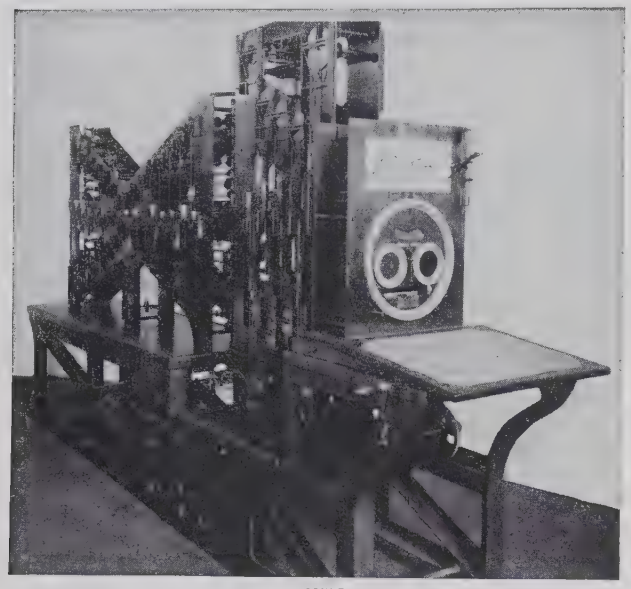


COURTESY U.S. COAST AND GEODETIC SURVEY

*Tide gauge, Anchorage, Alaska;* (left) *low tide;* (right) *high tide*

or fixed support in the water so that the zero-index lies below the lowest level of the tides. The changing height of the water surface is read directly from this fixed scale.

*Box Gauge.* The box gauge is used where continuous waves, ground swells, or choppy seas make readings of the staff gauge difficult. In this type of instrument, a floating gauge is enclosed within a protecting float-well, consisting of a hollow box or pipe anchored to the ocean floor, and to which the changing tides have access only through a tiny opening deep below the surface of the water. Readings of the tide-level are made from the index portion of the floating staff, rod, or tape, which protrudes from the float-well.



COURTESY OF U.S. COAST AND GEODETIC SURVEY

*TIDE-PREDICTING MACHINE*

*When set to certain predetermined constants, this machine automatically gives the times and heights of the tide of any port in the world and for any year.*

*Pressure Gauge.* In the pressure gauge, variations in the height of the tide above a group of rubber sacs located at a fixed depth in the water are indicated by a changing hydrostatic pressure as the water-level changes. The pressure readings are communicated from the sacs below the water to a pressure gauge at the surface. Automatic registering devices may also be used to provide a continuous record of tidal changes at any one station.

*Tide Tables.* The United States Coast and Geodetic Survey has 61 stations in operation within the continental limits of the United States and 23 stations in territorial waters for observation of the tides. Their annual *Tide Tables* contain tide predictions for 172 principal world ports and 4,900 supplementary ports; current tables of lesser scope and magnitude are also published.

In the prediction of the data for the tide tables, two principal methods are used, the non-harmonic and harmonic methods. The non-harmonic method is based entirely upon observations. In addition, this procedure makes use of the "establishment of the port" and certain basic astronomical data pertaining to the hour-angle of the moon, the time of its meridian passage, its phase, declination, and parallax. After the corrections have been applied for these various factors, the calculation of the time and height of the tide for any port is a mathematical procedure.

The harmonic method is partially analytical and partially by observation of the tides extending over at least one lunar month. Long observations are needed at each port for confirmation of such predictions because of the physical properties of inertia and friction, and the many complexities in the configuration of land masses and water basins. Since tides are periodic, the procedures of harmonic analysis may be applied in this method. The observed tide is assumed to be composed of a series of simple constituent tides, each produced by a different tide-raising force or component. Of these, thirty-seven are employed to complete the solutions, although in some cases the additional components beyond twenty are almost negligible. The simultaneous introduction of thirty-seven constants into a mathematical equation, and the solution thereof, is facilitated by enormous tide-predicting machines. Such complex machines are in the possession of the U. S. Coast and Geodetic Survey and foreign agencies.

**River Tides and Currents.** The mutual interaction of tides and river currents is apparent wherever large streams discharge into coastal waters. The height of the tides in bays, rivers, and estuaries may be considerably increased by a strong outflow of marginal streams, swollen by hydrological run-off and by freshets due to melting snow. Conversely, the effects of ocean tides may extend as tidal currents far up a river. For example, in the Hudson River the effect of the tides is encountered at a distance of 131 mi. upstream from the river mouth. Tidal currents usually continue to move upstream until they encounter falls or rapids too strong to surmount. River currents produced at high water travel faster than those at low water, the maximum velocity of tidal currents being as much as 12 knots.

*Tidal Bore.* When water is constrained to move in a narrow channel under the action of a large vertical tide, a sizeable head of water results and moves upstream as a solid wall. This phenomenon is the tidal bore. Such bores occur mainly far upstream where both friction and downstream river current combine to present the greatest resistance to the approaching tides. A famous tidal bore occurs in the Bay of Fundy, situated between New Brunswick and Nova Scotia, Canada. At Moncton, New Brunswick, the Petitcodiac River empties into the Bay of Fundy as a marginal stream. At low water, it disgorges over mudflats and sandbars as a stream 500 ft. wide. With the approach of high tide, a solid wall of water more than 2,500 ft. wide advances up the river, as a hissing, turbulent eddy two or three feet high. The largest known tidal bore occurs on the Tsientang River, which flows into the China Sea; here the tidal bore rises to 10 ft. in height.

*Reversible Waterfall.* The reversible waterfall is another phenomenon associated with river tides. A typical example exists on the St. John's River, New Brunswick, Canada. Here, a narrow defile presents a constricted opening to the passage of tidal waters upstream into a basin located above the elevation of low tide, but somewhat lower than the elevation of high tide as produced in the narrow gorge. The conducting channel thus acts as a ridge over which the water falls. At low tide, the water flows normally from the upper basin, through the narrow passage and over the ledge to create a downstream waterfall. At high tide, however, the precipitous rush of water into the narrow gorge builds up a large head of water, from which the water flows into the upper basin to create an upstream waterfall. The flow continues until the two water levels are equalized, and the tide begins to fall, then reverses in direction and produces a downstream falls again. The average fall of water produced within the gorge is about 9 ft., but with the largest tides the outward fall may be over 16 ft. high, and the inward fall over 12 ft.

**Greatest Tidal Ranges.** The highest tide in the world is that achieved under strong current conditions at Minas Bay, an inlet of the Bay of Fundy, in Canada. The tide curve exhibits the normal, semi-daily type. Often the tide rises to a height of over 40 ft. in six hours, falling as much in the succeeding six hours. In the case of spring tides, with perigee and maximum declination of moon combining their effects around a certain day, the range of tide is likely to be 50 ft. This exceptional tidal rise and fall is caused partly by the funnelling effect of the Bay of Fundy, whereby the depth of water decreases and the shorelines converge as one travels upstream. This is the least of three reasons for the large range, the others involving a technical discussion of the theory of tides, waves, and oscillations.

The following list indicates the height of tides at a few selected ports around the world. This list is from recent tide tables (which vary somewhat from year to year).

List of Selected Ports with Their Tidal Ranges and High-water Intervals

| *Port* | *High-water interval* | *Mean range* | *Spring range* |
|---|---|---|---|
| | h m | ft. | ft. |
| Cape Morris Jesup, n. Greenland | 10 49 | 0.4 | 0.6 |

(di. ra. = diurnal range)

**Wind and Weather.** Winds may have considerable effect in modifying the normal rise and fall of tide. A wind coming from the ocean toward the shore has the effect of raising the water level, by initiating a current that carries the water landward. High tides are thus increased over the average, while the low tides are also higher than average. A wind blowing from the land toward the ocean has the effect of lowering the water level by carrying the water away from the coast.

The effect of increasing barometric pressure over an extended surface of water is to diminish the level of the water due to the additional superincumbent weight of the atmosphere. As the barometric pressure rises one inch, the level of the water is depressed about 13 inches. A fall in the barometric pressure produces a corresponding rise in the level of the water. The combination of an extreme drop in atmospheric pressure together with winds of hurricane force can, therefore, produce appreciable heads of water. The so-called tidal wave is in no way the outcome of tidal forces, and lacks the required periodicity of tidal phenomena. This occurrence is in general caused either by violent storms of hurricane intensity or by deep-seated earthquake disturbances generated in the ocean floor, in which case they are called *seismic sea waves.*

**Harnessing the Tides.** This matter has long been the subject of debate in terms of practicability for power production when existing stores of coal, gasoline, and other hydrocarbon fuels are exhausted. Although four methods for utilization of tidal energy have been visualized, the most practical is the tidal basin system. In this system, the rise and fall of the tides is exploited by a suitable system of gates and sluices, so that a constant head of water is maintained from which to generate power. The amount of energy capable of production by this means is a direct function of the area of the capture-basin and the potential head of water. This latter factor is, in turn, a function of the range of the tides. The available head of water is by far the most important question in power production, although the size of the capture-basin is also an important factor in constructional costs.

Serious consideration has already been given to the possibility of construction of such tidal power plants on the Severn River in England, where a tidal range of more than 20 ft. is theoretically capable of producing 28,800 hp. of energy for each square mile of water impounded. A theoretical power output of 500,000 hp. could also be achieved in the tidal conditions at Passamaquoddy, Maine. However, the financial costs of constructing basins of adequate size for effective production of power to replace or supplement existing sources is a major drawback. Factors involved in the variation in the height of the tides, in the times of succeeding high tides, in the available head of water, and in the potential power output available contribute to the problems that interfere with utilization of tidal energy for practical purposes. F. J. Wo.

**TIDYTIPS,** a handsome member, *Layia platyglossa,* of the family Compositae. This annual grows about 1 ft. high and bears showy flower heads having numerous rays, bright yellow with white tips. This annual is found growing in the foothills and valleys of southern California, and two members of the family, both natives of the Pacific states, are cultivated as ornamental plants. They are the yellow tidytips, *L. elegans,* and the white tidytips, *L. glandulosa;* the former is characterized by yellow or white-tipped rays, while the latter has white or rose-tinted rays. M. G. W.

**TIECK, JOHANN LUDWIG** [ti'k] (1773-1853), German poet, storyteller, and critic, was born in Berlin, May 31, 1773, the son of a ropemaker. Tieck studied at the Universities of Halle, Göttingen and Erlangen, concentrating on English literature, especially of the Elizabethan period. He remained a student and admirer of Shakespeare and his times throughout his life, but his comprehensive work on the subject, full of bold, untenable conjectures, was never completed. In 1794 he entered the service of the Berlin publisher and rationalist writer C. F. Nicolai, whose narrative series, *Straussfedern,* he continued with tales chiefly of a satiric, didactic-rationalistic bent, in striking contrast to his earlier exotic, highly imaginative works, among which was *Almansur,* 1790. This blending of rationalism and Romanticism persisted throughout his life.

*LUDWIG TIECK*

FROM A PAINTING BY JOSEPH STIELER

COURTESY OF THE NEW YORK PUBLIC LIBRARY

Tieck's principal writings are the melancholy, epistolary novel *William Lovell* (1795-1796) and the *Volksmärchen* (1797). The latter contained stories retold from chapbooks of the fifteenth and sixteenth centuries, partly in narrative form, for example *Die schöne Magelone,* and partly in dramatic form, for example *Ritter Blaubart* ("Knight Bluebeard") and *Der gestiefelte Kater* ("Puss in Boots"); it also contained original tales of a highly imaginative, weird nature, notably *Der blonde Eckbert,* translated into English by Carlyle. He attempted to counteract the prevailing Rationalism, of which Nicolai was an extreme representative. The *Volksmärchen* attracted the attention of the Schlegels, especially August Wilhelm, who proclaimed Tieck a "Romantic" poet. In 1799, Tieck found a friend in the Romantic author Friedrich von Hardenberg, who was called Novalis, and began his *Romantische dichtungen* (1799-1800), in which the typically Romantic panorama in dramatic form, *Leben und Tod der heiligen Genoveva,* appeared. In 1804 was published the amorphous drama *Kaiser Octavianus,* considered by Tieck the best example of his "Romantic manner."

In 1802 Tieck and his family became guests of Count von Finchenstein on his estates in the Neumark near Frankfurt am Oder. There he remained until 1819, though with interruptions that included a visit to England in 1817, preparing modernized versions of German medieval poems (*Minnelieder aus dem schwäbischen Zeitalter,* 1803), collections of Elizabethan plays (*Altenglisches Theater,* 1811), and an edition of German dramas of the sixteenth and seventeenth centuries (*Deutsches Theater,* 1817). He also began a collection of some of his earlier Romantic works, which were published as *Phantasus* (1812-1816), linking them with clever conversations recalling Boccaccio's *Decameron,* and adding some new works, among them *Fortunat,* in the same manner.

In 1819 Tieck settled with his family in Dresden, where from 1825 to 1830 he served as dramatic adviser to the royal theatre. Here he turned away from Romanticism and wrote a long series of *Novellen,* in which the usually realistic plot is subordinated to an often didactic discussion of social and literary questions. *Die Gemälde* (1821) and *Der Lebens Überfluss* (1837) are characteristic *novellen;* others, dealing with historical material, include *Dichterleben* (1826), a story of Shakespeare's youth, and *Der Aufruhr in den Cevennen* (1826). Tieck's last important work, *Vittoria Accorombona* (1840), is a novel of the Italian Renaissance. He also wrote many fugitive articles during this time and edited the continuation, made by Count W. H. von Baudissin and his own daughter Dorothea, of the A. W. Schlegel translations of Shakespeare. In 1842 he was summoned to Berlin by the Prussian king, Frederick William IV, and supervised performances of ancient Greek and Elizabethan dramas. From 1820 to 1840 his works had considerable influence upon English and American literature. Tieck died in Berlin, Apr. 28, 1853. E. H. Z.

**TIEN, THOMAS** [tɪɛ'n] (1890- ), cardinal priest, Archbishop of Peiping, was born Sept. 27, 1890, at Changtsiu, China. After ecclesiastical studies in the Seminary of the Divine Word at Yen-chew-fu, he was ordained priest in 1918, and in 1931 made his profession in the Society of the Divine Word, a missionary religious congregation. Having filled important administrative posts from 1932 onward, he was consecrated titular bishop of Ruspe in 1939, and in 1942 was named vicar apostolic of Tsingtao. He was among the thirty-two cardinals created in the consistory of Feb. 18, 1946. By a decree of Apr. 11, 1946, the Holy See raised the church in China from missionary to hierarchical status, establishing twenty ecclesiastical provinces, each headed by a metropolitan archbishop, and seventy-nine suffragan sees to be governed by as many bishops ordinary, and retaining thirty-eight prefectures apostolic. On May 10, 1946, Cardinal Tien was named first archbishop of Peiping and became the highest ranking prelate in China. W. C.

**TIEN SHAN** [tɪɛ'n shɑ'n], a mountain range in Sinkiang, China, and the southern Soviet Union. The longest range in Asia north of the Himalayas, it extends for 1,500 mi. northeastward from the Pamir Knot to separate the Dzungarian region from the Tarim basin. The range averages 250 mi. in width and covers an area of 400,000 sq. mi. The relief is broken and jagged, reaching 23,620 ft. in the Tengri Khan in the center and 17,946 ft. in the Bogdo Ula in the east. Glaciers are found in several parts of the range, particularly in the west; but the rivers, though rushing in places, assume no great size. The slopes are forested when exposed to moisture-bearing winds, but are covered with grass in the rain shadows. The climate is dry and clear for the most part. The range was uplifted in some former time, then worn down to a flat surface, or peneplain, and then uplifted again to about 20,000 ft. elevation. The present mountains are second-cycle mountains into which the present-day rivers are eroding valleys. There is considerable earthquake activity at the borders of the range. Oil has been found at Wusu in Sinkiang. There is considerable settlement in the lower valleys of the range where irrigation is possible. During the summer, transhumance is practiced on the grassy higher slopes. There is little industry in the Tien Shan beyond the small native crafts. J. E. V.

**TIENTSIN** [tɪɛ′njɪ′n; tɪ′ntsɪ′n], a city in Hopeh Province, in northeastern China, one of the largest and most important cities in China. Tientsin is located at the confluence of the Pei Ho and the Grand Canal, which drain the vast and fertile Hopeh alluvial plain. From Tientsin the confluence, known as the Hai Ho, flows eastward and enters the Gulf of Chihli (Pohai) at Taku, about 35 mi. from Tientsin. Tientsin is at the junction of the Tientsin-Pukou and the Peiping-Mukden railways, and is about 86 mi. southeast of Peiping.

Since early times, Tientsin has been a center of economic activity in northern China, and in 1860 Great Britain, recognizing the fact, obtained economic concessions in the city. The British were followed by France, Belgium, Japan, Italy, Germany, Russia, and Austria-Hungary, all of which obtained concessions. During the Boxer Rebellion in 1900 the Boxers laid siege to the foreign concessions for twenty-seven days until combined military forces of the United States, Great Britain, France, Germany, Russia, and Japan relieved the beleaguered concessions and forced a lifting of the siege. The Russian concession was surrendered by the Bolsheviks during the Russian Revolution, and the German and Austro-Hungarian concessions were taken over by the Chinese at the end of World War I. All other concessions, excepting the Japanese, were relinquished in the years after 1932; the Japanese were in Tientsin until 1945. In November 1931, shortly after the Mukden Incident, the Japanese instigated an uprising in Tientsin and in the ensuing confusion smuggled their puppet, Henry Pu-yi, who had been living under Japanese protection in Tientsin, into Manchuria where he was made executive head and, later, emperor of the Japanese-dominated state of Manchukuo. Fighting between China and Japan broke out in 1933 in Hopeh and Chahar provinces but was soon terminated by an armistice. Four years later Japan began a wholesale attack on China and captured Tientsin on July 31, 1937. The city was occupied by the Japanese until late in 1945. During the Chinese Civil War Tientsin was captured by the Chinese Communists in January 1949.

The city has well-paved roads, many modern buildings, and more than 700 factories, including carpet and rug factories, cement works, flour mills, and iron works. It handles at least ten per cent of China's trade: exports include hog bristles (largest single item), furs, egg products, raw cotton, cow hides, straw braid, and wool; imports include cotton and woolen piece goods, machinery, railway material, manufactured metals and minerals, and electrical appliances. Tientsin's port is the harbor of Tangku in the city of Taku at the mouth of the Hai Ho. Because of the volume of foreign trade, the condition of the harbor is of paramount importance to Tientsin, as the silt-filled Hai Ho presents a continuing challenge to river navigation. Most seagoing vessels are obliged to dock at Tangku; shallow-draught lighters are employed to carry goods up and down the Hai Ho between Tientsin and the port. The Japanese constructed the Tangku harbor in 1940, and the Chinese later developed it further. Three breakwaters protect the harbor; the wharf frontage of almost 2 mi. includes berths for vessels up to 350 ft. in length, with draughts up to 14 ft. In the winter icebreakers are used to keep the river and port free of ice.

Temperatures at Tientsin range from a maximum of 107° F. to a minimum of −3° F. with the annual mean temperature about 52° F. Annual precipitation averages about 20 in.

The city wall around Tientsin, erected in the early fifteenth century, was torn down in 1901 at the direction of the international commission that governed the city for several years after the Boxer Rebellion. Many temples stand in the city, including one to Li Hung-chang, nineteenth-century Chinese statesman, governor, and military leader. Tientsin is an educational center and its many institutions of learning include Nankai University, a teacher's college for women, and an engineering school. Pop. 1947, 1,686,543.

A. C. T.

**TIEPOLO, GIOVANNI BATTISTA** [tyɛ′polo], called "Giambattista," (1696-1770), Venetian painter and etcher, was born in Venice in March 1696, the son of a well-to-do merchant mariner. He received his earliest instruction from Gregorio Lazzarini, a minor painter then of some repute, and through Sebastiano Ricci came to understand the Venetian decorative tradition. His first work was influenced by his slightly older contemporary, G. B. Piazzetta, whose solid construction and sharp oppositions of light and dark were derived from the Bolognese and Roman baroque painters. From these sources Tiepolo created and refined his superbly dexterous and decorative art. In such ceiling paintings as the *Institution of the Rosary* (1739, Venice, Gesuati) and the *Transportation of the Holy House to Loreto* (1743-1744, Venice, Scalzi), Tiepolo established the formula for the Venetian rococo. Spacious and delicately symmetrical

*APOTHEOSIS OF THE SPANISH MONARCHY*

*Detail of a ceiling fresco executed by Giovanni Battista Tiepolo for Charles III of Spain*

compositions of many dramatically foreshortened figures, seen from below and developed to dizzying heights in illusionistic perspective, are painted in his exquisite, pale tonalities. His fame quickly spread from Venice to the mainland. Between 1726 and 1761 he executed many important commissions for churches and palaces in Udine, Milan, Bergamo, Vicenza, and Verona. In 1750 he was summoned to Bavaria by the Prince-Bishop of Würzburg, where with his sons he decorated the throne room and stair hall of the palace. In

1757 he returned to Venice and in 1758 was elected first president of the Academy of Painting and Sculpture. In 1761 he was called by Charles III to Madrid where, again with his sons, he worked on the decoration of the new royal palace until his death on Mar. 27, 1770.

Tiepolo's easel paintings are relatively few in number in comparison with his countless brilliant drawings, assiduously collected and preserved by his friend, Count Algarotti. As an etcher he is best known for the ten plates of the *Capricci* and the twenty-one *Scherzi di Fantasia.* Of his two painter sons, Lorenzo (1736-1776) continued his father's manner in Madrid, while Giovanni Domenico (1727-1804), returning to Venice, maintained the family tradition in a somewhat drier manner, affected by the nascent Neoclassic movement. He was also an etcher and published many plates after his father's compositions. G. H. H.

**TIERCERON.** *See* Architectural Terms.

**TIERRA DEL FUEGO** [tyɛ'rrɑ thɛl fwe'go], an archipelago at the extreme tip of South America, separated from the continental mainland by the Strait of Magellan. The area of approximately 28,000 sq. mi. is divided between Chile on the west and Argentina on the east by a line through 68° 34′ W. long. On the south and west of Isla Grande (or Tierra del Fuego) are many small islands. Staten Island (Isla de los Estados) belongs to Argentina. Picton, Nueva, and Lennox islands are claimed by both Argentina and Chile. The larger islands belonging to Chile are Navarino, Hoste, Dawson, Clarence, Santa Inés, and Desolación. The climate is cool, stormy, and wet. Forested and snow-clad mountains reach elevations of over 7,500 ft. Along the strait and on the southern coast, rich peat soils support vast areas of steppe grasses, used for sheep grazing. Of a total population of approximately 7,200 Scots, Yugoslavs, and Spaniards, Porvenir (Chile) has 2,000 and Ushuaia (Argentina), the world's southernmost town, has under 2,000, of whom half are confined in the penal settlement. The native Yagan and Ona Indians have almost disappeared. P. E. J.

**TIFFIN** [tr'fɪn], a city in northern Ohio, county seat of Seneca Co., situated on the Sandusky River in the center of an agricultural area, 80 mi. southwest of Cleveland. Natural resources of the region are oil, limestone, and dolomite stone. Founded in 1821, Tiffin was incorporated as a city in 1835. The community is governed by a mayor and council. A feature of historic interest is Fort Ball, one of a chain of forts erected during the War of 1812. Tiffin is the seat of Heidelberg College and Tiffin University, a business college. The Tiffin State Hospital for mental diseases is in the city. Transportation is afforded by the New York Central, the Pennsylvania, and the Baltimore & Ohio railroads. Highly diversified manufactures include machine products, electrical machinery, motors, grinding wheels, brass and bronze castings, copper wire, burial vaults, church furniture, sanitary pottery, and dairy products. Pop. 1950, 18,952.

**TIFLIS.** *See* Tbilisi.

**TIFTON,** a city in south central Georgia, the county seat of Tift Co., located about 85 mi. south of Macon. Founded in 1889 and incorporated in 1890, the city has the council-manager form of government. Tifton is the seat of Abraham Baldwin Agricultural College and the Georgia Coastal Plain Experiment Station. Tobacco, peanuts, cotton, corn, melons, and flowers and plants are grown extensively in the fertile countryside surrounding the community. Livestock and bees are also raised, and large quantities of bees and plants are shipped from Tifton, which has rail service provided by the Atlantic Coast Line and Southern roads. The local industrial establishments include lumber, chemical, peanut, and tobacco-stemming plants, cotton and cottonseed-oil mills, and a packing house. Pop. 1950, 6,831.

**TIGER,** a large striped cat, *Felis tigris,* of Asia. It is the largest known cat, males of the Siberian species attaining a length of 14 ft., and exceeding in weight the largest lion. Several races occur, varying chiefly in size and color. While greatly reduced over their former abundance, tigers in the period following World War II were still widely distributed in Asia, from the tropical bamboo jungles of Malaysia to the snow-swept plains of Siberia. They differ only in thickness of coat, all possessing the characteristic black stripes on a yellow background. The tiger is more powerful, and certainly more ferocious, than the lion, and the loss of thousands of lives has been attributed to it. Man-eaters are usually old tigers that find it easier to stalk and kill a human rather than to attack another beast.

YLLA

*TIGER,* FELIS TIGRIS

Tigers are solitary animals, usually dwelling near a watercourse. They are adept swimmers. Their food consists of the water buffalo, antelope, cattle, or even native dogs, although when pressed by hunger the tiger will take frogs and other small animals. The tigress has two to six cubs a year, usually three. She cares for them until they are about three years old. Once abundant in northern China, the tiger has been hunted until it has almost become extinct. The thick winter coat is valued at a high price in the fur market. The Chinese impart a high value to the carcass, believing that the bones, blood, heart, and flesh have rare therapeutic values. The heart of the tiger is supposed to impart to the consumer the courage and strength of the tiger itself. The tiger thrives in captivity. Hybrids resulting from a mating of a lion with a tiger have been bred. W. J. Ha.

**TIGER BEETLE,** the name given to any member of the family Cicindelidae, in the order Coleoptera. The tiger beetles are predaceous upon other insects and are provided with long legs that enable them to run swiftly over the ground. Their jaws are long and strong. They are alert and

wary and take to flight readily, but they usually fly only short distances. The larvae live in tunnels in the ground, where they await passing insects. The larvae are provided with a pair of forwardly directed hooks on the posterior third of the body that prevent them from being dragged from the tunnels by their prey. C. H. Cu.

**TIGER CAT.** *See* MARGAY.

**TIGERFLOWER,** a common name given to any plant of the genus *Tigridia* of the iris family. They are bulbous herbs native from Mexico to Chile. *T. pavonia* is frequently cultivated for the brilliance of its flowers. The narrow stem, to 2½ ft., bears alternate leaves and leaflike spathes bearing large red flowers spotted with red and purple markings. The flowers are fugacious, lasting only one day and succeeded by others. There are many horticultural varieties of the tigerflower. Bulbs planted in late spring will bloom in July or August. The corms should be lifted before the frost and stored in a dry place over the winter months. C. R. Eb.

**TIGER LILY.** *See* LILY.

**TIGER'S EYE,** or crocidolite, a variety of amphibole. It is a fibrous asbestos-like mineral, a silicate of sodium and iron, $NaFe(SiO_3)_2 \cdot FeSiO_3$. Some calcium or magnesium may enter into the composition. Crocidolite has a hardness of 4, a density of 3.20. The mineral crystallizes in the monoclinic system. In fibrous form the mineral has a mean index of 1.687. Crocidolite, which is blue in the asbestos state, becomes a hard golden-brown or brown mineral when replaced by ferruginous silica. The mineral in this form can be cut and carved to bring out the chatoyant effect to which the name tiger's eye has been given. Tiger's eye crocidolite must not be confused with one variety of the mineral chrysoberyl which is known as cat's eye. Here, the chatoyancy is due to structural differences within the mineral which are in no way akin to the fibrous structure which characterizes crocidolite. This semiprecious gemstone is obtained from Griqualand, South Africa. A. E. A.

**TIGER SHARK,** *Galeocerdo arcticus,* a large cosmopolitan shark, in the family Carchariidae. It is identified by the sickle-shaped teeth with serrate edges which are alike in both jaws. One of the largest sharks, it has been reported to reach 30 ft., although it is rarely over 20 ft. The tiger shark is found in warm oceans and, in the Atlantic, strays northward to Cape Cod. This voracious creature eats almost any kind of animal life, including other sharks, and is distinctly dangerous to man. It may bear as many as 57 living young. Its very tough skin is made into leather and the liver yields a valuable vitamin-bearing oil. A specimen 14 ft. long and 1,382 lb. in weight was taken on rod and reel off Australia. E. C. R.

**TIGRIS** [tai'grɪs], an important river of the Near East. About 1,150 mi. long, it rises in southeastern Turkey in Lake Gölcük, from which it flows, as the Dicle Nehri, in a generally southeastward direction. It forms a borderline at northeastern Syria and then, as the Tigris, continues across the entire length of Iraq, joining the Euphrates in southern Iraq, north of Basra, to form the Shatt al 'Arab, which flows into the head of the Persian Gulf. There is evidence, however, that in Sumerian times the river flowed in a more westerly channel, closer in its lower course to the Euphrates, with which it was connected by canals, some of which remain. The two large rivers have always been the water supply of semiarid Mesopotamia. The Tigris is swifter than the Euphrates and more important commercially, for much of it is navigable by flat-bottom river boats, permitting extensive local trade. Below Baghdad, cargoes are carried by river steamers, which connect with the modern railway terminus as the barges of old did with the caravan routes from the East.

The ruins of Nineveh, capital of ancient Assyria, lie on the banks of the Tigris, which was undoubtedly one of the avenues of attack used by the Babylonians and their allies in their destruction of the city in 612 B.C. The conquering Romans also made use of the Tigris when Emperor Trajan traversed the length of the river in his rout of the Parthians (A.D. 115-117). Among other ruins on the river are those of Seleucia, Calah, and Ctesiphon, which regained prominence during World War I as a battle site of the British Mesopotamian Campaign. The important modern towns on the Tigris, from north to south in Iraq, are Mosul, Samarra, Baghdad, and Kut al Imara. J. E. F.

**TIHWA** or **URUMCHI** [di'hwɑ', uru'mtshi], the capital of Sinkiang Province, in northwest China, located in an oasis on the Urumchi River, north of the Tien Shan range, about 300 mi. southeast of Tahcheng (on the border between Sinkiang and the Soviet Union) and 300 mi. northwest of Hami. The city has a continental desert climate with bitter cold, dry, windy winters and hot, dry summers with occasional showers. Since the source of atmospheric moisture for the Tihwa area is the distant Atlantic Ocean, only a few inches of rain fall annually; but the spring run-off of ice and snow from the near-by mountains and the ground water seepage forming springs along the foot of the mountains provide enough moisture for the fertile and productive oasis in which the city is situated. Tihwa has always been an important juncture of caravan routes from Siberia, India, and the west. The city's residents represent a racial mixture of Turks, Chinese Mohammedans, Mongols, and Chinese of the Han race. The Chinese influence reached Tihwa as early as 122 B.C. when Wu Ti of the Han Dynasty conquered the eastern section of Sinkiang. During the Mohammedan Uprising in Sinkiang (1862-1877) the Manchu emperor suppressed the revolt, and as a result in 1882 Sinkiang was formally proclaimed a province of China, with Tihwa its capital. The modernization of Tihwa did not commence until after the first decade of the twentieth century. The first telegraph line reached the community in 1913 and its first radio station as late as 1930. The city's educational institutions include Sinkiang Provincial College. Economically, Tihwa is an important agricultural, mining, and trade center for Sinkiang. To the immediate northwest, near Suilai, rice is grown in large quantities. Coal is found near Tihwa at Shuimokow and Toutungchang; petroleum at Ssupenkow and Sutachang; and silver and copper at Chai-o-pao. Tihwa's industries include tanneries, flour mills, and power plants. The city serves as a market and distribution center for furs and skins, wool, carpets, livestock, and gold. Pop. 1947, 69,991. A. C. T.

**TIJUANA** or **TIA JUANA** [tihwɑ'nɑ, ti'ɑ hwɑ'nɑ], a resort town in northwestern Mexico. It is located just south of the Mexican-United States border in the northern part of the state of Lower California. Tijuana is a favorite sporting center for American tourists, particularly during the racing season. Pop. 1940, 16,486. A. L. R.

**TIKHON'KAYA.** *See* BIROBIDZHAN.

**TILBURG** [tɪ'lbɜrχ], an industrial town in the province of North Brabant in the southern Netherlands, 60 mi. southeast of Amsterdam. It became a town in 1809, during the French period, when it was elevated to that rank by King Louis of Holland, the brother of Napoleon. It is known for its important wool and textile industry and leather factories. The Wilhelmina Canal, built in 1920, contributed greatly to the prosperity of the town. In the early nineteenth century Tilburg was the residence of King William II of the Netherlands, whose palace is now used as the town hall. Pop. 1952, 124,545. B. L.

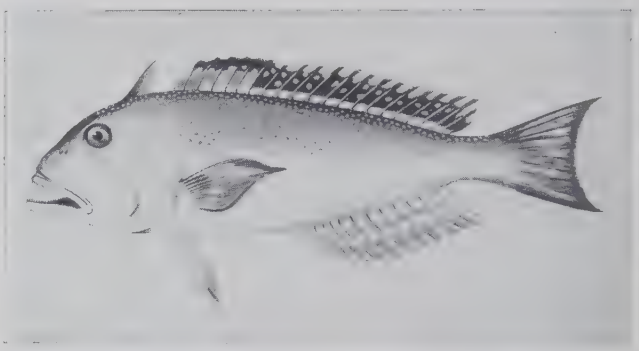
**TILBURY,** a town on the boundary of Essex and Kent counties, Ontario, Canada, 32 mi. east of Windsor, on Provincial Highways 2 and 98. It is served by the Canadian Pacific and the New York Central railways. Tilbury was incorporated in 1910. The surrounding area is well suited for the production of farm crops, especially corn, wheat, soybeans, tomatoes, beans, tobacco, and onions. The industrial products of Tilbury include canned goods, motor cars, furnaces, and dairy products. Pop. 1951, 2,682. D. F. P.

**TILDEN, SAMUEL JONES** (1814-1886), governor of New York and Democratic presidential candidate in the disputed election of 1876, was born at New Lebanon, N.Y., Feb. 9, 1814. He was educated at Yale University, and at New York University, where he graduated in 1837. He studied law at the latter institution, then called the University of the City of New York, and was admitted to the bar in 1841. In New York he quickly became a noted figure in Democratic politics. In the split among the Democrats after James K. Polk's election in 1844, Tilden was aligned with the anti-slavery group called "Barnburners." Thereafter until the post-Civil War period his influence in Democratic politics was slight. Meanwhile he won a distinguished reputation as a lawyer, particularly as counsel to railroads in process of reorganization. In 1867 he was elected a delegate to the New York State constitutional convention. He was also chairman of the Democratic state committee and began his long and successful fight against the Tweed Ring. He became a national personality and was chosen governor of New York in 1874. In 1876 he won the Democratic presidential nomination. In the election that followed, Tilden won a popular majority of 250,000, but lost the presidency to Rutherford B. Hayes by one electoral vote after a special electoral commission had been set up to determine the victor. His political activity thereafter declined. On his death he left a substantial bequest for the establishment of the New York Public Library. He died in New York City, Aug. 4, 1886. M. K.

**TILDEN, WILLIAM TATEM, II** (1893-1953), American tennis player, was born in Germantown, Pa., Feb. 10, 1893. He began to play tennis in his early boyhood, winning his first tournament at the age of eight. By the time he entered the University of Pennsylvania he was a nationally known competitor, and in 1913 he scored his first important victory by teaming with Mary K. Browne to win the national mixed doubles championship. In 1918, with Vincent Richards, he took the national doubles title, and in the following year he was runner-up to William M. Johnston in the national singles championship. Tilden won the singles title for the first time in 1920 and for almost a decade thereafter was the dominant figure in American tennis. In 1920 he was also a member of the Davis Cup team that brought the world championship trophy back to the United States from Australia, and he was the foremost player on the teams that successfully defended the cup until 1927, when it was lost to France. After holding the national singles title from 1920 through 1925, Tilden lost it to René Lacoste of France, although he regained it for a year in 1929. He was three times Wimbledon champion, and he won many lesser titles in the United States and abroad. In 1930 Tilden turned professional and won several national professional championships during the following two decades. He died in Hollywood, Calif., June 5, 1953. G. Q.

**TILE.** *See* Engineering Materials (*Brick and Clay Products*).

**TILE FISH,** *Lopholatilus chamaeleonticeps,* a large, bass-like fish in the family Malacanthidae, which possesses a large fleshy flap on the nape and a barbel at the corner of the mouth. This beautiful fish is colored green or blue above



COURTESY OF THE U. S. FISH AND WILDLIFE SERVICE

*TILE FISH,* LOPHOLATILUS CHAMAELEONTICEPS

and yellow or red on the lower sides. Its habitat is limited to the outer edge of the continental shelf along the east coast of the United States from Maine to Virginia. It lives in depths of 50 to 200 fathoms, but the best fishing is at 60 to 65 fathoms. Crabs are its main food but it also eats many other invertebrates and some fish. First discovered in 1879, it almost immediately became the support of an important fishery. It is delicately adapted to a narrow range of water temperatures of 47° to 50° F. In 1882, the population was reduced almost to extinction by a great kill due probably to a marked change in water temperature. It gradually increased until 1917 when about 11,500,000 lb. were taken in one year. Although an excellent food fish, the market demand has decreased to a point where relatively few are now taken commercially. It reaches a weight of 50 lb. E. C. R.

**TILL,** the unsorted, unconsolidated debris deposited by glacier ice. It consists of an unstratified mixture of boulders, sand, and clay. The boulders may be scratched or grooved due to rubbing while in transit in the ice. Tillite is the name given to ancient till that has been cemented into rock. K. K. L.

**TILLAMOOK.** *See* Indian Tribes, North American.

**TILL EULENSPIEGEL.** *See* Eulenspiegel, Till.

**TILLOTSON COLLEGE,** an accredited, privately controlled, coeducational institution of arts and sciences and a teachers college for Negroes, affiliated with the Congregational and Christian Churches of America, at Austin, Tex. It started in 1881 as the Tillotson Normal and Collegiate Institute. The present name was adopted in 1909, when college work was added. The Home Economics Division was added in 1930.

Degrees offered are the A.B., the B.S., and the B.S. in home economics and rural education. Two-year courses in elementary education and commercial studies are also available. Some dormitory facilities and limited scholarships are provided. *For statistics see* COLLEGES AND UNIVERSITIES.

J. R. To.

**TILLSONBURG,** a town in Oxford Co., Ontario, Canada, 153 mi. northeast of Windsor, 103 mi. west of Niagara Falls, and 16 mi. north of Lake Erie. It is on Provincial Highway 3, and the Canadian Pacific, the Canadian National, the Wabash, and the New York Central railways furnish rail facilities. Early settlement was attracted by the available water power of the Otter Creek. Sawmills and gristmills were the first industries of the community. Powdered milk, butter, cheese, boots and shoes, barrels, garden tools, heavy machinery, furniture, and tobacco products are the town's chief products. Pop. 1951, 5,330. D. F. P.

**TILLY, GRAF VON (JOHAN TSERCLAES)** [tɪ'li] (1559-1632), Bavarian military commander, was born at Castle Tilly, Duchy of Brabant, in 1559. Although educated as a Jesuit, he served with the armies of Spain, Austria, and Bavaria. He distinguished himself in the Austrian campaign against the Turks in 1602. In 1610 he entered Bavarian service as General Field Marshal and ten years later became commander-in-chief of the forces of Maximilian I, Duke of Bavaria, head of the Catholic League. Tilly's victories in the course of the ensuing Thirty Years' War won him military fame throughout Europe, and he was made a count in 1622 after his victory at Höchst. The atrocities of his troops against the inhabitants of Magdeburg after its capture in 1631 and Tilly's complete sack of the city were the greatest single outrage in the entire war. After Wallenstein's dismissal, Tilly commanded the united imperial and league forces. He was decisively defeated by Gustavus II Adolphus in the Battle of Breitenfeld on Sept. 17, 1631. Mortally wounded on the banks of the Lech while fighting the Swedes, he died Apr. 30, 1632, at Ingolstadt, Bavaria.

R. H. L.

**TILSIT** [tɪ'lzɪt], an industrial and commercial town on the northern border of the Kaliningrad (Königsberg) Okrug, administratively under the Russian Soviet Federated Socialist Republic, located in the western Soviet Union, 60 mi. northeast of Kaliningrad, at 55° 5′ N. lat. and 21° 55′ E. long. Situated at the mouth of the Tilse River, on the left bank of the Nemunas (Niemen) River, it lies east of the Tilsit depression. Developed in the early fifteenth century around a castle of the Teutonic Order founded in 1288, the town received civic rights in 1552. It was the site of the signing in 1807 of the Treaty of Tilsit. Occupied by the Russians for 17 days in 1914, it was a center of German pressure against Lithuania in regard to Lithuanian occupation of the Memelland between World Wars I and II. After several months of fighting and heavy damage to the town during World War II, it was captured by Soviet troops on Jan. 20, 1944. Tilsit was transferred from German to Soviet control by the Big Three Conference at Potsdam in 1945. Notable edifices include the sixteenth-century church of the Teutonic Order, the eighteenth-century parish church, and the eighteenth-century town hall; there are also a museum, botanical garden, and theatre. The townspeople trade in lumber, grain, leather, horses, cheese, and other agricultural products. Manufactures include wood products (especially cellulose), distilled spirits, beer, chemicals, yeast, machines, leather goods, iron, tobacco products, cheese, and soap. Pop. (est. 1950), 50,000.

**TILSIT, TREATY OF.** *See* FRANCE (*History*).

**TIMBER.** *See* ENGINEERING MATERIALS; INDUSTRIES, EXTRACTIVE (*Forestry Products*); LUMBER INDUSTRY; WOOD.

**TIMBRE, TONE COLOR,** and **TONE QUALITY** are terms used to describe that aspect of a sound which makes it possible for us to distinguish between a violin and an oboe, or between the different speech sounds. A simple tone has certain characteristics, such as pitch and loudness. The quality of a tone is a more complex phenomenon than either of these. The textbooks usually say that differences in quality arise from differences in the relative strength of the harmonics or overtones which go to make up the sound. For example, Dayton C. Miller in his *The Science of Musical Sounds* (1916) analyzed the sound waves of the standard orchestral instruments, and gave diagrams showing the relative loudness of the different harmonics. The diagrams are reasonably accurate so far as they go, but all such analyses assume that successive cycles of a sound wave are identical, and that therefore when a single cycle is analyzed into its composite elements, the resultant answer tells us what harmonics are "characteristic" of the entire tone. More recent experiments using electronic equipment seem to indicate, however, that the differences in successive cycles are not immaterial and accidental, but play an essential part in creating the quality. During World War II, the Bell Telephone Laboratories built an extremely elaborate apparatus for analyzing and recording sound waves. A report of some work done with this apparatus by Ralph K. Potter, and others, illustrated with numerous photographs of all the speech sounds, appeared in 1947 under the title *Visible Speech*. An examination of these photographs seems to indicate that the changes in the patterns of energy distribution may play quite as large a part in producing the quality as the harmonics themselves. In short, the timbre of a sound is a product of the harmonics present in that sound and of their changing patterns.

R. S. H.

**TIMBREL,** a term familiar largely from the Authorized Version of the Bible, where it denotes the Hebrew *tof,* a frame drum or tambourine.

W. Li.

**TIMBUKTU** or **TOMBOUCTOU** [tɪmbʌ'ktu, tɪ'mbʌktu'; tõ'bu'ktu'], a trading center of the French Sudan, in French West Africa, located near the great bend of the Niger River. Recent archaeological studies have revealed Egyptian architecture dating to prehistoric times, but more certain is the founding of the town toward the close of the eleventh century of the Christian Era by a native nomadic tribe called Tuareg.

A succession of dynasties controlled Timbuktu in the course of its history. The first two were native dynasties ruling from 1336 to 1433 and from 1433 to 1468. Then came the illustrious Songhai dynasty (1468-1528), inaugurated by Sunni Ali's bloody conquest of the town and characterized by the greatest extent and splendor the city ever knew. It was during this time that several mosques and the university were built and served as southernmost beacons of Islamic civilization. The Moroccan period (1590-1750) was initiated by the conquest under El Mansur, Sultan of Morocco. This period witnessed the decay of the city at the exploitive hands of the viceroys and through the plundering assaults of the Tuareg. Finally, in 1792, the Tuaregs once more held Timbuktu. During the fifteenth century the town carried on gold and salt trade with Europe via Tunis, Tripoli, and four caravan routes to Egypt, but it

subsequently declined in commercial importance and became known to Europeans as an almost legendary place. Nineteenth-century explorations rediscovered the town, and the French, expanding from Senegal, took it in December 1893.

The present town, populated mostly by Moslems, is not the city of Songhai times. French control has spurred the natives to rebuild houses and schools and to lay out new streets. A telegraph line links Timbuktu with Algeria. Salt trade, however, is still the principal economic activity. Pop. (est. 1949), 7,000. W. S. V.

**TIME.** The concept of time itself is seemingly incapable of definition, and such considerations are largely philosophic. This article is concerned with time as used in astronomy. For the adequate measurement of time it is necessary to have an ideal timekeeper of the highest accuracy by which to regulate timepieces. The most nearly ideal timekeeper is the earth's rotation, which is more uniform than the most accurate clock, with the possible exception of the quartz-crystal oscillator. The earth's rotation can be timed by observing the transit of a suitable celestial object over a particular meridian. A point on the celestial sphere is chosen, to mark the zero hour or beginning of a day, by the transit of that point over a given meridian; then the time at any other instant of the day is the hour-angle of the point at the instant. Time measure is really the measure of hour-angle or of earth rotation.

Astronomers recognize three principal kinds of time: sidereal, apparent solar, and mean solar. Other designations, such as Greenwich civil time, are subdivisions or different clock settings of the main types. The lengths of the units vary between sidereal and solar time, since the second, minute, and other dimensions of sidereal time are slightly shorter than the corresponding lengths of solar time; but in all divisions of solar time the second is of invariable length.

**Sidereal Time.** Sidereal time is nearly but not exactly "star time"; if a star is on the meridian at a certain moment, one turn of the earth on axis brings the star at exact transit over the same meridian. The interval between the two transits is the earth's rotation period, or 23 hr., 56 min., 4.099 sec. in mean solar time. Sidereal time, however, is measured by the diurnal motion of the vernal equinox and not by a star. A sidereal day at any place is the interval of time between two successive transits of the vernal equinox over the meridian of the place. This is shorter by 0.008 sec. than the earth's rotation period. Sidereal time is the hour-angle of the vernal equinox, and all places having the same longitude have the same sidereal time. When the vernal equinox is on an observer's meridian, his sidereal clock reads zero hours, minutes, and seconds.

Sidereal time is of use almost wholly in the astronomical observatory. The principal use is in connection with the determination of time from the stars. Another is the locating of an invisible object in the observatory telescope, using hour-angle and declination. The telescope is first set to the object's declination, and then to the hour-angle by the relation $t = \theta - \alpha$, where $t =$ hour-angle, $\theta =$ sidereal time, and $\alpha =$ right ascension. Also, sidereal time shows the vernal equinox's distance west of the meridian in hours, the right ascension of stars on the meridian, or the right ascension of other stars, as per formula above, and is a guide to the westward shifting of the stars at the rate of 2 hr. per month. It is likewise used by astrologers in their technical work.

**Apparent Solar Time.** Apparent solar time is measured by the diurnal motion of the actual sun on the celestial sphere. It is the time shown by the shadow on a sundial. An apparent solar day at any place is the interval of time between two successive lower transits of the sun over the meridian of the place. Apparent solar time is the hour-angle of the sun + 12 hr. (Before Jan. 1, 1925, an apparent day was the interval between two successive upper transits of the sun, and apparent time was the hour-angle of the sun. This point is of importance in using almanacs of date prior to 1925.)

The apparent solar day is divided into 24 hr., beginning with zero hour (0 hr.) at apparent midnight, when the sun is at lower transit. At apparent noon (12 hr. apparent time) the sun transits the upper meridian, and the shadow of a vertical object lies in a north-south line or meridian. Apparent days are not of the same length as sidereal days. If the sun and a star are on the meridian at the same moment, one sidereal day later the star will be in transit again; meanwhile the sun has moved eastward in its annual apparent motion along the ecliptic at about 1° per day. Hence, the sun transits about 4 min. later than the star, and a sidereal day is shorter than a solar day by 3 min. 55.909 sec. of mean time.

The sun is not a very good timekeeper, because its apparent motion is not uniform along the ecliptic. Hence the solar days vary in duration, and sundial instruments are the only ones adapted to apparent time; clocks cannot well be regulated to it. There are two causes for the lack of uniformity of apparent time. First, the sun's apparent annual motion is not uniform, for the sun goes fastest when the earth is nearest the sun and slowest when the earth is farthest away, on account of eccentricity of the earth's orbit. The inclination of the celestial equator to the ecliptic also affects the case. The sun's apparent motion is along the ecliptic, not along the equator. But measurement of time involves hour-angle, which is measurement from the meridian and is marked at right angles to the equator, and not to the ecliptic. At equinox times, solar movement of 1° along the ecliptic is projected as less than 1° on the equator, since the two circles are at an angle; whereas at solstice times 1° along the ecliptic is the same when projected to the equator, for here the two circles are parallel.

Apparent solar time is used in connection with the sundial, setting up a meridian by the plumb-line method, and observations on the sun for meridian altitudes, or in general any observation on the true sun.

**Mean Solar Time.** Mean solar time is measured by the diurnal motion of the "mean sun" on the celestial sphere. In one form or another, mean time is the kind of time in ordinary use. In order to avoid the lack of uniformity of the apparent solar day, a fictitious body (mean sun) is assumed to have a uniform, eastward motion along the celestial equator and to complete a revolution in the same time that the real sun takes for an apparent revolution around the ecliptic—that is, one tropical year of 365.2422 days. A mean solar day is the interval of time between two successive lower transits of the mean sun over the observer's meridian, and mean solar time is the hour-angle of the mean sun + 12 hr. (Before 1925, a mean solar day was the interval between two successive upper transits of the mean sun over the observer's meridian.) The mean solar day is divided into 24 hr., beginning with 0 hr., or mean midnight. At mean noon or 12 hr., the mean sun crosses the upper meridian. A mean solar day has the length of an average apparent day throughout the year. The mean sun moves westward daily, because of earth rotation, with a uniform angular motion. Like the actual sun, it is also in motion eastward with respect to the stellar background, so that the right ascension of the mean

sun increases at a uniform angular rate, each day of mean solar time being precisely of the same length.

**Civil Time.** Civil time refers to the special use of mean time that begins its day at midnight. Civil time is the same as mean solar time, that is, in kind of time; but the use of "mean" has been largely abandoned, as it is apt to confuse matters with the situation before 1925, when the astronomer's mean-time day began at noon. The civil day begins 12 hr. earlier than the old astronomical day of the same date; for example, 21 hr. astronomical time for June 18, 1924, equals 9 A.M. civil time for June 19.

All the kinds of time discussed so far are local, meaning that time for an observer at a given meridian is the true time at that meridian only. At any other meridian to the east, the time is later on the clock face than on the given meridian; and at any meridian to the west, the time is earlier on the clock. Time, so to speak, goes around the earth westwardly at the rate of 15° of longitude per hour, or 1° per 4 min. of time. The mean solar time of a particular point (and of its meridian throughout) is known specifically as the local civil time (L.C.T.) of that meridian. Each different meridian, varying by the least amount, has a different local civil time at any one moment. This kind of time is not used by timepieces in civil life.

The local civil time of the Greenwich meridian is called Greenwich civil time (G.C.T.) by many astronomers, and its beginning, 0 hr., occurs at midnight. Before 1925, the astronomers used Greenwich mean time (G.M.T.), beginning at noon, but the term has been largely abandoned (especially in the United States) in favor of G.C.T. in order to distinguish between days beginning at noon and at midnight. If an astronomer in the British Isles now wishes to designate the day beginning at noon, he calls it Greenwich mean astronomical time (G.M.A.T.). The term universal time (U.T.), in use among professional astronomers, is synonymous with G.C.T., which is still used extensively in navigation.

**Equation of Time.** The equation of time is a small numerical quantity of importance in astronomy and mathematical geography. It is not an equation but an interval of time, stated as plus or minus. The nonuniformity of apparent time brings about a constantly changing difference between apparent and mean time, and the equation of time is the difference in hour-angle, at any moment, between the real sun and the mean sun, that is, the difference between apparent and mean time, or the difference in right ascension of the true and mean suns. At times, the apparent sun is ahead of the mean sun, and at other times it is behind, varying from 0 to 16 min. "Ahead of" signifies greater hour-angle or westward diurnal movement, and hence an earlier meridian transit. The equation of time is used in two different forms ("mean minus apparent" and "apparent minus mean"); and authorities differ as to the form to be used. In most cases a writer uses the equation in one form only, disregarding the other. Some texts have completely reversed their former definitions. The value of one—at any instant—is the same as in the other, but the sign is changed.

*Mean Minus Apparent.* The mean minus apparent ($E_{m-a}$) form of the equation of time is the correction applied to apparent time in order to obtain mean time. It may be plus or minus at any moment. When the mean sun is "ahead of" the actual sun, mean noon occurs before apparent noon, the mean sun transiting the meridian before the real sun. This is the "sun slow" phenomenon. At a particular location, the local civil time would be greater on the clock face than a sundial would show, and the equation of time, $E_{m-a}$, is plus. But when the mean sun is "behind" the real sun, mean noon occurs after apparent noon, the sun itself transiting before the mean sun, giving the "sun fast" condition; here local civil time shows a lesser time than a sundial does, and the $E_{m-a}$ is minus.

The values of the equation of time for a certain day of the year vary by a number of seconds from year to year; but the pattern is the same, with a zero value four times a year, about April 15, June 14, September 1, and December 25. Exact values are supplied in most almanacs and ephemerides, but one must note whether $E_{m-a}$ or $E_{a-m}$ is given. $E_{m-a}$ is used in sundial reading, also in observing the sun's meridian transit, and in general for determining the civil time from apparent.

*Apparent Minus Mean.* The apparent minus mean ($E_{a-m}$) form of the equation of time is the correction applied to mean time in order to obtain apparent time. When the apparent sun is ahead of the mean sun, there is the "sun fast" condition and the sign of $E_{a-m}$ is plus; and when the apparent sun is behind the mean sun, the "sun slow" effect occurs, and $E_{a-m}$ is minus. One of the main uses of the apparent minus mean form of the equation of time is in navigation, and nautical almanacs tabulate the equation in this sense. Astrology also uses $E_{a-m}$ in order to convert civil time into apparent solar time.

**Standard Time.** A person traveling to any extent begins to encounter the effect of difference in local time. If an entire country set the clocks on local time, there would be a multiplicity of different time readings for a given moment; only the clocks along a meridian would keep the same time. In 1883, the United States adopted the system of standard time (invented by Dr. Charles F. Dowd), by which the country is divided into four zones, the clocks over a whole zone reading the same time to the second. The standard time so used is the local civil time of the standard-time meridian for a particular zone. In the United States, the last four of the following table are in use:

| *Zone* | *Central Meridian* | *Hours Earlier than Greenwich* |
|---|---|---|
| Atlantic standard time (A.S.T.) | 60° west | 4 |
| Eastern standard time (E.S.T.) | 75° west | 5 |
| Central standard time (C.S.T.) | 90° west | 6 |
| Mountain standard time (M.S.T.) | 105° west | 7 |
| Pacific standard time (P.S.T.) | 120° west | 8 |

Canada uses the five zones and also the 135th-meridian time or Yukon standard time, 9 hr. earlier than Greenwich. There is also a Newfoundland standard time, 3 hr. 30 min. earlier than Greenwich. Alaska has four zones, those centered on meridians 120°, 135°, 150°, and 165° W. long. Mexico, though located geographically mostly within the 105th-meridian belt, uses 90th-meridian time except in part of Lower California.

The standard-time zones theoretically should be bounded by straight lines each 7½° from the central meridian; but practically they vary considerably from the ideal, mostly to accommodate railroad schedules. Standard-time boundaries in the United States are controlled by the Interstate Commerce Commission.

*Zone Time.* Zone time is the standard-time system applied to the entire globe, and is the navigation term. Zone 0 is centered on the Greenwich meridian. Zones west of it are marked +1, +2, and so on; those to the east, −1, −2, and so on. Zone 12 surrounds the 180° meridian. The

number of a zone (with its sign) added algebraically to the civil time gives the corresponding Greenwich civil time.

*Advanced Time.* Advanced time is the technical designation of daylight-saving time, summer time, and others. It is not a different kind of time but only a different clock setting; it is still standard time. Advanced time used in a certain zone is the normal standard time of the zone immediately to the east. For example, clocks running on Eastern daylight-saving time are actually keeping 60th-meridian or Atlantic normal standard time. "Double summer time" in England causes the clocks to read 30th-meridian-east standard time (Eastern European time). Advanced time is more popular in cities than in rural communities. There is little advantage, if any, in advanced time for low latitudes or for high latitudes. It is unpopular on the farm, in the country in general, and in all scientific work. It should never be used in any records or work of scientific nature.

**International Date Line.** Since time moves, so to speak, westward around the earth, the effect is that the longitude of places where the local time is, say, 5 hr., increases westward continually; hence the 5-hr. (or any other) line may be thought of as moving around the globe. Consider the 0-hr. line. To the west of the longitude where local time is 0 hr., are the remains of the old day, whereas to the east of the 0-hr. line are early hours of the new day. Obviously, somewhere on the other side of the earth there must be a place where the date is changed abruptly. This place of change of date is the *date line* or international date line, an imaginary line in the Pacific Ocean, following the 180° meridian over much of its extent. At stations east of the date line the calendar day is one day earlier than at points to the west of the date line. As a person travels eastward, crossing the date line, his watch remains the same, but the date changes suddenly to one day earlier, causing him to repeat a day. As a person travels westward across the date line, the date changes suddenly to one day later, causing the traveler to omit a calendar day. In going over this critical line at sea, the practice is to change the calendar day at night, as if passing over it at midnight. *See also* CALENDAR; CLOCKS AND WATCHES; ELECTRONIC CIRCUITS (*Electric Oscillators*); OBSERVATORIES (*Work of Government Observatories*); SEASONS; SPACE AND TIME. H. S. R.

**TIME AND MOTION STUDY.** *See* INDUSTRIAL TECHNIQUES (*Industrial Scientific Studies*).

**TIMGAD** [tɪmgæ′d], ancient city of Numidia, 23 mi. east of Batna, Algeria, known in ancient times as Thamugas or Thamugadi. It was founded in A.D. 100 by Trajan through his legate L. Munatius Gallus and the III (Augusta) Legion, 14 Roman miles to the east of the site of the later camp of the III Legion at Lambaesis, at the meeting place of several routes. Controlling the outlets of the massive range of Mt. Aures to its south, it served as a settlement for veterans of the III and the XXX (Ulpia Victrix) Legion, a semifortress, a stabilizing influence upon neighboring native tribes, and a center of Roman culture in these remote parts. The founding is recorded in contemporary inscriptions on Trajan's Arch. The late date of the establishment precluded the city from mention in Classical authors; but its name appears in the official road-lists of the empire, and for a short space in Procopius' account of Justinian's wars. The local inscriptions yield fuller information.

Trajan's colony covered about thirty acres, sufficient for a population of about two thousand persons, but subsequent prosperity, aided by imperial favor, induced a considerable expansion. The life of the town lasted until its devastation in the Berber revolt of A.D. 534, after which it was restored with a strong castle, probably as part of Justinian's reorganization of the province; its history ends with the Arab invasion in A.D. 647. French excavations, beginning in 1881, have revealed the plan of both Trajan's small settlement, showing the typical rectangular form of a Roman camp, and the outlying quarters subsequently added and deviating from that street system; the house walls, made of small stones and mortar, now largely restored to a short distance above ground, contrast with the public buildings in cut stone, several of which it has proved possible to re-erect. The forum, temples, arches, theatre, library, churches, and mosaic pavements are characteristic of the time and civilization.

A. W. Van B.

**TIMISKAMING** [tɪmɪ′skəmɪŋ], a town in Timiskaming Co., Quebec, Canada, situated on the east bank of the Ottawa River, 41 mi. northeast of North Bay, Ontario, with which it is connected by the Ontario Provincial Highway 63. Quebec Provincial Highway 46 links the community with the mining region of northwestern Quebec. The Canadian Pacific Railway provides rail facilities. Timiskaming, which was incorporated in 1920, is important as the location of the Kipawa hydroelectric development. A large paper mill is the town's chief industry. The near-by Kipawa Lake region is noted as a hunting and fishing area. Pop. 1951, 2,787.

D. F. P.

**TIMIŞOARA** [ti′mishwɑ′rɑ] (Hung. Temesvár), a city in western Romania. The cultural and economic center of The Banat, it is located on the Béga Canal, about 250 mi. northwest of Bucharest and 25 mi. east of the Yugoslavian border. The city, founded in 1212 by Hungarians, was destroyed in 1242 by the Tatars. Captured by the Turks in 1552, it became the trade center of Turkish Hungary until 1716, when it was recovered by Prince Eugene of Savoy. Austria held it until, through the Treaty of Trianon, it went to Romania in 1921. Among the many churches within the city are the Roman Catholic and Greek Orthodox cathedrals, as well as several synagogues. It is the seat of a Roman Catholic and Romanian bishop. The city contains high schools, advanced trade schools, and a bank founded in 1906. Grains and the timber carried on the Béga Canal from the slopes of the Banat Mountains are the chief elements in the active trade of Timişoara. Its industries produce flour, tobacco, textiles, leather goods, metal wares, chemical goods, soap, and silk. Pop. (off. est. 1948) 111,987.

S. A.

**TIMMINS,** a town in Cochrane District, Ontario, Canada, situated on the banks of the Mattagami River, about 350 air mi. and 460 road mi. northwest of Toronto, on the Ontario Northland Railway. The town was named for Noah Timmins, one of the founders of the Hollinger Mines, who founded it in 1911. Timmins was incorporated in 1912. Its site was ideal; a dry sandy plain between the mine and the river, on which it was expected that five thousand people would make their homes. To house more than five times that number, the town has expanded into lower land to the north. It is the trade center for the Porcupine Gold Belt, a mining region covering several townships. Several large lumber mills are located along the Mattagami River near Timmins. Pop. 1951, 27,743.

D. F. P.

**TIMON OF ATHENS** [tai′mən] (c. 1605-1606), the most confused and incoherent play in the Shakespearean canon. The original text in the Folio is a medley of misprints, misnomers, inconsistencies, and contradictions, and all

the labors of modern editors have barely sufficed to make the action intelligible. The best explanation is that Shakespeare, perhaps shortly after completing *Lear,* began a play about the famous misanthrope Timon. Shakespeare had read of him in Plutarch's *Life of Antony* and possibly in a Latin translation of Lucian's *Dialogues,* used as a textbook in many English grammar schools. Timon, it seems, was a rich Athenian who squandered his fortune in gifts to false friends, and later, reduced to poverty, experienced from them the basest ingratitude. He then turned misanthrope and cursed mankind. While digging in the fields he discovered a buried treasure, and was once more besieged by flatterers, whom he drove off with threats and blows.

Shakespeare seems to have been engaged in the dramatization of this story when he was interrupted by the demand for a new play at court that resulted in the composition of *Macbeth.* He apparently left his unfinished manuscript in the hands of his fellow-actors, and some time after his departure to Stratford they turned it over to a hack-writer to finish and equip with spectacle and musical effects for a performance at Blackfriars. The elaborate stage directions show that the Folio text was printed from an official playbook, but there is no record of a performance; if there ever was one, it probably ended in failure. There is some reason to believe that this playbook was sent to the printers of the Folio to fill what threatened to be a gap in that volume, so that it is only by chance, as it were, that the play has come down to us. It would have been a pity if it had been lost, for it contains some magnificent poetry, particularly in Timon's invectives against mankind. Yet the theme is essentially undramatic, and it is quite possible that Shakespeare himself recognized this and never returned to his unfinished fragment of a play.

**TIMOR** [ti′mɔr; timɔ′r], the largest and easternmost of the Lesser Sunda Islands, in the Malay Archipelago, between Sawoe Sea on the west and Timor Sea on the east, about 400 mi. north of Australia. The eastern half of the island, together with the small exclave of Okusi Ambeno on the north coast of western Timor, belongs to Portugal, while the western part of the island, together with Flores, Soembawa, Soemba, Alor, Roti, the Sawoe Islands, and several lesser islands, forms the residency of Timor and dependencies in the Lesser Sunda Islands Province of the Republic of Indonesia. The residency has an area of 24,449 sq. mi. and in 1955 had an estimated population of 2,000,000; its capital is at Koepang, located on Timor. Portuguese Timor, the capital of which is at Dili, has a total area of 7,330 sq. mi., with a population (1950) of 442,378.

Timor itself is about 300 mi. long and 65 mi. at its widest point, covering an area of 13,094 sq. mi., with a population of about 1,200,000. The island is traversed by a series of parallel mountain chains, somewhat higher in the eastern portion, where they rise to about 7,000 ft. Volcanic activity is confined to mud geysers. The rivers are short and unimportant, of little use for irrigation and too swift for navigation. Prairies predominate on Timor and much of the land is sterile, but corn, rice, coffee, tea, sugar, cotton, and fruits are cultivated where the soil is rich. Native agriculture, however, is extremely primitive. Forest growth is scanty, but sandalwood, eucalyptus, rosewood, teak, and bamboo are found in sufficient quantity for export. There are two seasons, that of the southeast monsoon, from May to November, in which practically no rain falls, and that of the northwest monsoon during the rest of the year, when violent rainstorms prevail. The hottest regions are the coastal plains, where the average temperature is 80°-100° F. The population of the island includes Malay, Polynesian, and Papuan elements, divided loosely into the Belonese in the center and east, and the Timorese in the west. There are also some Chinese, Arabs, and Europeans.

**History.** The Dutch first came to Timor in 1613, but found, as elsewhere, powerful rivals in the Portuguese, who had already obtained power in the island in the course of the sixteenth century. Koepang was seized by the Dutch in 1618, but the Portuguese influence in the western portion of the island was not finally overcome until 1749. During the British occupation of Java (1811-1815), the Dutch portion of Timor also surrendered to England, but it was restored to the Netherlands after the fall of Napoleon. Agreements settling boundary disputes between the Dutch and Portuguese were concluded in 1859, 1893, 1898, and finally in 1914. During World War II Timor was occupied by the Japanese, and in December 1949 the residency of Timor was made a part of the newly formed United States of Indonesia, which in 1950 became the Republic of Indonesia. The eastern half of the island, together with the exclave of Okusi Ambeno, remained a Portuguese colony.

C. W. D.

**TIMOR SEA,** a shallow, tropical body of water separating Timor Island in the Malay Archipelago from the northwestern part of the continent of Australia. The Timor Sea connects the Arafura Sea on the northeast with the Indian Ocean on the southwest. R. G. B.

**TIMOTE.** *See* INDIAN TRIBES, SOUTH AMERICAN (*Other Linguistic Groups and Tribes*).

**TIMOTHY, ST.,** disciple and companion of St. Paul, mentioned a score of times in the New Testament, was born probably at Lystra in Lycaonia of a Greek father and a Jewish mother, Eunice. Converted, circumcised, and entrusted with difficult and confidential missions by Paul, he shared Paul's first captivity at Rome, accompanied him on his last missionary journey, and was placed by him over the Church of Ephesus. The authenticity of the two Epistles to Timothy was first seriously questioned in the nineteenth century, chiefly on grounds of internal evidence, but it has been defended by numerous Catholic and Protestant scholars, who date the letters in the period between A.D. 65 and 70.

W. C.

**TIMOTHY GRASS,** *Phleum pratense,* an important grass cultivated for hay in the eastern United States and Canada, also called "cat's-tail" and "herd's-grass." It is a native of Europe and Asia but is widely naturalized in North America. It is a strong-growing perennial with many long, flat leaves and a cattail-like flower spike from 1 to 8 in. long, at the end of smooth erect stems from 2 to 5 ft. high. Timothy grass will not stand pasturing and is primarily grown for hay. It thrives and is commonly planted with other crops such as red or alsike clover. The plant is open pollinated and seed is put on the market in a mixture of types; it is seldom available in a true selection. The price of seed is usually low in comparison with other grasses. About 10 lb. of seed with 4 to 6 lb. of other grasses is the usual amount sown per acre. It is believed that about 1720 seed was brought to Maryland from Europe by Timothy Hanson, whose name has been commonly given to this valuable hay and forage plant in America. C. K. H.

**TIMUCUA.** *See* INDIAN TRIBES, NORTH AMERICAN (*Southeast*).

**TIMURLANE.** *See* TAMERLANE.

**TIN,** symbol Sn (Latin, *stannum*), atomic number 50, at. wt. 118.7, density ($\alpha$-tin 5.75, $\beta$-tin 7.31), m.p. 231.89° C., b.p. 2,260°C. Tin has been found in Egyptian tombs; and deposits of the Tin Islands of Cornwall, the Cassiterides, supplied the ancient world. The fall of Carthage ended the tin trade, so that coins minted after this date contain increasing quantities of lead to replace the tin. Bronze, an alloy of copper and tin, was also known in ancient times.

**Forms.** Tin exists in three allotropic forms, alpha, beta, and gamma.

$$\underset{\text{(gray)}}{\alpha\text{Sn}} \overset{18^\circ}{\rightleftarrows} \underset{\text{(white)}}{\beta\text{Sn}} \overset{161^\circ}{\rightleftarrows} \gamma\text{Sn} \overset{232^\circ}{\rightleftarrows} \text{Sn (liquid)}$$

Gray tin has a cubic, diamond lattice; white tin, hexagonal; and gamma tin, rhombic. The transition from white to gray tin is slow at the transition temperature but at —50° C. it occurs within a few days; the transition is accompanied by an increase in volume, so that the product is powdered. This effect, known as tin pest, makes the use of tin inadvisable where subzero temperatures exist. For instance, the tin pipes of an organ in Leningrad, then known as St. Petersburg, crumbled to a gray powder during the cold winter of 1867-1868.

**Properties and Uses.** Tin is a white, soft, silvery metal of low tensile strength. At room temperature, it is brittle; but at about 100°C., it becomes malleable and may be rolled into tin foil and extended into pipes. Tin cry is a crackling sound emitted when a bar of tin is bent. Tin is used chiefly as tin plate, manufactured by dipping sheets of low-carbon steel into molten tin, or electroplating the sheet steel as it is passed through a bath. Ordinary pins are brass wire, coated with tin by displacement of the zinc in the wire by a tin salt. Tin plate, unlike galvanized zinc plate, does not give galvanic protection, since tin is higher in the electromotive series than iron. Forty per cent of the tin produced is used for tin plate and 22 per cent for tin-lead solder. Molten tin and lead are completely miscible and do not form compounds. Alloys of these two metals are differentiated as follows: 50 per cent tin is common solder; 33 1/3 per cent tin is plumber's solder; and 64 per cent tin is the eutectic, or alloy with lowest melting point (180° C.).

**Principal Compounds.** Tin forms stannous compounds with dilute or concentrated HCl, or dilute $HNO_3$; stannic compounds with hot concentrated sulphuric acid; and metastannic acid, $SnO_2 \cdot H_2O$, with concentrated nitric acid. With alkali hydroxides the tin dissolves to form stannites:

$$Sn + 2NaOH \rightarrow Na_2SnO_2 + H_2\uparrow.$$

Tin does not evolve hydrogen readily with acids because of high back electromotive force. Soluble stannic compounds are reduced to stannous by contact with tin.

*Stannous Oxide.* Stannous oxide, $SnO_2$, is prepared by heating stannous hydroxide, and burns in air to form a hydroxide. It is amphoteric, forming stannites and stannous salts with alkalies and acids, respectively. Stannous halides are prepared by reducing stannic halides with tin, or by dissolving metal in the halogen acid. Stannous hydroxide, $Sn(OH)_2$, is amphoteric. Like a base, it reacts with HCl to form $SnCl_2$ plus water; like an acid ($H_2SnO_2$), it reacts with KOH to form potassium stannite, $K_2SnO_2$.

*Metastannic Acid.* Metastannic acid, $H_2SnO_3$ (alpha stannic acid or stannic acid), is hydrated stannic oxide, $SnO_2 \cdot H_2O$. It is formed as a gelatinous white precipitate by the action:

$$SnCl_4 + 4NH_4OH \rightarrow 4NH_4Cl + H_2SnO_3 + H_2O.$$

Metastannic acid, upon heating, forms $SnO_2$, losing water. The sodium salt, sodium metastannate, $Na_2SnO_3 \cdot 3H_2O$, is a mordant and fire-retarding agent for cotton goods. The fabric is washed with the metastannate, then treated with ammonium sulphate; the ammonium stannate, so formed, hydrolyzes to stannic acid, which remains in the cloth and may lose the water to form stannic oxide.

*Stannic Chloride.* Stannic chloride is a heavy, colorless, fuming liquid, boiling at 114.1° C. It is prepared by heating tin in an excess of chlorine; in fact, the recovery of tin from waste tin plate depends upon this reaction, or upon a newer process using NaOH to form sodium stannite. Stannic chloride pentahydrate, $SnCl_4 \cdot 5H_2O$, is a mordant in dyeing, since it hydrolyzes on the cloth to produce colloidal, $Sn(OH)_4$. Other important tin compounds include ammonium chlorostannate $(NH_4)SnCl_6$, a mordant for cotton; and stannic sulphide, $SnS_2$, mosaic gold or gilt pigment.

**Analysis.** The oxide, $SnO_2$, has a crystal lattice like the mineral rutile. Fused with alkalies it forms the stannates, e.g., $Na_2SnO_3$, which are soluble in water; addition of acid precipitates $\beta$ stannic acid. This probably differs from meta or $\alpha$ stannic acid in its physical state. Hydrogen sulphide precipitates brown stannous sulphide, SnS, and yellow stannic sulphide, $SnS_2$, from dilute hydrochloric acid. In analytical chemistry, stannous and stannic sulphides are dissolved in yellow ammonium sulphide; both form the thiostannate $SnS_3^{-3}$, the stannous sulphide being oxidized by the polysulphide.

H. N. A.

**TINAMOU** [tɪ′nəmu], any one of a number of species of primitive New World birds that form a very distinct order in many ways intermediate between the ratites (ostriches and their allies) and all other existing birds. They are found from southern Mexico to Patagonia. Their size ranges from that of a small quail to that of a large domestic fowl. In general appearance they resemble the wholly unrelated partridges, although tinamou may at once be known from these by their thin bill, small head, and slender neck. Their plumage is generally a combination of browns and grays, often barred with black. Their eggs are remarkable, with the shells looking like polished metal or glazed porcelain and presenting such colors as yellow, green, blue, pink, and orange. These birds are easily snared, and many are exported from the Argentine to the markets of the United States, where they sell as South American partridge. H. G. De.

**TINIAN** [tiniɑ′n], one of the Mariana Islands between Guam and Saipan, located in the Pacific Ocean south of Japan and east of the Philippines at 15° N. lat., 145° E. long. The island belonged to Spain until 1899, when it was sold to Germany along with the rest of the Marianas, except Guam. Tinian was occupied by the Japanese during World War I and was retained as part of the Japanese Mandate, until its occupation by American forces in July 1944, during World War II. Tinian, because of its area of 50 sq. mi., its strategic geographical location on the southern approaches to Japan, and its rather level topography, was, like Guam and Saipan, an ideal site for basing very heavy bombers of the United States Strategic Air Force. It served as an important B-29 base for attacks on Japan during the last year of the war.

R. G. B.

**TINNEVELLY.** *See* TIRUNELVELI.

**TÍNOS** or **TENOS** [ti′nɔs, ti′nɒs], one of the marginal islands of the Greek Cyclades group in the Aegean Sea. It consists of two mountain systems with deeply serrated ridges, and the slopes, laid out in terraces, are covered with fields and vineyards. Tínos, the capital, occupies a picturesque site

on an open bay on the south coast. In the town is the Church of the Evangelistria, built over a well where, in 1823, a miraculous icon of the Virgin was found. The icon is kept in the church and was supposedly painted by St. Luke. Thousands of pilgrims gather at the shrine every year. The island has an area of 79 sq. mi. Pop. 1951 (town), 2,758; (island), 10,191. S. Van V.

**TINTAGEL** [tɪntæ′jəl], a village and parish in Cornwall, England, about 207 mi. southwest of London. It was once known as Bocyny, and according to an old legend King Arthur was born in the castle whose ruins stand on Tintagel Head, 300 ft. above sea level. In 1933 the ruins of a Celtic monastery were uncovered, indicating the site's use from very early times. The village is listed in Domesday Survey, and it had a charter which was surrendered to Charles II. A new charter was obtained in 1685. In 1784 the rector, as mayor of Tintagel, was the only voter qualified to send a representative to Parliament. In 1835 the village was made part of the county parliamentary district. Tourists create much of its business. Pop. approx. 1,300. A. W.

**TINTERN ABBEY** [tɪ′ntərn], a beautiful ruin of a former Cistercian abbey founded in 1131 by Walter de Clare, 5 mi. north of Chepstow in Monmouthshire, England. Located in a broad meadow on the right bank of the River Wye, the abbey forms one of the most romantic ruins in England. The church, which is the principal feature of the present ruins, dates from 1270-1325. The building, 228 ft. long, is an excellent example of Geometrical Gothic; the roof, tower, and north wall of the nave are missing. A notable attraction is the great east window, 64 ft. high, with lovely tracery, but other carved decorations are likewise beautiful. The little village of Tintern is near by. The locality is especially associated with William Wordsworth, who in 1798 composed one of his most famous poems a few miles above Tintern Abbey, on the Wye. R. Ne.

**TINTORETTO (JACOPO ROBUSTI)** [tɪntoræ′to, yɑ′kopo robu′sti] (1518-1594), Venetian painter, was born in Venice in the autumn of 1518, the son of Battista Robusti, a dyer, from whose occupation he earned the nickname Il Tintoretto ("the little dyer"). He probably was first influenced by Titian, but the tradition that he was expelled from the studio when his precocious drawings aroused the older painter's jealousy seems unlikely. He may have worked with Bonifazio Veronese, Andrea Schiavone, and Parmigianino. The most important factors in his development were certainly such aspects of the Venetian tradition as the idyllic landscape painting of Giorgione and the didactic narrative art of Carpaccio. Subsequently he was affected by Michelangelo's energetic treatment of the nude. He secured small casts of the Medici tomb sculptures from which he made many drawings, as well as from the antique and from small clay models drastically foreshortened. Whether or not he placed in his studio, as it has been claimed, the motto, "The drawing of Michelangelo (combined with) the color of Titian," the special qualities of both masters were merged, by 1548, in a more personal style in the *Miracle of St. Mark* (Venice, Academy), the first painting to attract the admiration of his contemporaries. The lengthy series of mural paintings for the Scuola di San Rocco, which was executed between 1559 and 1584, is very useful in the study of the gradual evolution of his style. Tintoretto's technique, although derived from the typical Venetian feeling for color pattern achieved through multiple glazes, became a most sensitive instrument for the presentation of his complex emotional and intellectual interpretation of religious history. The surface of the canvas, in places covered with a thick impasto, elsewhere lightly glazed or even bare, is the material counterpart of the tempestuous and excited design. In his treatment of space Tintoretto's characteristic schemes, based on deep and oblique diagonals, foreshadowed the Baroque solutions of the seventeenth century. The slender proportions of his figures, related to Florentine mannerism through Michelangelo, disturbed the

*MIRACLE OF SAINT MARK*

FROM THE PAINTING BY TINTORETTO

COURTESY OF THE NEW YORK PUBLIC LIBRARY

abstract and ample dignity of the Titianesque canon, even as his introduction of startling and often commonplace genre details into the most solemn incidents indicated his desire to interpret religious history in a more modern manner. In this he showed his awareness of the direction taken by the Catholic Counter-Reformation. His mythological and allegorical paintings for the Doge's Palace presented an active renewal of the Venetian insistence upon the sensuous pleasures of luxurious living. In 1590, when over seventy, he completed his vast *Paradise* for the Doge's Palace, the commission for which he had won in competition with several younger artists. In size, conception, and execution it challenges comparison with Michelangelo's *Last Judgment,* to which in a sense it is the Venetian equivalent. Tintoretto died in Venice May 31, 1594. G. H. H.

**TINY TIM,** the crippled, youngest child of Bob Cratchit in Charles Dickens' *A Christmas Carol* (1843), who helps to create the spirit of Christmas and to soften the heart of Scrooge. DeL. F.

**TIPPERARY** [tɪpərɛ′ərɪ] or Tiobraid Arann, the name of a town and county in Munster in the south central part of the Republic of Ireland.

**The Town.** The town of Tipperary is situated in the Golden Vale, near the Galty Mountains, in County Tipperary, 110 mi. southwest of Dublin. The town's name was derived from the Ara River, whose source is near by. Tipperary is an important dairy-farming center, and its industries include milk processing, glove making, knitting, and linoleum manufacture. Of interest is the gatehouse, which is all that remains of the friary erected by Henry III in the thirteenth century. Pop. 1951, 5,148.

**The County.** Tipperary, the only inland county of Munster, has an area of 1,662 sq. mi., of which 214 are water. It is bounded by the counties of Galway and Offaly on the north, Laoghis and Kilkenny on the east, Waterford and Cork on the south, and Limerick and Clare on the west. The county is divided into the North Riding and South Riding. In the central part, Tipperary is level, and the soil is very fertile, especially in the district known as the Golden Vale. The borders, however, are hilly. The Knockmealdown Mountains, with a highest elevation of 2,609 ft., extend for 15 mi. between Tipperary and Waterford; the Galty Mountains, with a highest elevation of 3,018 ft., are in the southwest; Slievenaman Mountain, 2,364 ft. high, is in the southeast; and the Keeper and Devil's Bit ranges extend for 18 mi. in a northeast-southwest direction along the southern part of the North Riding. The prevailing rock is carboniferous limestone. The principal rivers are the Shannon and the Suir. The town of Cashel was the ancient capital of the kings of Munster. On the Rock of Cashel, a limestone formation 300 ft. high, are the ruins of a thirteenth-century cathedral, and of Cormac's Chapel, the latest example of Irish Romanesque architecture, a style which was not used after the Anglo-Norman invasion in the twelfth century. Clonmel, the county town, was the native town of the novelist Laurence Sterne. Pop. 1951, 133,313. S. Van V.

**TIPTON,** a city in central Indiana, the county seat of Tipton Co., located 35 mi. north of Indianapolis. The tomatoes, corn, and beans raised in the vicinity are processed in Tipton, whose industrial output also includes sheet metal, poultry and hog supplies, piston rings, furniture, and chemicals. A mayor and council administers the community. Pop. 1950, 5,633.

**TIRANË** or **TIRANA** [tirɑ′nə, tirɑ′nɑ], the capital of Albania, located 18 mi. from the Adriatic Sea near the center of the country. The surrounding region is cultivated for farm products as well as olive and almond groves. Founded in 1600 by a Turkish general, the city has since 1920 been rapidly expanded and modernized, losing much of its original Turkish appearance. The government buildings, the

WIDE WORLD PHOTOS

*Government buildings in Tiranë, capital of Albania*

palace of the former King Zog, and a number of legations are in the city. Tirane has civil and military hospitals and several schools. Italy occupied the city in 1939, and it remained under Axis control until the withdrawal of German forces in November 1944. The city has a flour mill, brick factories, cement-block works, and printing establishments. It is connected by roads to most of the important cities of the country and by railroad with the coastal city of Durrës. Pop. 1945, 59,887.

**TIRE,** a band of solid rubber or inflated rubber and fabric casing, sometimes a rim of steel. The whole is placed around the rim of a wheel to absorb shock, reduce abrasive wear, and transfer through traction, the power of a vehicle to the surface of the road.

The pneumatic tire envelops and absorbs small objects in its path without raising the center of a wheel. A vehicle, equipped with metal tires, is lifted when it passes over any object; the degree of shock experienced by a vehicle with solid rubber tires encountering the same object is determined by the elasticity of the rubber. The use of a pneumatic tire reduces the shock to a minimum, for the compressed air within the tire is displaced for the instant, and the combined elasticity of the air and the rubber covering of the tire absorbs the shock.

Although pneumatic tires provide traction for the wheels and transmit the horsepower of a vehicle's engine to the road surface, it is equally important that the tires dissipate the energy of the vehicle when the brakes are applied. The tread, the part of the pneumatic tire that contacts the road, has engraved in it patterns that grip the road to provide traction and guard against straight-line or side skidding.

**History.** *Solid Tires and Early Air-filled Models.* The first crude forerunner of the pneumatic tire, as we know it today, was the invention of Robert William Thomson, an Englishman. In 1845, a patent was issued to Thomson for "the application of elastic bearings round the tire of wheels of carriages, rendering their motion easier and diminishing the noise they make while in motion." To accomplish this, he proposed using "a hollow belt composed of India rubber . . . and inflated with air, whereby the wheels will at every

part of their revolution present a cushion of air to the ground, or rail, or track on which they run."

Thomson's "Aerial wheels" were large—five in. in diameter, when used on a brougham. Their size and relative noiselessness attracted much attention. Thomson's solid rubber tires, which were as much as five in. thick, proved more popular, and the "Aerial Wheels" were forgotten. Solid rubber tires, built according to patents dating back to 1871, were introduced by the leading English rubber manufacturers in 1884. Their appeal lay in their quiet-running characteristics and traction. That same year, one company applied for a patent for a tire with a hollow center or with a spongy, porous center to give added resilience.

The growing popularity of the bicycle in the second half of the 19th century increased, on the one hand, the demand for solid rubber tires and, on the other, revived interest in air-filled casings. The first pneumatic tire for bicycles was developed by John Boyd Dunlop, a veterinary surgeon of Belfast, for his son's tricycle. The tire was a rubber and linen tube wrapped with tape and laced upon the rim of the tricycle wheel. It worked so well that Dr. Dunlop obtained patents for the tire in 1888 and 1889. On these patents, the Dunlop Pneumatic Tyre Company, Ltd., was founded.

The problem of how to fix a tire to the rim of a wheel, securely and reliably, was partially solved by Charles Kingston Welch. In 1890, he suggested that a tire be built with thick edges in its canvas cover or outer layer. In these edges, an endless wire could be sewed, forming a circle of wire that would fit tightly in the well of a metal rim, specifically grooved to hold it in place. The wearing surface or tread was vulcanized to the tire in a separate operation and cemented to the wire-fastened tire body.

William E. Bartlett devised the method of fastening tires to metal rims most often used on bicycles and early automobiles. In 1890 an English patent was issued for his "clincher" fastening. Instead of containing wire to hold the tire on the rim, Bartlett's casing had beaded edges that curved under the flanges of the rim. The pressure of air in the inner tube held the tire on the rim.

A parallel development was the single tube or "hose pipe" tire which was built by wrapping layers of rubber-impregnated fabric on a stick or mandrel. After the stick had been removed, the tire was cured and its ends cemented together. This type was widely used on bicycles and on the earliest American cars equipped with pneumatic tires. The single tube remained in favor on bicycles, light carriages, and sulkies. In both the United States and Europe, however, the clincher tire was preferred for automobiles. In 1903, tire manufacturers agreed to standardize the contours of tires and rims, so that they would be interchangeable.

The early clincher tire was round in cross section. In 1904, the first straight-side pneumatic tires were manufactured. They had a wire cable in the bead or edge. When the tire was clamped to the wheel by bolted rim flanges, the inextensible wire kept it from expanding and loosening. Improvements were made so that it was less liable to pinch the inner tube.

Early in the twentieth century, several improvements were made in tires. One that was generally adopted by manufacturers originated with John E. Palmer, an Englishman. He introduced a kind of fabric which proved superior to the cross-weave canvas or linen then in use. According to Palmer's design, the fabric was made of cotton threads all laid in the same direction and embedded in rubber. The fabric was cut into strips of desired width, with the ends slit on a bias angle. A strip was wound on the core of a tire-building drum, and another strip was wound so that its threads would run in the opposite direction. This method of tire building, manufacturers found, provided the maximum strength of the tire cord body in all directions subject to stress.

The first non-skid tread—NON-SKID was engraved in the tire tread, at an angle to the center line of the tire—was introduced by Firestone in 1908. Diagonal bars, grooves, and knobs became the principal types of tread design. These designs, engraved on the tire during vulcanization, make available hundreds of small edges of tread rubber which grip the surface of the road, providing traction. They also catch surface water on wet pavements, permitting the tread rubber to roll on a relatively dry surface.

During the early days of the automobile industry, tire manufacturers endeavored to develop longer-wearing tires; by 1910, they could guarantee 4,000 mi. The tire size became larger, as more plies of fabric were added to increase tire strength—as many as 14 plies were not uncommon. With a large number of plies, however, the tire became heavier and less resilient.

*Balloon Tires.* The balloon tire was commercially introduced by The Firestone Tire & Rubber Company in 1922. Its development was dependent on adhesion of the body plies and tread and on a greater resilience in the cord body, which were obtained by dipping the cord fabric in a rubber solution before it was embedded in solid rubber. This process is commonly referred to as gum dipping. With its lower air pressure, but greater air volume, the balloon tire had a lower bursting stress to withstand. The casing could be made lighter, four plies of resilient cord taking the place of eight or more stiff plies. The balloon tire had a larger diameter and sidewall height than the earlier high-pressure tires. Its thinner walls deflected to a greater degree under shocks of the road, and the wider tread rolled more smoothly over bumps and obstructions. Vibration and road shock were absorbed by the resiliently encased cushions of air, and motorists could drive at higher speeds with less threat of punctures, because the soft tires yielded to obstructions that would have pierced a taut casing. The balloon tire in general use today has a nonskid tread. Manufacturers work to develop better designs to improve traction and guard against the danger of skids.

Balloon tires have proven to be more flexible and easier to handle even in the factories. Manufacturers who had been shaping tires on drums fitted with steel cores, could build them now on flat drums and the tire could be formed by air pressure into doughnut shape before vulcanization, equalizing the stresses on the cords. By 1928, the tire industry had switched completely to the flat-band method of manufacturing on cylindrical drums.

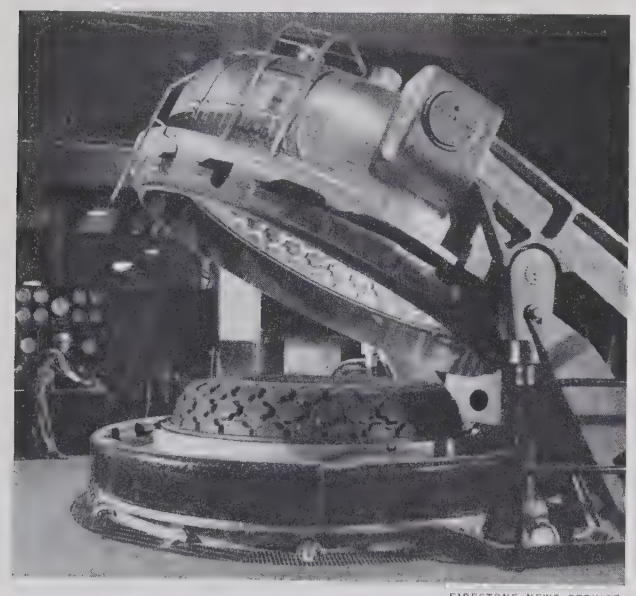
Among the major tire developments in the past 25 years have been: tire cords made of synthetic fabrics, such as rayon, introduced in 1933, and nylon; tire cords of rubber-covered steel wire for truck and bus tires; synthetic rubbers, which have increased tread mileage and air retention; the super-balloon tire, which operates at an even lower pressure than the balloon tire. The diameter of rims used on cars and trucks have decreased, allowing a lower center of gravity so that the vehicle holds the road and handles better. The stronger cord fabrics often outlast the tire body. As a result, "retreading," the application of new tread rubber to a used tire body at temperatures low enough not to damage the tire body, has been developed.

Special tires have been created for airplanes. They are strong, light-weight, and resist the tremendous shock of

landing impact. They must roll safely along runways at high speeds without the treads tearing off. Jet airplanes, for example, land at speeds up to 250 mph.

In 1954, tubeless tires became available for automobiles and, in 1955, they were adopted for heavy trucks. As its name implies, the tubeless tire substitutes a lining of rubber for a separate inner tube. The lining is made of synthetic rubbers because of their good properties of air retention. Since the liner is an integral part of the tire, the tire itself becomes the container for the air under pressure. The tubeless tire is claimed to provide greater protection against punctures and blowouts and longer mileage. Heat is an enemy of tire life. The tubeless tire, being lighter, runs at lower temperatures than a tire and tube. The tubeless truck tire is considerably lighter than its tubed counterpart, allowing more cargo to be carried without increasing overall weight.

**Manufacture.** The strength of a tire and its ability to throw off heat generated by high speeds are due largely to the kind and quality of fabric used in its construction. The tire body consists of several layers of nylon or rayon cord bonded together and overlaid with the tread. Fabric makes up about 12 per cent of the weight of a passenger car tire and 15 per cent of a truck tire's weight.



FIRESTONE NEWS SERVICE

*In the world's largest tire-vulcanizing machine green rubber is cured and tread and sidewall patterns impressed.*

Tire compounds are made of latex or synthetic rubber, sulphur, carbon black, oils, and other chemicals. They are used to impregnate cotton, rayon, or nylon cord to produce cord fabric plies, or, if extruded, to form the tread and sidewall rubber layers. The quantities of other materials used determine the special characteristics of the rubber, whether it will be, for example, a pliant sidewall rubber or a very tough, abrasion-resistant tread. The rubber used in impregnating the fabric is different from that in either sidewall or tread.

In the manufacture of tires, rubber is cut into pellets, then weighed with exact amounts of carbon black and pigments. A conveyor carries the rubber and other ingredients to a chute that leads into a Banbury mixer. Liquid chemicals are added. After thorough mixing, the batch is pelletized a second time. Sulphur, accelerators, and other powdered chemicals are weighed and conveyed with the rubber into another Banbury mixer.

The mixed or "compounded" batches of rubber are dropped into mills where the rubber is rolled into thick sheets which are cut off in strips. It is then ready to be made into the different parts of the tire.

Rubber stock is kneaded and heated on warming mills to make it more workable. Stock for use in treads and sidewalls are conveyed from the warming mills and fed into two opposing extrusion machines. Both stocks are extruded through one die, the tread stock through the central portion and the sidewall stock through the outer edges of the die, so that they are welded together as a single unit. After weighing and cooling, the extruded tread and sidewall rubber is cut to proper lengths ready for use in building the different sizes and types of tires.

Rayon and nylon cords are dipped in a special rubber liquid compound and dried. Calendering follows. Rubber from warming mills is automatically fed into the rolls of the calendering machine, which presses it onto both sides and in between the cords. The calendered fabric is rolled into cloth liners to prevent sticking and is cut "on the bias"—diagonally across the cords. The pieces are turned, laid end to end, and spliced into a continuous strip. The result is a strip of material cut to a specific width, with all the cords running in a diagonal direction.

In the preparation of rubber-covered steel wire cords, a number of strands of steel wire are brought together from reels and guided through a die, where rubber stock is squeezed around and between the separate strands. The rubber-covered wire is wound around a ring several times in a bead-building machine; the number of revolutions is determined by the size and type of tire being made. The bead is then covered with a strip of fabric called a "reinforce," which ties the bead into the tire, giving the latter extra strength and stability. The bead acts as an anchor to hold the tire on the rim.

To make a four-ply tire, the beads are first put in position. Then a bias-cut ply, with its cord angle running in one diagonal direction, is placed on the drum of the assembly machine. A second ply is placed over the first; its cord angle runs in the opposite diagonal direction. These two plies produce equal strength in all directions. The beads are locked into place; the plies are turned up and over the beads and secured. The third and fourth plies are added, and extra strips of fabric are placed around the bead areas to prevent chafing at the rim.

The tread and sidewall unit is then put in position. Rotating wheels under pressure "stitch" and compact the plies and tread, forcing air from between the different layers. After this, the third and fourth plies are turned down and under the beads and stitched in place; the drum is collapsed, and the barrel-shaped cylinder of rubber and fabric is removed.

The tire which is green or uncured, is next subjected to the forming and vulcanizing process. When placed in a curing mold, which looks much like a giant waffle iron, it is a soft, pliable object. In the mold, internal pressure forces a curing bladder into the tire, so that the tire becomes doughnut shaped. Live steam is injected into the bladder and around the mold causing the mold to heat, softening the rubber, and forcing it into the nonskid pattern of the tire mold. In the tightly sealed mold, heat causes a chemical change, vulcanization, which fuses the many parts of the tire into an integral unit. After a prescribed length of time,

which depends on the tire size, the finished tire is removed from the mold.

Forming and curing are separate operations in manufacturing some tires, particularly very large ones for certain trucks and earthmovers. Hydraulic presses force curing bags into the tires to shape them. Then the shaped, but uncured, tires are placed in molds for vulcanization.

In the finishing room the tire is cleaned, polished, and checked on a sensitive balancing machine before shipment to a motor vehicle manufacturer or a retail tire outlet. *See also* RUBBER.

F. B. L.

**TIRESIAS** or **TEIRESIAS** [tairi′siəs], in Greek legend, a renowned soothsayer of Thebes, blind from youth because, as one legend has it, he had seen the goddess Athena bathing. According to another version, he was blinded by Hera for disparaging her sex when, as the only mortal who had lived as both man and woman, he was chosen to decide which experienced the greater pleasure in love. This tale is the theme of an opera by Francis Poulenc and Guillaume Apollinaire and of a ballet by Constant Lambert. Tiresias played a prominent part in Theban legend, uttering prophecies to Oedipus and, in the war of the Seven Against Thebes, to the sons of Oedipus. He retained his prophetic powers after death, and Circe sent Odysseus to consult him in the underworld concerning the return to Ithaca. *See also* SEVEN AGAINST THEBES.

**TIRO, MARCUS TULLIUS.** *See* SHORTHAND.

**TIROL (TYROL)** [tiro′l; tɪ′rəl; tɪro′l], a province of western Austria lying almost wholly within the Alps. It is composed of two disconnected portions, separated as a result of the cession of South Tirol to Italy in 1919. The western and larger part of the province is bounded by Germany (Bavaria) on the north, the province of Salzburg on the east and southeast, Italy (Trentino-Alto Adige) on the south, Switzerland on the southwest, and the province of Vorarlberg on the west. East Tirol, with an area of 780 sq. mi., is bounded by the province of Salzburg on the north, the province of Carinthia on the east, and otherwise by the Italian Tirol. The total area of Austrian Tirol is 4,884 sq. mi.

Many Alpine ranges lie within the province, and among the highest peaks are the Wildspitze (12,382 ft.) and Hochfeiler (11,555 ft.). The Achensee and the Plansee are the largest lakes. The principal rivers are the Inn, which flows from southwest to northeast across the province, the Lech, and the Isel. The Ötzthal, longest lateral valley of the Inn, is broad and fertile in its lower portion.

Dairying is the leading industry, and the tourist business is a major source of income. Lead, iron, lumber, salt, and coal are produced. The main railway line traverses the length of the province from St. Anton am Arlberg on the west to Kitzbühel on the east. The principal cities include Innsbruck, the capital, Landeck, Kufstein, Hall, Schwaz, and Rattenberg. Lienz is the major town of East Tirol.

Tirol was divided between the early Roman provinces of Rhaetia and Noricum. The feudal rulers were the counts of Tirol and the Babenbergs. In 1363 the Hapsburg family inherited the province. The Tirolese have always enjoyed a large degree of autonomy. Of several Tirolese emperors of Austria, perhaps the most distinguished was Maximilian I (1459-1519), who married Mary, daughter of Charles the Bold of Burgundy, thereby adding her inheritance of the Netherlands to Austria's possessions. In the era of the merchant princes, the cities of the Tirol were brisk centers of trade and manufacture. During the wars of the French Revolution the Tirolese, led by Andreas Hőfer, offered spirited resistance to Napoleon and his allies, the Bavarians. Pop. 1951, 427,465.

EWING GALLOWAY

*Cortina d'Ampezzo, an Alpine resort in the Italian Tirol*

**South Tirol.** The Treaty of St. Germain in 1919 gave Italy not only the Italian-speaking district of Trentino, but also a large part of the Tirol, with over 200,000 inhabitants of purely German speech and origin. Between the two World Wars efforts were made to Italianize the population, but many emigrated to Austria. By the peace treaty signed in Paris on Dec. 12, 1946, Italy retained South Tirol but agreed to grant broad powers of autonomy to the German-speaking element.

Italian Tirol, occupying northern Trentino-Alto Adige, an autonomous region, adjoins Switzerland on the west and Austria on the north and northeast. It is more than 5,000 sq. mi. in area and is the most fertile part of the Tirol. Roughly triangular, its southernmost point extends to the northern shore of Lake Garda. The Rhaetian Alps sweep across it, and its principal rivers are the Adige and the Isarco. There are many lakes. The largest towns are Merano, Bolzano, and Trento. In recent years Cortina d'Ampezzo has achieved international fame as a ski center.

**TIRPITZ, ALFRED VON** [tɪ′rpɪts] (1849-1930), German statesman and admiral, was born at Küstrin, in Brandenburg, Mar. 19, 1849. He entered the Prussian navy in 1865 and rose through the ranks to Lord High Admiral of the Imperial Fleet in 1911. In 1897 Tirpitz became Secretary of State and thereafter the builder of German sea power. During the ten years preceding World War I, Tirpitz led an unflagging campaign for a strong navy and by 1914 had made the German navy the second largest in the world. He planned and carried out unrestricted submarine warfare against Great Britain, a policy which was abandoned only after the sinking of the *Lusitania* and the subsequent strained relations between the United States and Germany. Disapproving of Germany's promise to abandon unrestricted submarine warfare, he resigned on Mar. 17, 1916. Tirpitz died at Ebenhausen, Mar. 6, 1930. R. H. L.

**TIRSO DE MOLINA** [ti′rso the moli′nɑ] (c. 1583-1648), Spanish dramatist, whose real name was Fray Gabriel Téllez, was born in Madrid. He was educated at the University of Alcalá and entered the Mercenarian order in 1601. In 1625, possibly because of certain allusions to contemporaries in his plays, the Council of Castile recom-

mended that he be sent to a provincial monastery and forbidden to write further "profane comedies containing bad incentives and examples." In spite of his consequent banishment to Trujillo, in 1632 he was appointed official historian of the order, finally completing a long-projected *Historia general de la orden* in 1639. He died in the monastery at Soria, March 12, 1648.

Like other playwrights of his time, Tirso followed the generic precepts established for the Spanish drama by Lope de Vega, whose methods he defended in his novel *Los Cigarrales de Toledo* (c .1621) ("The River Gardens of Toledo"). Yet in the eighty plays remaining from his original three or four hundred, Tirso displays an original tendency to satire and attack and a superb sense of characterization all his own. Perhaps his best-known plays are *El Burlador de Sevilla* ("The Libertine of Seville"), which first defined the figure of Don Juan Tenorio; *El Condenado por desconfiado* ("The Man Damned for Little Faith"), based on the religious doctrines of the Catholic Reformation; *El Vergonzoso en palacio* ("The Timid Youth at Court"); and *Don Gil de las calzas verdes* ("Sir Gil of the Green Breeches"), which contains one of his characteristic types, an aggressive woman, who in man's disguise goes in search of her faithless lover. Thus, like most of his contemporaries, Tirso's dramatic production ranged from melodramatic intrigue to exposition of religious doctrine, from social comedy to tragicomedy of character, and his subject matter embraced the whole range of knowledge and interest of the time. S. G.

**TIRUNELVELI** or **TINNEVELLY** [tɪ′runɛ′lvɛli; tɪnavɛ′li], a large town of extreme southern India, in the state of Madras, located near the left bank of the Tambravurni River about 70 mi. south of Madurai. Four miles from Tirunelveli, across the river, is the town of Palamcottan, which is noted as the site of the early missionary work of St. Francis Xavier during the sixteenth century. Tirunelveli District, of which the town is the administrative center, has the highest percentage of followers of the Christian faith of any district of southern India, and Palamcottan is an important mission headquarters. The most renowned building in Tirunelveli is the Hindu Temple of Siva, an excellent example of Dravidian architecture. The relatively poor agricultural region, for which Tirunelveli serves as a processing and distribution center, specializes in cotton, millet, oil seeds, and low-grade sugar cane. There is also trade in timber from Shencottah (Travancore). Pop. 1951, 73,476.

**TIRYNS** [tɪ′rɪnz], a prehistoric fortified city in the northeastern Peloponnesos in Greece, about a mile from the coast at the head of the Gulf of Argolis, and about halfway between Argos and Návplion. It stands on a low rocky hill in the plain, but the hill when first inhabited may have been a peninsula or even an island. It is primarily interesting for its tremendous fortifications and its well-preserved palace remains, both of Mycenaean times.

The remains indicate that the site was inhabited before 3000 B.C., and flourished in the Early Helladic Period (third millennium B.C.). The next period of great prosperity reflected in the ruins is the Mycenaean Age (Late Helladic III, fourteenth-twelfth centuries B.C.). The city was populated to some extent from that period until well into Classical times, sending soldiers to the allied army opposing Persia at Plataea in 479; it was substantially destroyed by Argos in 458 B.C. In Roman times it was a deserted ruin.

The site was first excavated by Heinrich Schliemann and Wilhelm Dörpfeld in 1886. Subsequently it was investigated for the German Archaeological Institute by Dörpfeld and Georg Karo in 1905, and by Karo and others later, particularly in 1926-1929. These researches have provided information on two notable building complexes, one Early Helladic and the other Mycenaean.

Of the Early Helladic period, apart from oval, apsidal, and rectangular houses, Dörpfeld and Karo found the foundations of an enormous circular structure on the top of the hill. It was some 93 feet in diameter, built of mud brick on foundations of stone arranged in two concentric circles, buttressed outside by piers. Tiles found among the debris indicate that the structure was roofed, but the method of supporting the great span of the roof has not been established. In any case, the building is the period's most monumental structure of which remains are known.

The chief interest of the site centers on the Mycenaean remains. There are ruins of houses outside the walls, but the most important remains are those of the fortifications and the palace. The central parts of the fortifications were first built in the fifteenth century B.C., and rebuilt in the fourteenth; in the thirteenth century a reconstruction and expansion gave them their present form. They enclose an area some 1,000 feet long and 300 wide, divided into two main parts: the upper citadel with the palace, and the lower citadel on the northern extension of the hill, providing protection for people and flocks in time of siege. A small terrace between is called the middle citadel.

The walls are famous for their impressive dimensions. In places they are still 26 feet thick and 25 high; elsewhere they reached 57 feet in thickness and an unknown height. They are built of enormous blocks of stone, originally set in mud mortar. The main entrance is elaborately contrived along the east side. A ramp clinging below the wall ascends to an outer gate which gives access to a passage lined on each side by walls, leading to the lower citadel on the right and the upper on the left. The latter passage is blocked by a massive gate beyond which the passage continues to an entrance court, on one side of which was a colonnade. On the west side of the upper citadel is a postern made up of a narrow flight of steps curving through the thickness of the wall. Other posterns more plainly devised pierce the walls of the lower citadel. Beside the entrance court on the east the wall attains unusual thickness, and contains within itself a corridor and a series of seven chambers, one of which was a cistern, the others being for dry storage. A similar corridor and row of five storage chambers are built into the south bastion, approached from the palace yard by narrow steps. The west wall of the upper citadel also contains storage chambers.

The palace is better preserved in ground plan than any other princely mansion of its period on the mainland. It consists of a collection of megara (rectangular halls with porches), most of them with their own courtyards and miscellaneous rooms, courts, and corridors. From the entrance court a monumental gate gives access to the palace yard. The gate has the "H" plan with columns between the ends of the walls on each front, which is characteristic of Hellenic architecture. A smaller gate joins the yard to the colonnaded court of the chief megaron. This megaron consisted of a porch with two columns, a vestibule, and a main hall with a hearth and a roof supported by four columns. West of the megaron was a complex of small rooms and corridors, including a bath, the floor of which consisted of a single slab of stone cut to provide drainage for the water. A corridor led behind the megaron to another smaller and simpler megaron facing on a small court; this secluded unit may

have been the private, as opposed to the state, residence of the lord. North of this were other rooms, some resembling megara, in a complex array. A passage led from this section directly to the large gate leading to the entrance court. Fragments of fresco show that the palace was decorated in a modified version of Minoan style.

The terrace behind the palace, known as the middle citadel, may have contained independent dwellings or garden areas. It was separated from the lower citadel by a massive wall comparable to the outer fortifications. R. L. S.

**TISCHENDORF, LOBEGOTT FRIEDRICH KONSTANTIN VON** [tɪ'shəndɔrf] (1815-1874), German textual critic of the New Testament, was born at Lengenfield, Saxony, Jan. 18, 1815. He was professor at Leipzig from 1845 until his death. Von Tischendorf was an assiduous searcher for manuscripts of the Bible in the libraries and monasteries of Europe and the Near East, and in 1843 obtained at the Convent of St. Catherine on Mt. Sinai one of the two oldest vellum codices of the Greek Bible. This manuscript, consisting of 43 leaves, dated from the fourth Christian century and was named the Codex Sinaiticus. It is now in the British Museum. In 1859 on a second trip to the East he obtained the rest of the manuscript, which was presented to the tsar. Von Tischendorf edited many Greek and Latin manuscripts of the Bible and published twenty editions of the Greek New Testament, the most famous of which is the *Octava critica maior* (1869-1872). He died in Leipzig on Dec. 7, 1874. B. M. M.

**TISDALE,** a town in Saskatchewan, Canada, 125 mi. northeast of Saskatoon, located in a farming region. Tisdale was named after Frederick W. Tisdale, who was a Canadian Pacific Railway station agent when the townsite was founded. It has grain elevators. Pop. 1951, 2,141. L. G. R.

**TISSUE,** in biology, a group of cells and their intercellular substances which are united in the performance of a particular function. The body is a co-ordinated composite of five types of tissues: (1) epithelia; (2) connective tissue; (3) muscular tissue; (4) nervous tissue; and (5) blood and lymph.

An epithelium is a cell-rich, avascular tissue which lines a surface. Epithelia may consist of a single layer (simple), such as lines the blood vessels and peritoneum, or they may be many layered (stratified), as in the skin and mouth cavity. Epithelia have many diversified functions and modifications. Paramount among these is the formation of glands: all glands are formed principally by epithelia or epithelioid tissue.

Connective tissues are characterized by few cells and an abundance of intercellular substances. This group of tissues is the largest in the body: its primary function is the support of other tissues. Areolar tissue, tendons, ligaments, aponeuroses, cartilage, and bones are examples of connective tissues.

Muscular tissue consists essentially of cells whose property of contractility has become predominant. Three types of muscular tissue are found in the body; skeletal muscles (voluntary), cardiac (involuntary), and smooth (involuntary).

Nervous tissue is composed of nerve cells and their fibers and supporting cells. The predominant function of this tissue is to carry impulses (irritability and conductivity).

Blood and lymph comprise a group of tissues composed of cells and fluid intercellular substance. The cellular elements of vascular tissues comprise the red and white blood corpuscles, and the interstitial substance, the plasma. W. Mo.

**TISZA, COUNT ISTVÁN** [tɪ'sɒ] (1861-1918), Hungarian statesman, was born at Budapest, Apr. 22, 1861, the youngest son of Kálmán Tisza, who was prime minister of Hungary from 1875 to 1890. Tisza entered parliament in 1866, and until his death was among the most prominent figures in Hungary. Tisza's chief interest was in maintaining the pre-eminence of Hungary in the Dual Monarchy by continuing Magyar national supremacy in Hungary and by supporting the alliance with Germany to weaken the position of Austria. He was prime minister from 1903 to 1905, and again in 1913. He opposed the Austrian policy toward Serbia in July 1914, fearing that a war would destroy the balance in Hungary's favor. After the outbreak of World War I he marshaled all support for its prosecution, but refused to consider reforms, such as the extension of the suffrage, which were demanded on behalf of the non-Magyar nationalities. Tisza's influence over Emperor Francis Joseph was great, but after the latter's death he was dismissed by the young Emperor Charles in May 1917. After commanding a regiment of Hussars at the front, he returned to Budapest in October 1918, seeking to weld all parties together to obtain favorable peace terms. He was assassinated by revolutionary soldiers on Oct. 31, 1918. H. M. M.

**TISZA** [tɪ'sɒ], one of the important tributaries of the Danube River, about 800 mi. long. It rises in the Carpathian Mountains in the western Ukraine and, after crossing and recrossing the boundaries between the Ukraine and Romania and Hungary as it flows in a generally westerly direction, it turns southward across the great plain of Hungary and northeast Yugoslavia until, as the Tisa, it joins the Danube about 30 mi. above Belgrade. Notable tributaries are the Szamos and the Maros (Mureşul). The only important city on the river is Szeged, the second largest in Hungary. In spite of river-regularization works, large areas along the Tisza are still liable to floods. The middle valley is one of the richest wheat-growing areas of Hungary. N. Cas.

**TITANIC,** an English ocean liner lost in an extraordinary marine catastrophe. Just before midnight on Apr. 14, 1912, the White Star liner *Titanic* on its maiden voyage from Southampton to New York, while still almost 1,300 mi. from its destination, struck an iceberg and sank, leaving 1,490 dead. Casualties were particularly heavy among the crew, only 24 per cent surviving. None of the ship's band or of the engine crew was saved. Of the 534 women and children aboard 70 per cent survived; of the 1,667 men only 20 per cent. Among those lost were the ship's captain; the president of the Grand Trunk Railway, Charles H. Hayes; the vice-president of the Pennsylvania Railroad, J. B. Thayer, Jr.; John Jacob Astor, Jr.; Benjamin Guggenheim; George D. Widener; and Isador Straus, whose wife refused rescue.

When the tragedy occurred the sea was unusually calm and the night was clear and cold. Although the captain had received warning of icebergs ahead he had decided to follow the prevailing practice of relying on a sharp lookout rather than reducing speed. For this he was severely criticized by a London court of enquiry headed by Lord Mersey. Also castigated was the captain of the Leyland liner *Californian* for refusing prompt aid to the stricken vessel although his ship was less than ten miles away when distress signals were reported. This most tragic of ship disasters to the largest vessel then afloat (46,328 tons gross), occurring on the ocean's most heavily travelled route, brought investigations on both sides of the Atlantic and resulted in the tightening of the marine laws of the United States and England in matters relating to equipment and practices for the promotion of safety at sea. W. M. W.

**TITANIUM** [taite′niəm], symbol Ti, atomic number 22, at. wt. 47.90, density 4.5, m.p. 1,800° C., b.p. over 3,000° C. Titanium, named after the Titans of Greek mythology, is the first member of Group IV-A of the periodic table, followed by zirconium and hafnium. The members of the A and B families of Group IV resemble one another more closely than those in any other group; and titanium closely resembles silicon and zirconium. Titanium is a transition element, having an atom which contains two completed shells of electrons (2, 8), a third incomplete shell of 10, and a fourth or valence shell of 2. Titanium behaves as a metal, losing its two outermost electrons and forming compounds in which it is bivalent ($Ti^{++}$), but these are unimportant. Trivalent ($Ti^{+++}$) and quadrivalent compounds ($Ti^{++++}$) are more important, but the most characteristic compounds are the titanates in which titanium serves as a nonmetal, giving $TiO_3^{--}$ ions.

**Occurrence.** Titanium is the ninth element in abundance, making up more than 0.6 per cent of the crust of the earth. It is several times as abundant as many of the elements which are much better known and much more important. The chemistry of titanium has developed slowly, and it is still regarded as a rare element because so little is known about it and its compounds. It is found as rutile, $TiO_2$ (analogous to $CO_2$ $SiO_2$, $ZrO_2$), in titanates such as ilmenite, $FeTiO_3$ (like $FeCO_3$), and in varying amounts in silicates, tantalates, and many other mineral products; it is almost always present, at least in traces, in sand, clay, soil, mineral waters, and plant and animal tissue.

**Uses.** Titanium is obtained as a dark-gray paramagnetic powder or as a fused compact metal resembling polished steel. It is usually brittle, but when pure and properly treated it is strong and ductile and capable of being forged, drawn, and fabricated. It is stable in the air, but when heated to 610° C. it takes fire and burns with dazzling brilliancy. It alloys readily with other metals. The most important alloy is ferrotitanium, very useful in the steel industry both as a deoxidizer and in making alloy steels. It contributes to the production of hard steel, and aids in increasing resistance to shock and corrosion. Titanium also alloys with copper and the bronzes, a notable development being the construction of the combustion chamber of jet aircraft engines by use of an alloy of nickel, chromium, and titanium.

**Principal Compounds.** Titanium compounds in commerce are not numerous. The trichloride, $TiCl_3$ forms unstable violet crystals, useful in solution as a reducing agent in analytical chemistry and for removing stains in the laundry. The tetrachloride, $TiCl_4$, a colorless liquid, forms dense white fumes in moist air; it is used in manufacturing iridescent glass and artificial pearls. With ammonia it is used in skywriting. Titanium dioxide, $TiO_2$, is manufactured from ilmenite. It is a white powder, insoluble and infusible, becoming dark when heated. It is widely used in the manufacture of enamels, glazes, linoleum, rayon, plastics, white rubber, paper, leather, shoe creams, and face powders. Its most important use is in paints, both as straight $TiO_2$ and as composite pigments. Its advantages are high covering-power, lightness, permanence, nonpoisonous nature, and ease of mixing with oil. B. S. H.

**TITANS** [tai′tənz], in Greek mythology, the children of Uranus (Heaven) and Gaea (Earth). They were twelve in number, six sons (Oceanus, Coeus, Creus, Hyperion, Iapetus, and Cronus) and six daughters (Theia, Rhea, Themis, Mnemosyne, Phoebe, and Tethys). The more important of these were Hyperion and Theia, the parents of Helios, Selene, and Eos; Oceanus and Tethys, the parents of river gods and ocean nymphs; and particularly Cronus and Rhea, the parents of Hestia, Demeter, Hera, Pluto, Poseidon, and Zeus. The Cyclopes and the Hecatonchires were also the offspring of Uranus and Gaea. When these were imprisoned in Tartarus by Uranus, Gaea appealed to the Titans; Cronus mutilated Uranus with a sickle, and from the latter's blood came the Furies and the Giants. In the war with the Olympian gods, all the Titans except Oceanus supported Cronus, but they were defeated and consigned to Tartarus. The Titans were ancient figures, belonging to a past already remote to the early Greeks, and several of the names seem to be of foreign origin. As a group, the Titans have been explained as personifications of earthquakes and volcanic eruptions or as representations of the wild forces of Nature; they are overcome by the Olympian deities who stand for peace and order. The name "Titan" was given also to sons of the original Titans, such as Atlas, Prometheus, and Hēlios. *See also* CRONUS; URANUS. G. E. D.

**TITCHENER, EDWARD BRADFORD** (1867-1927), American psychologist, was born at Chichester, England, Jan. 11, 1867. He was educated at Brasenose College, Oxford. Studying further under Prof. Wilhelm Wundt at Leipzig, he received his Ph.D. in 1892. Titchener devoted his life to the development of experimental psychology from the point of view of structuralism. From the systematic point of view, he was a follower of Wundt, although he went far beyond Wundt in his insistence on pure psychology and the analysis of immediate experience by means of introspective analysis into elements and attributes. In 1904 Titchener began a series of spring meetings for invited psychologists which continued until his death in 1927. This informal group constituted the nucelus of the famous Society of Experimental Psychologists which was organized in 1928. He died in Ithaca, N. Y., Aug. 3, 1927. A. W. S.

**TITHE** [tai′th] (O.E. *teotha,* a tenth), generally defined as the tenth part of fruits and profits justly acquired, owed to God in recognition of his supreme dominion, and paid to the ministers of religion. It is an institution of undetermined antiquity, common to the Israelitic and many pagan religions. Adopted in principle by the Christian Church from apostolic times, and subjected eventually to formal legislation (Synods of Tours, 567, and Macon, 585), the institution was later enforced by the civil authority (late eighth century Capitularies of Charlemagne), recognized in pre-Norman England and sanctioned by English statute law (Westminster, 1285). It has continued in modern times in the cases of the established Church of England and the Roman Catholic Church—notably in Austria and Hungary—but elsewhere it has been generally replaced, with changed political and social conditions, by other systems of voluntary support of the clergy. N. J. T.

**TITHONUS** [tɪtho′nəs], in Greek mythology, son of Laomedon of Troy and brother of Priam. He was beloved by Eos, goddess of the dawn, and became by her the father of Memnon. She procured for him from the gods the gift of immortality but forgot to ask for eternal youth; as a result, Tithonus became a shriveled old man and eventually turned into a grasshopper. G. E. D.

**TITI** [titi′], any one of several species of small, squirrel-like monkeys, *Callicebus,* related to the saimiris. Titis inhabit Brazil and the Amazon basin. They have small eyes and a

small head which is depressed and not elongated. The fur is thick, consisting of long, fine, wavy hairs, beautiful in texture with well blended, modest colors. The tail, usually longer than the body, is covered with bushy hair. The nails are relatively long and compressed. Titis are diurnal. In captivity they are retiring and inactive. R. T. H.

**TITIAN (TIZIANO VECELLI)** [tɪ′shən, titsyɑ′no vetshɛ′lli] (c. 1477-1576), Italian painter, was born in Pieve di Cadore (Veneto) sometime between 1477 and 1488. His first recorded work, frescoes, now indistinct, on the façade of the Fondaco dei Tedeschi, Venice, were done (1508) in such close association with Giorgione, then the most gifted and original painter in Venice, that the nature of Titian's early style has always been a subject of controversy. His frescoes illustrating the *Miracles of St. Anthony* (Scuola del Santo, Padua), done the year after Giorgione's death, 1511, being also considerably damaged by time, do not completely resolve the enigma, despite their evident novelty of invention and mastery of light and form. The first well-preserved work of Titian's, which is also dated indisputably, is the large altarpiece of the *Assumption of the Virgin* (1516-1518, Frari, Venice), which is obviously the mature production of a great artist. A few preserved drawings (Louvre, Paris; British Museum, Victoria and Albert Museum, London) betray the careful study that preceded the painting, but the light quill lines and the blunt chalk strokes served Titian only as a means of visualizing his concepts, rather than as a chart from which he was to work in the usual Italian manner. From the first, he saw the picture in terms of paint; and, as he worked, the different densities of pigment, which an oil medium permits, were deftly and sensitively exploited to create a glowing pattern of colored textures and to evoke a vision of beautiful human forms, not so much revealed by light, as moving in a world of softened lights and transparent shadows. This became the theme of Titian's art, whether he was showing a Venetian family introduced to the Virgin by its patron saints in a lofty loggia (*Pesaro Madonna,* 1519-1526, Frari) or showing a meadow full of sportive loves at the base of a statue of Venus (*Worship of Venus,* Prado, Madrid). Throughout his long, active life, he continued to develop his power of expression through light, shadow, and color, passing, from decade to decade, through the exquisitely balanced textures and golden light of the *Venus of Urbino* (1537, Uffizi, Florence), the rich, dark warmth of the *Portrait of Paul III* (1543, Naples), the opalescent transparencies of the *Europa* (1561, Gardner Museum, Boston) to the grey dissolving shapes of the *Pietà* (1576, Academy, Venice). His emotional power equalled his technical skill. He was capable of understanding and presenting the human tenderness of a *Holy Family* (Florence, London, Madrid, Venice, etc.), the tragedy of an *Entombment* (1559, Louvre; Prado), or the mystic fervor of the *Trinity* (1553, Prado) which satisfied the religious fanaticism of the Emperor Charles V; but his genius was best liberated when he was treating a fresh, lyrical theme drawn from ancient literature (*Sacred and Profane Love,* Borghese Gallery, Rome; *Venus Anadyomene,* 1523, Bridgewater House, London; *Bacchus and Ariadne,* 1523, National Gallery, London; *Danaë,* 1546, Naples), or in the portrayal of the personal quality and natural human dignity of a distinguished man or a beautiful woman (*Tommaso Mosti,* c. 1524, Uffizi; *Isabella of Portugal,* c. 1545, Prado). His enormous success as a portraitist, which brought him commissions from dukes, kings, and princes of the Church, was certainly due to the fact that he was able to paint each individual sitter's ideal of himself. The portraits are clearly always likenesses (*Cristoforo Madruzzo,* 1542; *Jacpop Strada,* 1566, Vienna) and equally clearly give us Titian's estimate of the character of the personage represented (*Young Englishman,* Pitti, Florence; *Cardinal Granvella,* 1548, Kansas City, Mo.) but the subject's physique and his character are always ennobled by Titian's recognition of his ideal potentialities and by the beauty of Titian's art.

Titian's success brought him considerable wealth. He was a host both to such intimates as Pietro Aretino, as well as to distinguished state visitors, including Henry III of France. With the exception of the year 1548, spent at the imperial court at Augsburg, where he painted many portraits of celebrities, and another year, 1545-1546, spent at the papal court of Paul III in Rome, Titian resolutely refused all offers, however lucrative, to leave the relative freedom of Venice. But he was not thereby parochial in his outlook on contemporary art and culture. In brief visits to near-by Mantua and Urbino, he saw paintings by Raphael and Correggio; casts, engravings, and drawings made him familiar with the sculpture and painting of Michelangelo even before he visited Rome and Florence. Collections of antiquities, like that of Cardinal Grimani, came under his eye at Venice, giving him an ac-

*SACRED AND PROFANE LOVE*

quaintance with that idealization of the human form so inspiring to the artists of the Italian Renaissance. Usually Titian's indebtedness to the antique or to his great contemporaries is so transmuted by his pictorial handling of a borrowed motif that it almost eludes detection, but occasionally, as in the astonishing foreshortening of the *Sacrifice of Isaac* or the *David and Goliath* (1543, San Spirito, Venice), he seems to challenge comparison, lest his preference for a more fluent and natural mode of expression be misconstrued as an incapacity to work in "the grand manner." Titian set the tone for the next two centuries of Venetian painting, and he so enlarged the aesthetic potentialities of the art of painting that he is the spiritual father of later schools as well. He died in Venice on Aug. 27, 1576. R. W. K.

**TITICACA** [titikɑ'kɑ], a lake, the highest navigable body of water in the world, on the Andean Altiplano at an elevation of 12,644 ft. in eastern South America. Its dimensions, a length of about 95 mi. and a width of 35 mi., give it the distinction of being the largest lake on that continent. It is divided into two sections by the peninsulas of Copacabana on the west, and Huata or Achacachi on the east. The narrow strait of Tiquina connects the northern part, Chucuito, and the southern part, Winaymarca. The Peruvian-Bolivian boundary transverses the northern section from southwest to northeast. The northern lake, many parts of which are over 600 ft. deep, contains fresh water; the southern lake is shallower and slightly brackish. The average temperature of the lake water is 51° F. The Rio Desaguadero drains southward from the lake. To the north of the peninsula of Copacabana lie the famous islands of Titicaca and Coati, known respectively as the islands of the sun and the moon. Many ruins of the Inca and pre-Inca Tiahuanaco civilization have been found on both islands. South of the peninsulas are many small islands. On the east side of the lake, in Bolivian territory, are the towns of Achacachi and Puerto Acosta. Steamers between Guaqui in Bolivia and Puno in Peru connect at these towns with trains to and from La Paz, Bolivia, and Mollendo, Peru. Natives with boats of reeds or lumber imported from the forest of northeastern Bolivia carry on a fishing industry, selling their surplus catches in La Paz. P. E. J.

*Native craft on Lake Titicaca*

RICHARD B. HOIT FROM CUSHING

**TITLARK,** any of small larklike birds of the family Motacillidae inhabiting all parts of the world. The American titlark, *Anthus rubescens,* is very generally distributed over North America breeding in the Rocky Mountain states northward to Alaska and wintering in the Gulf states, Mexico, and Central America. It is 6½ in. long, the upper parts olive-brown, the under parts pinkish-buff streaked with brown. It confines itself to open country, showing a marked preference for wet fields and bogs. Its food consists of worms, insects, and seeds of various kinds. The grayish speckled eggs, four to six, are laid in a grass nest on the ground. C. R. Eb.

**TITMOUSE,** any one of numerous species of small to very small (4-7 in.) songbirds of the family Paridae. They are allied to the nuthatches and in some ways, despite their very different appearance, even more closely to the crows and jays. They are widely distributed in temperate and tropical regions of both the Old and New Worlds, excepting South America. The most typical titmice, exemplified by the chickadee, have the crown and throat black, the remaining upper parts gray, blue, or olive green, the remaining under parts yellow or white, but there are many variations on this pattern; some species are conspicuously crested. They are frequent dooryard visitors not easily frightened by man. H. G. De.

**TITO.** *See* Broz, Josip.

**TITRATION.** *See* Analytical Chemistry.

**TITUS (TITUS FLAVIUS SABINUS VESPASIANUS)** [tai'təs] (c. A.D. 40-81), Roman emperor, son of Vespasian, was born in Rome, Dec. 30, 40 or 41. He served in Germany and Britain and commanded a Roman legion in Vespasian's campaign against the Jews, directing the campaign in Judea in 69; he took Jerusalem, Sept. 8, 70, after a long siege, and on his return to Rome he was rewarded with the title of Caesar and was given a part in the government. Soon afterward he and his father celebrated triumphs recorded by the Arch of Titus. Titus was not popular at first, partly because of his relations with Berenice, sister of Herod Agrippa, who came and lived in his palace, but on succeeding his father as emperor (A.D. 79) he established a record as a humane and progressive ruler and became the idol of the Roman people. He ended prosecutions for treason and became *pontifex maximus* to avoid shedding blood. He completed the Colosseum begun by his father and built new public baths and other institutions for the public benefit. He also visited Pompeii when it was destroyed but returned to Rome to assist those made homeless by a three-day fire. There was little war during his brief reign, the only fighting being in Britain. Titus died at Reate, Sept. 13, 81. T. R. H.

**TITUSVILLE,** a city in Crawford Co., in northwestern Pennsylvania, situated on the north bank of Oil Creek, 15 mi. north of Oil City. It is an industrial community in a natural gas and oil district. Titusville was settled in 1796 by Samuel Kerr and Jonathan Titus and named for the latter. It became a borough in 1847 and received its first city charter in 1866. Another charter was granted in 1889 and the commission form of government in operation in 1950 was adopted in 1914. Under the direction of Col. Edwin L. Drake in 1859, the first artesian oil well drilled in the United States struck oil, thus starting the Pennsylvania oil industry. In 1872 nat-

ural gas was discovered, and the pioneer development of the Pennsylvania gas fields began at Titusville. The museum in Drake Well Memorial Park contains parts of the original well equipment. The New York Central and the Pennsylvania railroads and American Airlines planes supply transportation. In addition to the production and refining of petroleum and the manufacture of its by-products, other industries produce oil-well supplies, steel products, gas and steam engines, cutlery, and explosives. Agricultural products of the area include milk, buckwheat, and potatoes. Po. 1950, 8,923.

**TITYUS** [tɪ′tiəs], in Greek mythology, a giant, the son of Gaea. Having attempted to assault Leto, he was slain by the arrows of Apollo and Artemis, or by a thunderbolt of Zeus, and cast into Tartarus. There he lay outstretched on the ground, with two vultures forever devouring his liver, which grew again as rapidly as it was consumed.
G. E. D.

**TIVOLI** [ti′voli], a town of the region of Latium, in central Italy, about 20 mi. east-northeast of Rome. It is an episcopal see, noted as the site of the Renaissance palace, the Villa d'Este. The town has light industries, and a hydroelectric plant is nearby. Tivoli was badly damaged by bombs during World War II. Pop. 1936, 16,886.

In ancient times the town was known as Tibur. It is situated at a point where the Anio River, seeking an outlet toward the volcanic plain, has worn a deep gorge into which it falls in impressive cascades. The river valley forms an important route connecting the Latin plain, and particularly Rome, with the interior of the peninsula and with the Adriatic coast; it was for this reason that Tibur, which controlled this route, the Via Valeria, and gave the name Via Tiburtina to its first stretch, attained its prominence. The original site of the town was determined by the erosion which had almost isolated a portion of the limestone rock, making a natural stronghold which dominated the Anio gorge.

In early times Tibur was a member of the Latin League, hostile to Rome; later (at the end of the fourth century B.C.) it became an ally. Early remains, mostly from the era of the Roman Republic, include portions of the city walls, two temples—one rectangular and one round—overlooking the inner gorge, and a deposit of clay ex-votos, testifying to the existence of a primitive sanctuary on the slopes of the outer gorge. There is also a huge rectangular architectural ensemble built upon massive substructures at a point below the town where the hillside slopes toward Rome; with this structure, as numerous inscriptions show, the cult of the local patron hero, Hercules, and eventually that of the Imperial House were associated. The early Imperial Period is represented by several buildings about the forum, and especially the office of weights and measures. The hillsides of the Tiburtine territory overlooking the river, and the gently-sloping declivities in the direction of the plain, attracted the Romans of all periods, who chose them for the sites of their villas. Tibur was particularly noted as a health resort; the ancient warm sulphur baths, 5 mi. west of the town, are the modern Acque Albule. Many eminent persons possessed country and suburban estates near Tibur; the poets, notably Horace and Catullus, knew and loved the region. Water from the Anio, or from the four great aqueducts which passed here on their way from the upper valley of the river to Rome, could be diverted for the use and amenities of the villas. Between the years 126 and 134 A.D. the Emperor Hadrian, himself a dilettante architect, acquired a pre-existing residence, situated some distance from the town on the lower slopes toward Rome, and, starting with the earlier nucleus, constructed a huge imperial residence, the surviving portions of which rank among the best-preserved and most extensive remains of Roman architecture.
A. W. Van B.

**TLAXCALA** [tlɑskɑ′lɑ], the name of the smallest state of the republic of Mexico and of its capital.

**The City.** Tlaxcala is situated in the central part of Mexico on the Atoyac River, 22 mi. north of the city of Puebla and 71 mi. east of Mexico City. In the sixteenth century, at the time of the Spanish Conquest, it was a place of considerable size and great importance, but it has declined steadily since then. Tlaxcala has little industry, although it is served by the Mexican Railway and is an outlet for the state's agricultural products. Among the most notable of the city's historic buildings is the church of San Francisco, built in 1521, which is claimed to be the oldest on the North American continent. Pop. 1950, 5,071.

**The State.** The state of Tlaxcala is bounded on the northeast, east, south, and southwest by Puebla, on the west by Mexico, and on the northwest by Hidalgo. Although its area of 1,555 sq. mi. is the smallest in the republic, it is one of the most densely settled. There are no large cities, but the state has many small farms which are efficiently cultivated. Tlaxcala forms a part of the central Mexican plateau and has an average altitude of about 7,000 ft. The terrain is hilly and in many places mountainous. In the thirteenth century this was the powerful native state of the Tlaxcalans, a Nahuatlan people who came from the region of Lake Texcoco and successfully opposed the Aztecs. When Hernando Cortés and his Spaniards invaded Mexico, the natives fought against him for a time; after Cortés defeated them, however, they joined with the conquerer to subdue the Aztecs. The state is predominantly agricultural, although it has some iron and silver mines and local handicraft industries. Its textile industry has also become important. Pop. 1950, 284,551.
S. G. I.

**TLEMCEN** [tlɛmsɛ′n], a city in Algeria, and capital of an *arrondissement* in the department of Oran, about 80 mi. southwest of the city of Oran. It is situated near the Moroccan border, on the north slope of the 2,500-ft. Lella Setta hills and at the border of the great depression to the west of the plain of Oujda and Taza Pass. It is an ancient city, rebuilt in the eleventh century by the Zenata dynasty, and was the capital of Maghreb in the Middle Ages. Tlemcen prospered in the fourteenth century under the Merenide dynasty but was taken by the Turks in 1554. It was attacked by the French in 1836 and finally taken by them in 1842. In its vicinity are prosperous cultivations of olives and vineyards. The town has many sites of interest, among which are the ancient ruins of Sidi bu Medin, the mosque of Jamaa el Kebir, built in A.D. 1136, the mosque of Halawi, the museum of antiquities, the Meshuar or citadel, and the Kessaria (the market of European merchants). The city is divided into four sections: the Jewish section in the southwest, the Moorish in the southeast, that of the merchants in the northeast, and the new town in the northwest. Tlemcen is noted for its fine cloth, carpets and shawl industries. In 1936 about two thirds of the population were natives. Pop. 1948, 51,372.
M. B. H.

**TNT.** *See* Explosives.

**TOADFISH,** *Opsanus tau,* a sculpinlike fish with a large flat head and huge mouth in the family Batrachoididae.

The ventral fins are located far forward on the throat in front of the pectoral fins. Glands in the naked skin secrete large quantities of slime. The toadfish lives in shoal water along the east coast of North America from Maine to Cuba. It hides among plants or in dens under stones awaiting its prey which includes a long list of invertebrate animals and small fishes. Toadfish attain a length of 15 in.; the male stands guard over the large, adhesive eggs which measure 5 mm. in diameter. They are laid in a single layer in holes under stones, in old cans, or even in old shoes on the bottom. Even after hatching, the young remain attached to the large yolk sac which still adheres to the bottom. The young break away when slightly over one-half inch in length. The toadfish burrows in mud in offshore areas during the winter. When handled, it makes loud croaking noises by contracting the air bladder. It is of no commercial value and some members of the family are poisonous. E. C. R.

**TOADFLAX,** the name commonly given to a large genus, *Linaria,* of herbaceous plants of the figwort family. Their flowers are showy and many-colored, with long spurs, and are borne in terminal clusters; their leaves are whorled or opposite. A few of these small, smooth herbs are widespread as weeds, while several are grown as garden ornamentals. More than 100 species are found widely grown throughout the north temperate regions. In North America seven species occur; the two most common are butter and eggs, *L. vulgaris,* and the blue toadflax, *L. canadensis.* The former, which bears showy orange- and yellow-colored flowers, has been naturalized from the Old World, while the latter is found across the continent and is recognizable by its delicate blue flowers bearing a threadlike spur. *See also* Butter and Eggs. M. G. W.

**TOADS,** a general term commonly applied to terrestrial, tailless amphibians which have squat bodies, short fore legs, and warty skins. Although the terms toad and frog are often used interchangeably, for many intermediate forms exist, the *Bufonidae* and closely related families are generally considered the true toads. They are found practically the world over, but not in Madagascar nor in some Pacific islands. Many species burrow in the earth and emerge at night to feed on insects. *Bufo americanus,* the common toad of North America, and *Bufo vulgaris,* of Europe, benefit farmers by eating injurious insects. Some toads live in ants' nests, in the tropics, and feed entirely on ants. Some forms have smooth skins and live in water. Most species lay their eggs in water, and the tadpoles become adults in a short time.

Many curious forms exist. The shell-headed toad of Cuba lives in a burrow, for which the horny surface of its head forms a perfect lid. One group, *Nectophrynoides,* of East Africa, is unique among the tailless amphibians, or Salientia, in that it gives birth to live young. Many species secrete an irritating or poisonous substance from their skins. However, contrary to popular belief, warts are not acquired from handling toads. A. Sv.

COURTESY OF THE AMERICAN MUSEUM OF NATURAL HISTORY

*AMERICAN TOAD, BUFO AMERICANUS*

**TOADSTOOL,** a common name given to various species of fungi having an umbrella-shaped cap. In popular usage, the name applies to any poisonous mushroom. The term also includes other fleshy mushrooms, such as the puffballs or morels. *See also* Fungi; Mushroom. J. C. Wis.

**TOASTER, ELECTRIC.** *See* Household Appliances, Electrical.

**TOBA.** *See* Indian Tribes, South American (*Principal Linguistic Families*).

**TOBACCO,** an herbaceous plant and its leaf, a member, *Nicotiana tabacum,* of the nightshade family. An annual, it is grown practically everywhere in the world. Its leaves, when dried or cured, are rolled into cigars, shredded for use in cigarettes and pipes, processed for chewing, or ground into snuff. The plant often reaches 6 ft. in height and is rich and luxuriant in appearance, although coarse and sticky to the touch. The unbranched stem bears leaves that attain a length of 1 to 2 ft. The plant produces pale pink or reddish trumpet-shaped flowers at the top. Tobacco seeds are minute and very numerous; one plant can produce more than 100,000 seeds.

THOMÉ—DR. LASCOFF

*Tobacco plant,* Nicotiana tabacum, *with detail of the flower showing pistil and stamens*

**Cultivation.** Although it is not an easy crop to cultivate, tobacco can be grown successfully in almost every cli-

mate and in many types of soil. However, tobacco tends to be greatly influenced by its environment, and the conditions under which it is grown have a considerable effect on its essential characteristics. The plant is very sensitive to soil, which determines texture, and to climate, affecting aroma. The successful cultivation of tobacco demands considerable knowledge and careful judgment on the part of the farmer, a great amount of hand labor, soils of above-average fertility, and an ample supply of fertilizer. In the principal tobacco-growing areas of the United States, seeds are first distributed in nursery beds (although hothouses or hotbeds are employed on tobacco farms in the North). Cloth is frequently used to protect the seedlings from the weather. When the young plants reach a height of 4 to 6 in., they are transplanted by machinery (except for very small crops) to the field. The field must be well rested, well nourished, particularly by potash, and well drained. Preventive measures must be taken by the farmer to control disease and the many insect pests that attack the plant. As soon as the flowers begin to bud, they are cut off, unless seeds are desired. Tobacco plants of the cigar-leaf variety are an exception, however, and are not pruned.

**Processing.** Tobacco crops are harvested four to six months after the original planting, at about the time when the leaves start to turn yellow; the most popular method of harvesting is to cut each leaf individually as it ripens, although in some instances the entire plant is cut at once. The leaves are then strung together for curing. Tobacco may be air-cured, flue-cured, or fire-cured. In the first process, the tobacco is either exposed to the sun or placed in open, ventilated barns and allowed to mature naturally. Tobacco that is to be flue-cured is hung in specially prepared, airtight barns which are heated by large pipes, or flues, that carry the warmth of exterior fires through the interior of the barn. This is a much more rapid process than the natural, air-curing method; most American tobacco is flue-cured. A third system is fire-curing. The tobacco is hung in barns that are airtight, and the smoke and heat rising from open fires on the floor of the barns cures the tobacco.

After curing, the leaves are subjected to moisture to prevent cracking or breaking, and are then sorted into the various standard grades based on size, color, quality, and similar criteria. The sorted tobacco is placed in cases, bales, or hogsheads and usually shipped to a central tobacco warehouse where it is eventually sold directly or auctioned to the highest bidder. Occasionally, tobacco sales take place on the tobacco farm itself. Marketed tobacco is repacked and allowed to age for a year or two before being manufactured into commercial forms.

**Manufacturing.** Although each variety and grade of tobacco is generally applicable to a particular use, manufacturers blend the various sorts of tobacco to obtain consistant, uniform types. In the United States, most tobacco goes into the manufacture of cigarettes, although considerable quantities are used in cigar-making. The manufacture of chewing tobacco and snuff is comparatively small. The tremendous growth in the popularity of cigarettes in the United States after World War I caused a corresponding decline in the production of cigars and other tobacco products, but the over-all consumption of tobacco increased.

The four greatest tobacco-growing countries are the United States, India, China, and the Soviet Union. However, in the latter three countries the bulk of the tobacco produced is consumed locally. Countries such as Cuba, Greece, and Turkey, which grow comparatively small amounts of tobacco, have much more important crops, since the tobacco grown in such places is in great demand throughout the world for use in cigars and cigarettes. The United States grows, manufactures, and consumes more tobacco than any other country in the world.

EWING GALLOWAY

*Burley tobacco in piles in the vast auction room of a Lexington, Kentucky, warehouse*

**Use.** The custom of smoking tobacco originated with the Indians of the Western Hemisphere, probably as early as A.D. 100. Tobacco was used at first principally in connection with religious rituals, but by the end of the fifteenth century tobacco smoking, although still retaining ceremonial characteristics, had become a common personal practice throughout most of the hemisphere. Europeans first learned of tobacco smoking when it was observed in Cuba by members of Columbus' crew in November 1492. Besides smoking tobacco, the Carib Indians also used finely powdered tobacco leaves as snuff; they inhaled the snuff through a hollow Y-shaped piece of cane by applying the forked ends to the nostrils and placing the other end close to the powdered tobacco. This instrument the natives called a "tobago" or "tobaca," which name, slightly altered, the Spaniards later applied to the tobacco plant and to its cured leaves.

The first substantial commercial cultivation of tobacco by Europeans was undertaken by the Spaniards, who laid out tobacco plantations in the West Indies in 1535 and shortly afterward grew it also in Spain. Tobacco first became popular in Europe chiefly for its supposed curative powers. It was frequently used in the form of poultices and sometimes taken as snuff. The use of snuff became the fashion in the court of Catherine de Médicis, Queen of France, who had tried it as a remedy about 1561 at the suggestion of her ambassador to Portugal. It was in honor of the ambassador Jean Nicot that the tobacco plant was later given the botanical name "Nicotiana." The Spaniards had a virtual monopoly of the European markets until 1575, when the Portuguese began to grow large quantities of tobacco. Later, Dutch colonists in the East Indies and English settlers in Virginia entered the competition for the European tobacco trade, and so rapid was the spread of tobacco smoking that by the early seventeenth century its use was almost world-wide. For a variety of reasons, however, tobacco was often looked upon with great disfavor by the rulers of the lands to which it was brought. Throughout the world royal prohibitions forbade the use of tobacco and threatened punishments that ranged up to the death penalty for a third offense. The last noteworthy royal edict against tobacco was published in Abyssinia near the end of the nineteenth century. Bans on smoking are

still enforced by certain religions, while several others, which do not actually condemn the practice, look upon it with disapproval. Such strictures against smoking have had little lasting effect, however; tobacco has continued to increase in popularity and is now grown and used in almost every section of the world. *See also* INDUSTRIES, EXTRACTIVE.

R. L. F.

**TOBACCO BEETLE,** the common name of a very small, brown beetle, *Lasioderma serricorne,* belonging to the family Anobiidae. It feeds upon dried tobacco, spices, seeds, dried fruits, cereal products, and other materials, and is a serious pest in most parts of the world. The eggs are often laid in tobacco. These hatch after the tobacco has been processed and the larvae bore holes through the finished cigarette.

C. H. Cu.

**TOBACCO WORM,** the common name of the larva of *Protoparce sexta,* a gray sphinx moth, marked with lines of white and black, and, usually, with six orange spots on the sides of the abdomen. It is a serious pest of tobacco. Arsenical sprays have long been used in its control. When undisturbed, it may destroy whole stands of tobacco. C. H. Cu.

**TOBAGO** [tobe′go], an island of the Lesser Antilles, in the West Indies, situated 21 mi. northeast of the British colony of Trinidad, of which it is a part. Its area is 116 sq. mi. and consists largely of a volcanic mountain. The area under cultivation is small, but the land is fertile. Coconuts, sugar, cotton, nutmeg, coffee, and tobacco are grown. There are large reserves of hardwood timber, some of which, along with lime, cacao, and coconuts, are exported. Deer and game birds are in abundance, and snapper, kingfish, grouper, and Spanish mackerel are native to the surrounding waters. The climate during the dry season is pleasant, but is oppressive throughout the wet season from June to December. The average mean temperature is 80° F., and rainfall on the windward side of the island is greater than on the leeward side. Scarborough, once called Port Louis, is the capital and chief town.

Tobago was discovered by Columbus in 1498, and was settled by the Dutch in 1632. Until 1814, when it was ceded to the British Crown, the island belonged, in turn, to the Dutch, British, and French. In 1877 it was made a crown colony, and in 1889 was annexed to Trinidad as a joint colony. By an Order in Council of Oct. 20, 1898, the island became a ward of the United Colony of Trinidad and Tobago. The white population is descended from the Portuguese, French, and British, but the majority is Negro. Pop. 1946, 27,161. S. C. M.

**TOBATA** [tobɑtɑ], an industrial and port city of southwestern Japan. It is on the northwestern coast of Kyushu Island near the western entrance to Shimonoseki Strait, about 10 mi. southwest of Moji. Tobata is a comparatively new city and developed with the industrialization of Japan. It lies within the Shimonoseki-Moji-Yawata heavy industry district and has steel mills, machine shops, oil refineries, glass and cement factories, flour mills, and sugar refineries. The city suffered heavy damage in World War II air attacks in the spring and summer of 1945. Pop. 1950, 87,885.

J. E. F.

**TOBIT, BOOK OF** [to′bɪt], a book of the Apocrypha. It is extant in Greek and in a number of other ancient versions, including Syriac, Latin, and Aramaic. Whether the book was written originally in Greek or in a Semitic language remains a controversial point. Its date of composition is also not certainly known, but it is generally supposed by Biblical scholars that it appeared in its earliest form some time between the third and the first century B.C.

Tobit, the central character of the work, is a righteous man from the tribe of Ephraim who was brought captive to Nineveh by the Assyrians. He prospers in Nineveh and engages in good works, particularly in the burial of the dead, but one night he is stricken blind and prays in his misery for death. At the same time Sarah, a widowed kinswoman of his in Ecbatana, also prays for death, and in answer to these prayers the archangel Raphael is sent to earth. Through Raphael's agency a happy marriage is effected between Sarah and Tobit's son Tobias, and Tobit is cured of his blindness. D. G.

**TOBOLSK** [tʌbɔ′lysk], a commercial town in the Omsk Region of the Russian Soviet Federal Socialist Republic, in the central Soviet Union, about 295 mi. northwest of Omsk. It lies on the high right bank of the Irtysh River opposite the mouth of the Tobol River in the great Siberian lowland. Founded in 1587 by Cossacks on the site of a Tatar village, it was one of Russian Siberia's first towns and became its first diocese. For many years it was an important trading center for furs and fish. Its severe climate and the construction of the Trans-Siberian Railway far to the south led to the town's decline. Economic and administrative functions shifted to Omsk, but Tobolsk continues to have trade in fur, game, and fish. Pop. (est. 1950), 40,000. C. C. H.

**TOBRUCH** or **TOBRUK** [to′bruk], a small port in northeastern Libya, in North Africa, about 75 mi. west of the Egyptian border. It was the scene of heavy fighting early in World War II. The town was captured by the British in their first North African offensive in December 1940, retaken by the Germans and Italians under General Erwin Rommel in June 1942, and recaptured by the British and Australians in November of the same year. Tobruch was developed as a military port by the Italians. It has a small but deep natural harbor and serves as an outlet for the trade of the oases to the south. Pop. 1940, 4,200. A. L. R.

**TOBY, UNCLE,** guileless, lovable uncle of Tristram in Laurence Sterne's *Tristram Shandy.* A retired army captain, he builds miniature fortifications as a hobby and courts the Widow Wadman. W. B. C. W.

**TOCANTINS** [to′kãntī′ns], a river which rises in the state of Goias near the town of Pyrenopolis, central Brazil. It flows northward, forming a section of the boundary between the states of Goias and Maranhão. Near its point of entrance into the state of Pará it is joined by a western affluent, the Rio Araguaia. The northward course of the Tocantins is interrupted by falls and rapids as it crosses the crystalline rocks of the Brazilian highlands. Sixteen hundred miles from its source the Tocantins enters the Rio Pará, the southern estuary of the Amazon River. The Tocantins is navigable for a distance of 120 mi. from its mouth.

P. E. J.

**TOCCATA** [tokɑ′tə] ("touch piece"), a free, virtuosic musical composition especially suited to the keyboard and making use of rapid runs and arpeggios. The toccata figured prominently in the music of the great organists and clavierists of the sixteenth and seventeeth centuries, where its basic, almost Romantic freedom was early offset by alternating fugal sections in the great organ and clavier toccatas of J. S. Bach. This free type of toccata has failed to attract later composers as much as another type, inaugurated by seven-

teenth- and eighteenth-century Italian clavierists: the rapid "perpetual motion" that often borders on the étude. A famous nineteenth-century example is Schumann's Toccata in C major, op. 7 (1830). Debussy, Ravel, Honegger, Prokofiev, and Khachaturian are among twentieth-century composers of extremely effective toccatas. W. S. N.

**TOCCOA** [tɒ′koə], a city in northeastern Georgia, the county seat of Stephens Co., located near the Tugaloo River, 70 mi. northeast of Atlanta. The Southern Railway provides transportation. The city's manufactures include furniture, thread, and machinery. In the neighborhood is Toccoa Falls, 186 ft. high. The city was established in 1872 and incorporated in 1897. Pop. 1950, 6,781.

**TOCHARIAN** [tokɛ′əriən; tokɑ′riən], an Indo-European language which was spoken in earlier times in Central Asia by a people called the Tokhri. Its name is clearly a misnomer, as are "Hittite" and "Hieroglyphic Hittite," but it is by now so frequently used in scholarly works that it will be difficult to replace it. Tocharian is divided into two dialects, frequently called A and B. The speakers of Tocharian A certainly called their own country and language *Ārśi* (*Ārśi-ype, Ārśi-ṣäntu*). The name given to Tocharian B by its speakers is not known.

All of the Tocharian texts (both A and B), with few exceptions, were discovered between 1890 and 1914 in eastern Chinese Turkestan, between the river Tarim and the Tien Shan mountains. The interpretation began in 1907 but proceeded very slowly. The A texts were found only in T'u-lu-fan (Turfan) and Yen-ch'i (Kara Shahr); the B texts were widely distributed. The A texts are exclusively of a religious, specifically Buddhistic, character, and are translations from Sanskrit texts which are now partly lost; the B dialect was used also for medical treatises, legal documents, passports, wall inscriptions, and the like. Some A texts have glosses or titles in the B dialect, and it is therefore possible that B was the living language and A a dead, religious language. Since B was doubtless the language of the kingdom of Kuča (where no A texts have been found), the French scholar Sylvain Lévi proposed the name of Kučean for this dialect, a name which has been widely accepted.

All the B texts date from the seventh century, while the dates of the A texts probably extend from the fifth to the tenth. Both dialects have now been extinct for several centuries and have left no trace.

Tocharian is doubtless an Indo-European language, but it has peculiar characteristics of its own, as, for example, the distinction of the gender in the pronoun "I," where the masculine "I," *näṣ,* differs from the feminine "I," *ñuk*. A sentence like "my love for you" in Tocharian shows immediately whether a man loves a woman, or vice versa (*tñi nukaṃ tuŋk,* but *tñi nṣaṃ tuŋk*). Tocharian has nine cases, which correspond largely to those of the other Indo-European languages in function (it has nominative, genitive, ablative, locative, dative, and instrumental) but not in form. Excepting Irish, Tocharian is the only Indo-European language which entirely confuses the Indo-European velar and labiovelar stops **ḱ* and **ḱʷ*, **g* and **gʷ*, **gh* and **gʷh*. Since all Indo-European stops in Tocharian became nonaspirate and voiceless, all these six (or eight, including **ḱh* and **ḱʷh*) Indo-European phonemes become **k*. Thus Latin *centum* parallels Tocharian A *känt* and B *känte;* Latin *venio,* Greek *βαίνω* and English *come* parallel Tocharian A *kakmu* and B *kekamu;* and Greek *βοῦς*, English *cow,* and Indic *gauṣ* parallel Tocharian A *ko*.

In addition to the *centum* characteristics, Tocharian shows other important connections with Latin and Celtic, such as the endings **-ere* (or **-ero?*) in the third person plural of the perfect (Lat. *tetigere, fecere, dixere;* Toch. A *kaklār, papārsār, yāmär;* Toch. B *weñāre, sākṣāre, wsare*) and the medio-passive in **-r* (Lat. *moritur, sequitur, dicitur;* Toch. A *träṅktar, yärtär, siptär;* Toch. B *yamastr, maskетr, pāṣtar*). But these characteristics (which also survive in Hittite) are mere archaisms preserved in lateral areas. On the other hand, Tocharian shows several innovations in common with Slavic, Greek, and Armenian. In general, Tocharian is certainly an Eastern Indo-European language, largely independent of other Indo-European languages but rather close to Slavic.

Both Tocharian dialects are written in Brāhmi, one of the most frequently used of the Indic alphabets, with some pertinent modifications. The reading of the texts, therefore, presents no particular difficulties. *See also* Lévi, Sylvain; Sieg, Emil. G. B.

**TOCQUEVILLE, ALEXIS CHARLES HENRI MAURICE CLÉREL DE** [tɔ′kvi′l] (1805-1859), French historian and political scientist, was born in Verneuil, July 29, 1805. His education prepared him for the bench, and while still in his twenties he became an assistant magistrate. Soon bored with his duties, he obtained leave to study penal methods in the United States. His book, *La Démocratie en Amérique* (1835), result of a two-year stay in the United States, was the first penetrating analysis of American politics. In America, Tocqueville saw democracy as a system of government which aimed to check absolutism and centralization. He suggested that the leveling of society in American democracy might ultimately weaken resistance to despotism. The publication of this work brought immediate recognition, including membership in the Académie des Sciences Morales et Politiques. He also entered the Chamber of Deputies, becoming vice-president of the Assembly in 1849, and for a few months he served the Second Republic as minister of foreign affairs. Louis Napoleon's *coup d'état* of Dec. 2, 1851, forced Tocqueville into retirement. Returning to his studies, he published in 1856 the first volume of *De l'ancien Régime et la révolution,* which was immediately translated into English. In this classic he reinterpreted the French Revolution as the logical culmination of the Old Regime. His attempted rehabilitation of the Old Regime, though perhaps justified on political grounds, has been all but nullified by the work of historians of the twentieth century. Nevertheless, Tocqueville's study of the Old Regime provided new directions for French Revolutionary studies. He died at Cannes, on Apr. 16, 1859, before completing the later volumes of this last work. R. M. Br.

**TÖDI CHAIN** [tö′di], a part of the northern Alps, located in Switzerland, between the Vorder Rhine Valley and the Swiss Plateau. It is most easily reached from the north by way of Glarus, capital of the canton of the same name in which the chain is situated. The Tödi (or Piz Rusein) is the highest mountain of the range, rising to an elevation of 11,887 ft. Other peaks are Selbsanft (9,935 ft.), Grosse Scheibe (10,023 ft.), and Bifertenstock (11,240 ft.). The Tödi Chain is very popular among mountain climbers and skiers. Passes connect Glarus with the Rhine Valley and can be crossed along easy trails. Most interesting of many valleys is Maderaner Thal, a typical glacial trough (of the Hüfi glacier) with steep slopes rising to snow-clad mountains. S. Van V.

**TOGOLAND,** a trust territory located in West Africa on the Gulf of Guinea and extending inland to 11° 10′ N. lat., between the British Gold Coast on the west and French Dahomey on the east. Germany penetrated from the coast in 1884, 1897, and 1899. Later agreements among Germany, France, and Great Britain fixed the northern territories. German Togoland was surrendered unconditionally to British and French forces in 1914. It was divided between the French and the British in 1919, and in 1922 it was given them as mandated territory of the League of Nations. Following World War II, the United Nations, acting through its Trusteeship Council, assumed supervisory responsibility. As the adjacent Gold Coast, with which part of Togoland has been administered, has become self-governing and is preparing for independence, the question of the future status of Togoland has become critical. The United Nations in 1954 voted to send a special mission to ascertain the wishes of the inhabitants; the mission reported in October 1955 that, in effect, integration with an independent Gold Coast, either immediately for British Togoland or after a prior merger of British and French Togo, appeared the most popular solution, but that a plebiscite was advisable.

From the lagoons of the coast the land rises gradually to 3,600 ft. inland. Streams with waterfalls flow to the coast. The most important of these is the Oti, an eastern tributary of the Volta. Most of its course is in British Togoland, but on its upper reaches it forms part of the boundary between British Togoland and French Togo. The highest part of the territory consists of the Togo Mountains, running from north to south and forming much of the boundary between the two trust territories. The climate on the coast is hot and humid, but on the highlands of the interior it is less enervating. Owing to the abundant rainfall there are long stretches of mangrove swamps and lagoons on the coast, followed by hardwood, dyewood, and oil palm forests; grassland and treeless savannas occur in the north. Corn, yams, cassava, kola nuts, coconuts, and peanuts are cultivated by the natives in the cleared areas.

The population in the south is Negroid, mainly the Ewe tribes, which may be regarded as an offshoot of the Bantu people. In the north Hamitic blood prevails, the chief tribes being the Timi and Dagomba. The majority of the people are pagan, with some Mohammedans in the north, and Christians in the coastal districts.

**British Togoland.** The area allotted to Great Britain as a mandated territory is 13,041 sq. mi., with a population in 1948 or 382,768. Boundary adjustments with the French took place in 1920 by which Lomé and the entire coast were given over to the French in exchange for additional territory in the interior, and further adjustments were made between 1927 and 1929. The northern section of the trust territory is administered as part of the Northern Territories Protectorate of the Gold Coast, the southern section as a division of Gold Coast known as Trans-Volta Togoland.

*EWE PRESBYTERIAN TRAINING COLLEGE, AMEDJOFE, BRITISH TOGOLAND*

COURTESY OF THE BRITISH INFORMATION SERVICES

**French Togo.** This region comprises about three fifths of former German Togoland. It has an area of 21,893 sq. mi., with a population in 1952 of 1,029,946. A commissioner, aided by an advisory privy council and an elected assembly, governs the territory, which is also represented in the National Assembly and the Council of the Republic of France and in the Assembly of the French Union. The port of Lomé, the administrative center, is connected with Anécho and Blitta by railway. *See also* EWELAND; GOLD COAST.

W. M. W.

**TOJO, HIDEKI (or EIKI)** [tojo] (1884-1948), Japanese general and statesman, was born in Tokyo, Dec. 30, 1884. His military career included duty as inspector general of army aviation and chief of staff of the Kwantung Army. Belonging to the Kwantung Army clique, exponents of Japanese domination of East Asia by force if necessary, he prepared plans for the "China Incident" of 1937. He was vice-minister and later minister of war in the three Konoye cabinets and was premier from October 1941 to July 1944, resigning with his cabinet after the fall of Saipan. Immediately before his arrest as Japan's chief war criminal, he attempted suicide on Sept. 11, 1945, but recovered and stood trial. Convicted of war crimes on nine counts, Tojo was hanged on Dec. 23, 1948, in Tokyo.

**TOKUGAWA, IYEYASU.** *See* IYEYASU (OR IYEYASU TOKUGAWA).

**TOKUSHIMA** [tokushima], the capital of Tokushima Prefecture on the northeastern coast of Shikoku Island, southwestern Japan. The city has a mild climate. Its hinterland is rugged and heavily forested except for the Yoshino River valley. Tokushima is a cotton-textile center; fishing is also an important industry. The city developed around a small hill fortified by a castle which was destroyed in the Restoration Wars in 1868. The castle site is now Tokushima Park. Komatsushima, 7 mi. southeast, is the port for Tokushima. Pop. 1952, 133,332.

EWING GALLOWAY

*STROLLERS IN UYENO PARK, ONE OF TOKYO'S MANY FINE PARKS*

**TOKYO** [tokyo; to′kio], the capital of Japan and one of the world's largest cities, 220 sq. mi. in area. It is on the east central coast of Honshu Island at the northwestern end of Tokyo Bay and at the mouth of the Sumida River. The mean annual temperature is 57° F. About 64 in. of precipitation falls annually. September is the wettest month and December the driest.

Tokyo was formerly called Edo, or "Estuary Gate," and in the twelfth century it was a small village. In 1590 Iyeyasu, founder of the Tokugawa shogunate, made it a provincial capital, and after he became a shogun in 1603 the city increased in size; eighty thousand retainers, in addition to the families of most of the nobles who were required to live in the city as hostages, swelled the population. The swamps were drained, canals were built, and streets were widened. In 1731 the population was 561,900, and by 1787 it numbered 1,367,900, making Edo one of the largest cities in the world. In 1868, when the imperial regime was restored, Edo became the capital of Japan and the name was changed to Tokyo, or "Eastern Capital."

In the center of the city is the Imperial Palace, from which the principal streets radiate. Tokyo is divided into two general areas: the Yamate, or residential section on the higher parts of the city, and the Shitamachi, or commercial and industrial area. The center of the commercial district is the Marunouchi, which has many large modern buildings. The Nihombashi commercial area is also important, and the Ginza street is the principal shopping center. Though Tokyo is best known as the educational, cultural, financial, and administrative center of Japan, it rivals Osaka in the diversity and importance of its industries, heavy industry alone being relatively unimportant. There are more than 200 mi. of trolley lines, two important subways, and many canals in the city.

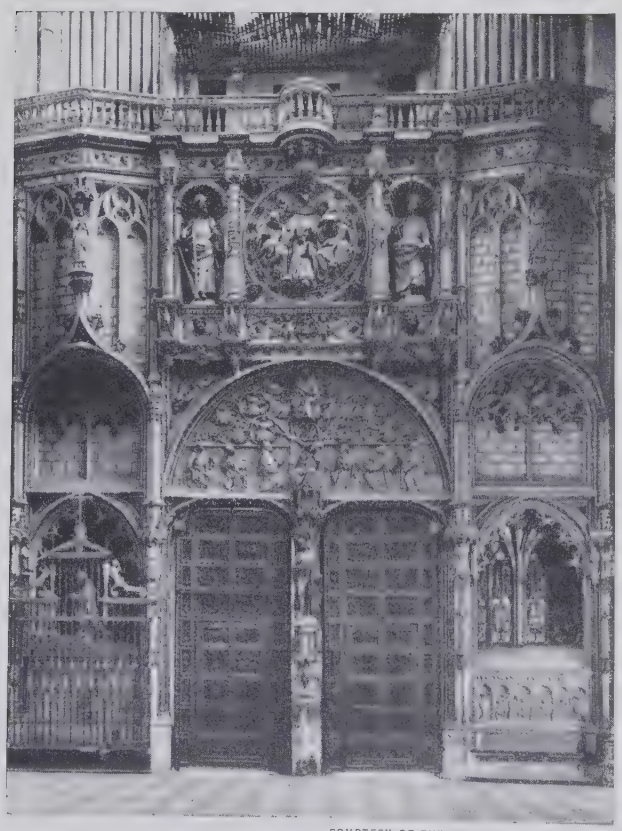
Among Tokyo's many museums are the National, Metropolitan Art, Modern Art, Okura Art, Bridgestone, Military, Patent, Transportation, Communications, Folkcraft, and Science museums. There are also many zoological and botanical gardens, Christian churches and meeting places, and famous Shinto shrines such as the Yasekuni, Meiji, and Nogi. Millions worship at the Meiji Shrine and visit the 175-acre gardens surrounding it. There are numerous national, prefectural, and municipal government buildings, banks, large stores, and hotels, among which the Imperial Hotel designed by Frank Lloyd Wright in 1915, fronting on Hibiya Park, is the most famous. Other large parks are the Asakusa, Sumida, Shiba, and Uyeno. Greater Tokyo has a total of 137 institutions of higher education, 11 being National Universities, including Tokyo University.

The earthquake and fire of 1923 destroyed a large part of the city, which was rebuilt in modern Western style. The shallow harbor was dredged to allow 6,000-ton vessels to dock. Larger ships dock at Yokohama. Tokyo was repeatedly bombed in 1945 by both carrier-based planes and B-29's. On Mar. 9, 1945, about 15 sq. mi. of the city was burned, and again on April 13 about 5 sq. mi. were burned. Modern office buildings withstood the air attacks fairly well, but residential and older areas were destroyed. The surrender of Japan after World War II took place on the U.S.S. *Missouri* in Tokyo Bay, Sept. 2, 1945, and Gen. Douglas MacArthur, Supreme Allied Commander, established his headquarters in Tokyo. Pop. 1954, 5,385,071.

**TOKYO UNIVERSITY,** at Tokyo, Japan, founded in 1877 as the Tokyo National (Imperial) University. It began as a merger of three institutions: Shoheiko (1790) for the study of Confucian classics, Kaiseigo (1855) for occidental learning, and Igakusho (1863) for the study of occidental medicine. In 1947 "Imperial" was deleted from the title and its present name became official. Associated with the university are a number of institutions: Tokyo Astronomical Observatory (1888), Historiological Institute (incorporated 1888), Institute for Infectious Diseases (incorporated 1916), Aeronautical Research Institute (founded 1918 and abolished in 1946), Earthquake Research Institute (1925), Institute for Oriental Culture (1941), Radiation Chemistry Research Institute (1945), Physiographical Science Research Institute (1946), Institute of Science and Technology (1946), and Institute of Social Science (1946). The present university departments include engineering and industrial engineering, agricultural science, literature, medicine, law, and education; with a faculty of 863 members and a student enrollment in 1948 of 10,717. Of particular interest are the main library and its 140 branches with a total of nearly 1,277,000 volumes. After destruction by earthquake of the original structure, the present main building was built in 1928 with a fund of 4,000,000 yen donated by John D. Rockefeller. In addition to this university library there are nine other affiliated university libraries in Tokyo with a total listing of 1,605,463 volumes. A. L. H-Q.

**TOLEDO** [tole'tho], a province in central Spain and its capital city. The province was once a part of New Castile, of which Toledo, the city, was capital.

**The City.** The city of Toledo is situated on a steep, rocky hill on the right bank of the Tajo (Tagus) River, about 40 mi. southwest of Madrid. The gorge of the Tajo bounds the city on the east, south, and west; to the north lie a double wall and steep cliffs. Two ancient bridges cross the Tajo at Toledo: one, the Puente de Alcantara, was constructed by the Romans and was later rebuilt by the Arabs in 977 and by the Castilians in 1258; the other bridge, the Puente de San Martín, was erected in 1212. Toledo lies at the end of a branch line of the railway running through Aranjuez to Madrid. It has a continental climate, with hot summers and cold winters, and has an average of 14 in. of rainfall annually.



COURTESY OF THE SPANISH TOURIST OFFICE

*THE FAÇADE OF THE CATHEDRAL IN TOLEDO, SPAIN*

Toledo's history goes back to the Greeks and Phoenicians. A flourishing city by the time of the Roman Empire, it assumed even greater importance in the sixth century when the Visigothic kings made it their residence. The Moors captured Toledo in 712 and made it their military headquarters for that part of Spain. The Toledans frequently rebelled, and established their independence on several occasions. The Arab influence was strong, however, and many of the Spanish and Jewish natives of the city adopted Moorish ways and the Arabic language. After Alfonso VI of Castile captured Toledo in 1085, with the aid of the Cid, these Mozarabs, or "half-Arabs," were allowed to speak Arabic for almost five centuries, until the Inquisition forced them to return to Spanish ways. In 1561 Philip II moved his capital from Toledo to Madrid, and from that date the city declined. The population of Toledo in 1950 numbered little more than one fifth of the 200,000 it is said to have totaled at one time.

Sprawling unevenly over the hilly terrain, Toledo is a veritable museum of history and architecture. The fundamental Moorish aspect of the city remains despite the fact that the Christian reconquerors rebuilt half of Toledo. Steep, narrow, winding streets, many of which are cul-de-sacs, add to the Moroccan appearance. The houses, for the most part, are built around interior patios and there are few public squares or plazas. Although Toledo is the central market town for the surrounding area, traffic in the city is almost never heavy. The Cathedral, in the center of town, marks the site of a sixth-century Visigothic church and a later Moorish mosque. It was completed by 1493 and is a striking combination of architectural styles but, unfortunately, is hemmed in and all but surrounded by other buildings. Many other churches, several of them rebuilt from Moslem mosques, stand in the city. The Alcazar, a huge, square edifice with towers at each corner, stands on the highest ground in Toledo and dominates the city. Once the palace of Castilian monarchs, it has been utilized as a fortress and as a school, and has been burned and damaged many times, most recently in 1936 during the Spanish Civil War, when a group of Insurgents withstood a Loyalist siege for 70 days.

Once one of the great cities of Spain, Toledo now has little commercial or political importance. Aside from the continued production of "Toledo blades," swords of remarkable quality famous since Roman times, Toledo depends on the tourist trade and its position as provincial market center for its economic livelihood. It still retains much of the religious importance that it has held since the pre-Moorish Councils of Toledo, and is the seat of the Catholic primate of Spain. Pop. (off. est. 1947) 40,210.

**The Province.** The province of Toledo, located in the geographical center of Spain, has an area of 5,919 sq. mi. and is bounded on the north by the provinces of Avila and Madrid, on the east by Cuenca, on the south by Ciudad Real, and on the west by Cáceres. The province lies within the watershed of the Tajo River, except for the southeast corner, which is drained by tributaries of the Guadiana. The prov-

ince extends into the foothills of the Sierra de Gredos in the northwest while the Montes de Toledo run along the southern border. Irrigation is practiced along the valleys of the Tajo and its principal tributary, the Alberche, and agriculture flourishes in these areas. Wheat and other cereal grains, grapes, and citrus fruits are grown successfully. In the higher regions of the province where sheep raising is important, the population is relatively sparse. Much of the land in the province is owned by absentee landlords, and the inhabitants tend to congregate in small urban settlements. There is almost no mining and only a few, small, traditional industries. Several of the railroads radiating from Madrid pass through the province.

Toledo, the capital, is the largest city, while Talavera de la Reina, near the confluence of the Tajo and the Alberche, and Mora are other towns of importance. English forces, led by Arthur Wellesley (later Duke of Wellington) defeated the French under Joseph Bonaparte at Talavera de la Reina in 1809. Pop. 1950, 533,654. R. G. W.

**TOLEDO** [toli'do], a city and port of entry in northwestern Ohio, the county seat of Lucas Co., situated at the mouth of the Maumee River. The largest river flowing into the Great Lakes, the Maumee empties into Maumee Bay at the westernmost tip of Lake Erie, 113 mi. west of Cleveland. Toledo lies on both sides, but mostly on the west bank of the river, over which are 9 connecting bridges. A natural harbor, extensive water frontage, a deep channel, and 14 railroads combine to make Toledo a center for rail- and water-borne commerce. The city ranks eighth among ports of the United States in tonnage handled and second among cities on the Great Lakes. A leading coal port, it handles approximately half the total coal tonnage of all the Great Lakes ports combined. Much iron ore, grain, and oil clear through the port, which has direct oil pipeline connections with the Oklahoma oil fields. Passenger transportation is provided by the Baltimore & Ohio, Chesapeake & Ohio, New York Central, Pennsylvania, and Wabash railroads, and the Capital, Delta-C&S, Trans World, and United airlines.

After the Battle of Fallen Timbers (Aug. 20, 1794), about 12 mi. southwest of Toledo, Gen. Anthony Wayne built Fort Industry, and on that site a few years later the village of Port Lawrence was established. A rival village, Vistula, was formed a mile away and in 1833 the two joined to become Toledo and were finally incorporated as a city in 1837. During this interval the so-called Toledo War took place between Ohio and Michigan in a boundary-line dispute over the Toledo strip. Congress decided in favor of the Ohio claim in 1836. Samuel M. Jones, known as "Golden Rule Jones," was elected mayor on a nonpartisan ticket and served from 1897 to his death in 1904. The "Golden Rule" policy practiced in his business continued in his private war on the misuse of public funds, bossism, and favoritism in city government. Brand Whitlock, his successor, carried on the independent movement for four terms. In 1934 Toledo adopted the city-manager form of government.

Educational and cultural facilities in the city include the University of Toledo, Mary Manse College for Women, and the Toledo Museum School of Design. The Toledo Museum of Art has one of the finest collections of glass in the world. The Zoological Gardens rank among the nation's finest. Another point of interest is Our Lady of the Holy Rosary Cathedral, an outstanding example of Spanish architecture. Fort Meigs State Park is about 12 mi. south of Toledo. Remnants remain of the fort built by General Harrison during the War of 1812. The Anthony Wayne High Level Bridge, one of the largest full suspension-type structures in the Midwest, spans the Maumee River.

Toledo is a center for the manufacture of glass, and automobiles, spark plugs and other motor accessories, oilfield equipment, and plastics are important. Other products include automatic scales, gas furnaces, leather, canvas goods, machinery, die castings, metal stampings, and clay products. The city has railroad shops and shipyards, and stone, gypsum, and cement quarries are in the vicinity. Milling is an important industry, since Toledo is in the grain belt and huge grain elevators are available for storage. The city is also a leading market for hay, clover seed, coffee, and spices. Pop. 1950, 303,616. H. S.

**TOLEDO, UNIVERSITY OF,** an accredited, coeducational, municipally controlled institution situated on a campus of 160 acres in Toledo, Ohio. It was chartered as a private institution in 1872. In 1884 the city of Toledo took over the university. The numerous divisions of the university were founded as follows: College of Medicine, 1894 (discontinued, 1912); College of Arts and Sciences, 1909; Graduate Study Division, 1912; College of Education and Junior College, 1916; College of Business Administration and College of Engineering, 1930; College of Law, 1934; College of Pharmacy, 1938; and General Division, 1945. Degrees offered include the A.B.; B.S.; B.S. in medical technology, nursing, and liberal arts; A.B.; B.B.A. and B.B.S. in business administration; A.B., B.S., B.Ed., and Bachelor of Vocational Education in education; B.S. in chemical, civil, electrical, mechanical engineering and engineering physics; LL.B.; B.S. in pharmacy; M.S.; M.B.A.; and M.A. Two-year certificates are conferred by the junior division. Military science is optional in the Army R.O.T.C. unit. A few scholarships are available, and there is a small student-loan fund. There are dormitories for men and women who do not commute. Fraternities and sororities exist on the campus; some undergraduates live in their chapter houses. *For statistics see* COLLEGES AND UNIVERSITIES. J. R. To.

**TOLERANCE.** Tolerance may be defined as the inclination and capacity to establish and preserve community with people who differ in some respect from the general type or consensus. Tolerance is a difficult and a rare achievement for the simple reason that consciousness of kind is the primary basis of community. We are drawn together in community with those who share our convictions, or who have a common language or culture with us, or who belong to our ethnic group. Common language and the sense of ethnic kinship are, in fact, the most primordial bases of community through all the centuries. On the other hand, we tend to be hostile to, or fearful of, those who are "different." The difference may be on any level of biological, cultural, or political reality.

Toleration is thus a necessity of health for both the individual and society. No individual can be healthy without learning to "get along" with people who differ from him in one or many respects. On the other hand, toleration is the necessary price of social peace in any creative community.

The ability to get along with people who are different has always been a rare personal achievement and a communal necessity throughout human history. But it has become an even more urgent problem as modern communities became ever more pluralistic.

Modern national communities, and, above all, the nascent world community, have nevertheless established, or are under the necessity of establishing, community among people who

diverge from a type, or challenge one another's basic convictions, or compete with cherished interests. All modern nations are culturally, religiously, and politically more pluralistic than the traditional communities of human history, which maintained their unity upon the basis of fundamental conformities in culture or religion. Conformity as a basis of community was, in fact, regarded as so necessary that even after the Renaissance and the Reformation destroyed the uniformity in the culture of Europe, the treaty of Westphalia, ending the thirty years of religious wars, provided for the religious conformity of particular communities through the formula *cuius regio, eius religio*. This formula insured at least conformity between the prince and the people in matters of religion.

Cultural and religious pluralism nevertheless entered Western culture, particularly in the Anglo-Saxon world, and the tolerance required to establish community under the conditions of pluralism was, on the one hand, the necessary by-product of this pluralism and, on the other hand, the precondition of the further development of pluralism.

The decisive chapter in the history of toleration was enacted in the Cromwellian period of seventeenth-century England. In that period, the various Puritan sects which composed Cromwell's army broke the cultural and religious unity of the nation. Only the Independents and the Levellers were honestly interested in liberty and toleration. Their commitment to the principle of liberty was a necessary precondition of the pluralism because they stated the principles which would validate toleration. Those principles were that no conviction was so infallible as to warrant the suppression in its favor of other convictions in a community. Said John Saltmarsh, one of the great proponents of toleration in the Cromwellian period, "Thy evidence is as dark to me as my evidence is dark to thee until the Lord enlighten all our seeing."

On the whole, toleration was established in both England and America, not so much as an ideal principle, but under the compulsion of necessity, once the monolithic unity of the society had been destroyed. It was found, in short, that a community would have more peace without the attempt to superimpose religious unity than if that attempt, usually abortive, were made. Thus the community, under social necessity, achieved toleration and peace far beyond the ideals of the various warring groups.

In our own nation, this cultural and religious pluralism was even more an established fact, even though the New England colonies were originally lacking in every inclination toward toleration. But in the great struggle of the Revolutionary War of independence, the various colonies with their disparate religious cultures were welded together into a single nation.

It therefore became an absolute necessity to build our national community upon the basis of toleration. Many of our founding fathers, particularly Jefferson and Madison, genuinely believed in toleration; but those who did not believe were nevertheless persuaded to accept toleration because the religious pluralism of the new national community made any other alternative unthinkable.

This experience suggests that the requirements of social peace under conditions of pluralism are actually the chief incentives to toleration. We establish community with those who are different simply because we are thrown into a situation of potential community with them. We are thus forced to restrain our impulse to establish community only with those who are like us, or think as we do.

Inevitably, some lessons are learned from these necessities which support the thesis of the idealists who advocate tolerance for the sake of giving the community richness and variety and for the sake of emancipating the individual from restraining conformity to common cultural standards. Tolerance is not merely a necessity of social peace under conditions of cultural, religious, and ethnic heterogeneity. It is a requirement for the enrichment of the community as well as for the emancipation of individual creativity from the restraining conformity of the community.

It is significant that the problem of toleration first arose on the religious level in Western civilization; and that religious toleration became the seed of all the freedoms which have developed in a free society. It is sometimes assumed that toleration of men who hold different religious convictions is the most difficult of all achievements. This judgment assumes that religion is inherently fanatical—and this, indeed, is partly the case, in the sense that religion deals with ultimate commitments which engage the whole of the person. Ideally, a true faith should generate charity rather than fanaticism, because it subjects fragmentary and parochial historical values and commitments to the scrutiny of the ultimate and divine. But actually, the religious person is easily tempted to sanctify his parochial values by the sanctity of the absolute of his devotion; and to claim God as an ally for his cause. Therefore, religion tends to add a particular depth and virulence to parochial fanaticisms, whether they be cultural, national, or ethnic. It is, however, erroneous to assume that religion is the only source of fanaticism and that its abolition would create the spirit of tolerance.

The Enlightenment of the eighteenth century, which is frequently credited with the spirit of toleration, generated a very virulent Jacobin rationalistic fanaticism. The only significant champion of toleration in the Enlightenment was Voltaire. The dictum attributed to him, "I disagree with what you say, but I will defend to the death your right to say it," expressed the classical theory of toleration. But it is fair to remark that Voltaire acquired this spirit from enviously observing the social peace of England under conditions of religious pluralism and the beneficent effects of the religious toleration established there in the seventeenth century. France did not acquire this social peace and toleration for many years, not only because of the fanaticism of the defenders of the traditional society and culture, but because of the fanaticism exhibited by the rationalistic defenders of the new culture.

The fact is that any commitment, religious, political, or cultural, can lead to intolerance if there is not a certain degree of residual awareness of the possibility of error in the truth in which we believe, and of the possibility of truth in the error against which we contend. It is an ironic fact that the modern generation which celebrated its emancipation from traditional religious fanaticisms has been engulfed in the strife between fanatic political creeds which did not allow any community at all except on the basis of political conformity.

These new political fanaticisms threaten to destroy free communities in which the original cultural and religious tolerance has been elaborated into both political and economic freedom. Political freedom requires that the political opponent be trusted sufficiently to permit the opposition to campaign and organize in order to supplant the regnant government. Economic freedom requires the toleration of competitive economic interests. Such competition, with proper safeguards, has made for a more harmonious community, offering incentives to the initiative of various per-

sons and groups, which has proved more vital than the social peace maintained by the fiat of governmental intervention. In short, the "limited warfare" in the field of both politics and economics, which is so necessary for the vitality of modern society, is the last fruit of the attitude of toleration which includes not only the person who is "different," but the opponent.

Toleration of persons who are different in kind requires an awareness of the similarities and identities above and beneath the differences; it requires an awareness of a common humanity, for instance, underneath ethnic distinctions. It is therefore a spiritual achievement of great moment. Toleration of people who differ in convictions and habits requires a residual awareness of the complexity of truth and the possibility of opposing views having some light on one or the other facet of a many-sided truth. In that sense, what the orthodox conformist would define as heresy in either politics or religion may frequently be only an awareness of a neglected facet of the truth. The capacity to comprehend various facets of a truth, or to become aware of the parochial nature of the truth to which one is committed, may be both an intellectual and a religious achievement. It may be achieved, at any rate, both by a rational and discriminating analysis of the complexities in which any truth is inevitably involved and by a spirit of religious humility which is willing to recognize the conditioned character of the historical formulation of even the most ultimate and absolute truth.

While tolerance, or the capacity to establish and preserve community with people who differ from us in any respect, must therefore be regarded as a virtue which may be as rare as it is valuable (since the natural inclination of human nature is to be in community on the basis of consciousness of kind), there are nevertheless two limits to the virtue of tolerance. One of those limits is the tendency of toleration to result in a spirit of indifference to values which ought to secure commitment. "Tolerance is a virtue of people who don't believe in anything," declared Gilbert Chesterton, in calling attention to one of these limits. Unless the spirit of toleration involves a clear and firm commitment to a higher value than the ones in dispute, it may empty life of meaning and importance.

The other limit of tolerance is given by two necessities. The one is the necessity of establishing minimal standards of moral decency from which the community cannot allow serious deviations. The other arises from the necessity of protecting the community against conspiracies and treason, particularly against treason originated by fanatic and totalitarian political movements which would annul the freedom and justice of the community. But even in this realm, in which the standard must be to be intolerant of intolerance, it is necessary to preserve discriminate judgment, lest divergence from a traditional norm be falsely defined as treason against the basic value of freedom and toleration. In most modern free communities, for instance, the debate on how much or how little economic enterprise shall be politically regulated for the sake of preventing catastrophic fluctuations and insuring minimal standards of social well-being and security, is inevitable and necessary. It is also, and must remain, inconclusive, since the values of freedom and security are both desirable and, in some respects, incompatible. Whether one or the other is preferred is determined, on the whole, by ideological presuppositions of the various classes. Those who have security, whether by their own skills or by their wealth, will prefer liberty over security; while the industrial workers will prefer security to liberty. There is no way of dissolving these ideological preferences, or of resolving the debate between the classes about these preferences. Therefore, every modern democratic society must guard against incorporating one or the other preference prematurely into the basic norms of society. The debate must be kept open and society must achieve peace through the tolerant attitude of each side toward its ideological opponents. In this, as in other cases, a free society must rely on the "limited warfare" which is the prerequisite of community under conditions of freedom. Such limited warfare is the essence of the creative tension between opposing economic and political forces within the framework of social peace. It can be successfully maintained only in the spirit of toleration, that is, by the achievement of the capacity to preserve community with those who differ from us. R. N.

**TOLERANCE** and **ALLOWANCE,** the deviation between the nominal dimensions and the fits of mating parts. In actual manufacture, exact dimensions never exist. The variation in the size of parts can be reduced but never can be eliminated entirely. It is neither possible to gauge parts absolutely accurately nor to set machinery in such a way that one part will be exactly like another. It is necessary, therefore, in order to make large-scale manufacturing possible, to permit some variation in the size of parts without impairing their performance. This permissible deviation in dimensions of parts from a nominal dimension is called tolerance, which may vary from 1/64 in. to a few millionths of an inch, depending on the intended purpose. In general, the smaller the tolerance, the greater the cost per unit. Tolerance may be either unilateral or bilateral. Unilateral tolerance means that the deviation in the nominal dimension or basic dimension is in one direction only, whereas for bilateral tolerance it may be either greater or less. For example, if the dimension of a part is given as $2.000\ ^{+\ 0.003}_{-\ 0.000}$ in. the tolerance is unidirectional; if the dimension is given as $2.000 \pm 0.003$ in., the tolerance is bilateral.

In order to permit assembly of parts and to permit their proper performance, it is necessary to specify a certain minimum clearance between mating parts. This minimum clearance is called the allowance, and is determined in the case of a hole and its mating shaft by the largest shaft and the smallest hole. To illustrate tolerance and allowance, assume the following dimensions: shaft diameter, $1.496\ ^{+\ 0.002}_{-\ 0.000}$ in.; largest shaft, $1.496 + 0.002 = 1.498$ in.; smallest hole, $1.500 - 0.000 = 1.500$. Here the allowance is 0.002 in., and accordingly the tolerance of the shaft and hole is 0.002 in. E. T.

**TOLERATION ACT,** a statute granted by William and Mary in 1689 providing a certain measure of equality to English Protestant Nonconformists. The Protestant Nonconformists had rejected the Roman Catholic James II's offers of toleration and had joined the Church of England in driving him off the throne. They had to be rewarded, but were compensated grudgingly. The repressive acts of the Clarendon Code were not repealed but merely suspended in favor of anyone who would take the oaths of allegiance and supremacy and make the declaration against transubstantiation; thus the members of the Roman Catholic Church were excluded from toleration, and by the earlier Corporation Act of 1661 and Test Act of 1673, Nonconformists

were still legally excluded from civil, municipal, and military office. E. R. A.

**TOLGUACHA** [tɒlgwɑ′tshə], a beautiful herbaceous perennial, *Datura meteloides,* a member of the nightshade family, growing about 2 ft. high. It has fragrant, trumpet-shaped flowers, often becoming as large as 6 in. across. In color these flowers are white, tinged with violet or purple. The leaves are grayish, and are borne on slender, forked stems. This perennial is native to the southwestern United States, and is often cultivated in gardens as an annual. Because of its narcotic properties, the plant was used medicinally by various Indian tribes. M. G. W.

**TOLIMA** [toli′mɑ], a dormant volcano of western Colombia and the second highest peak (18,438 ft.) of the Colombian Andes. It is situated 15 mi. north of Ibagué and its snow-capped summit is visible from Bogotá, 80 mi. east. The peak towers above the crest level of the Cordillera Central. It overlooks the Quindío Pass, through which runs the highway connecting the Magdalena and Cauca valleys. P. E. J.

**TOLLER, ERNST** [tɔ′lər] (1893-1939), German dramatist, was born in Samotschen, Prussia, Dec. 1, 1893, the son of a Jewish merchant. After studying in the *Realgymnasium* at Bromberg and the University of Grenoble, he served on the western front in World War I until invalided home in 1916, when he enrolled at the University of Munich. He joined Kurt Eisner in the revolutionary strike of 1917 and

ERNST TOLLER

BROWN BROS.

was imprisoned, but in 1918 he became a member of Eisner's Bavarian government and head of the council of workmen, peasants, and soldiers. Toller was implicated in the Munich Communist rebellion, was arrested in 1919 and sentenced to five years of "honorable fortress imprisonment," and in 1924 was exiled to Saxony. His first satirical farce, *Wotan Unchained,* written in prison, uses Adolph Hitler as the model of Wotan, the barber-orator, who becomes dictator of an antidemocratic and anti-Semitic movement which promises everything to its followers. He was exiled from Germany in 1933 and committed suicide in New York, May 22, 1939. *Masses and Man* and six of his other ideological plays have been translated into English. He also wrote *No More Peace; Pastor Hall;* an autobiography, *I Was a German;* and several volumes of verse, most of which were composed in prison. R. H. L.

**TOLSTOY, ALEXEI KONSTANTINOVICH** [tʌlstɔi′, tɒlstɔi′] (1817-1875), Russian poet, novelist, and dramatist, was born in St. Petersburg, Aug. 24, 1817. He spent most of his early years on his uncle's estate in the Ukraine, and traveled widely. A friend of Alexander II, he declined the Tsar's appointment as aide-de-camp and contented himself with the honorary title of court huntsman, a post that gave him unlimited opportunity for the pursuit of his two favorite hobbies, hunting and art. He lived a peaceful and relatively uneventful life as an aristocratic gentleman. His first novel, *The Vampire* (1840), was based on Italian life, but he is best known for his ballads, based largely on Russian history; his historical novel, *Prince Serebryany* (1863), set in the time of Ivan the Terrible; and his dramatic trilogy (1866-1870): *The Death of Ivan the Terrible, Tsar Fyodor,* and *Tsar Boris.* The last two plays were for many years under the ban of the censor, for in *Tsar Fyodor* Tolstoy showed the tragic fate of the kindly Fyodor, who, pathetic in his desire to do good, was unable to find his way amid the troubled politics of the day and brought evil on all whom he desired to help.

Tolstoy was a confirmed Westerner and perhaps appreciated better than any other Russian author the real significance of the Western belief in freedom and human dignity. He visualized this as existing in Kiev before the time of the Tartar invasions, and he contrasted this free and civilized existence, when Kiev formed part of the Western world, with the rigid tyranny of Ivan the Terrible and the system of Moscow, which still continued in his own day. Among his outstanding poems are *St. John Damascene,* in which he emphasizes the freedom of art, and the *Dragon,* a tale of Renaissance Italy. There was nothing pompous or stiff about Tolstoy's writings, and he composed a number of satires, among them a comic history of Russia, emphasizing the Russian search for order, and the *Hero Potok,* criticizing both the tyranny of Moscow and the absurdities of the radicals of his own day. In the same vein, Tolstoy and his cousins, Alexei and Vladimir Mikhailovich Zhemchuzhnikov, created the character and writings of Kozma Prutkov, one of the most amusing hoaxes in Russian literature. Prutkov was represented as a thoroughly limited bureaucrat with ambitions to become a writer; the tastelessness of his poems and his general stupidity satirically demolished the literary claims of many minor writers who were being overpraised by some of his contemporaries.

Tolstoy died on his estate of Krasny Rog, Sept. 28, 1875. He was much criticized for his failure to join any of the social schools of the day, but his humane spirit, his high ideals, and the beauties of his work assure him of a high place in Russian literature. C. A. M.

**TOLSTOY, ALEXEI NIKOLAYEVITCH** [tʌlstɔi′; tɒlstɔi′] (1883-1945), Russian novelist and playwright, was born Jan. 11, 1883, in Sosnovka, a village in the Samara region. His father was a small landholder and his mother a minor writer. He was a distant relative of Count Leo Tolstoy. His activity as a writer began in 1907 with the publication of a book of lyric poems, and continued through World War II until his death on Feb. 23, 1945. During that time he produced many novels, short stories, and plays on a great variety of themes. His reputation was already established before World War I with a number of stories dealing with the life of the Russian country gentry.

His most important contribution to Russian letters falls within the Soviet period. He did not at first accept the Revolution, and chose to spend the early years of the Soviet

regime in exile in Paris (1918-1921). Later he became reconciled to the new order, and after his return to the U.S.S.R. was one of the leading figures in Soviet literature, having been decorated for his services as a writer and twice awarded the Stalin Prize for outstanding contributions to literature.

In the middle twenties Tolstoy wrote a number of fantastic stories: *Aelita* (1922), dealing with a social revolution on Mars; a play, *The Revolt of the Machines* (1925); and *Engineer Garin's Hyperboloid* (1926), the story of a scientific superman who attempts to enslave the world. *Azure Cities* (1927) describes the struggle of modern science with the primitive backwardness of the Russian village. *Road to Calvary,* a trilogy begun in Paris in 1921 and completed in 1941, is his most important single work, giving a realistic picture of Russian society, especially the upper-class intellectuals, through the years of war and revolution. His *Peter the Great* (1934) is regarded as the best Soviet historical novel. In World War II Tolstoy was active as a journalist and a writer of war stories.

Tolstoy is significant chiefly as a novelist who has continued into the Soviet period the tradition of Russian psychological realism, and as one of the leading Russian writers of historical fiction. E. J. B.

**TOLSTOY, COUNT LYEV NIKOLAYEVICH** (1828-1910), Russian novelist and writer on religion and ethics, was born Sept. 9, 1828, at Yasnaya Polyana, near Tula. After study with private tutors, he attended the University of Kazan, but did not graduate. In 1851 he went to the Caucasus, where in the next year he entered the army and served in campaigns against the mountaineers and in the defense of Sevastopol, leaving the army in 1856.

Tolstoy's first published works, dating from 1851 to 1856 (*Childhood, Boyhood, and Youth; Sevastopol Sketches;* and other tales), already show his distinctive methods. He is primarily interested in character, paying little heed to his plots, and he describes his character mainly by citing small acts that illustrate emotions and motives. He is preoccupied with the moral life, showing his heroes trying to be good, stumbling and failing, but never deserting their ideals. He gives wonderful descriptions of external incidents and of scenery, but always from the point of view of the actors in his stories.

During the period 1856-1862 Tolstoy was absorbed in the education of peasant children and wrote little fiction. He conducted a school on his estate, studied educational systems during a trip to western Europe, and also published a small pedagogic magazine. He reacted violently against the prevailing methods of education, maintaining that a teacher must aid a child to develop his own capacities and that in doing so, the teacher may impart useful knowledge, but not his own point of view. Governmental interference in education Tolstoy regarded as harmful; his mental outlook was already fundamentally anarchistic.

In 1862 Tolstoy married and settled down on his estate of Yasnaya Polyana. The next sixteen years saw his most copious artistic production—*War and Peace* (1863-1869) and *Anna Karenina* (1873-1878). His writings always being autobiographic, Tolstoy showed himself dominated by the interests of family life, a life that had rescued him from dissipation. While in his earlier writings women had been comparatively unimportant, he now drew them with marvelous skill.

Meanwhile he had been experiencing a religious crisis. Life ceased to have a meaning for him, and he learned that it was equally meaningless to all intelligent men of his own class. He yearned to kill himself, but he saw that the peasants, through their religion, found life profitable and full of meaning, and he therefore accepted the religion of the Russian Church, only to have his moral nature revolted by its denunciation of other faiths and by its apology for war. He strove to formulate a religion of his own on the basis of Christ's teaching in the Gospels, and a short, vehement, autobiographic work, *My Confession* (1879), tells of his religious struggles.

In 1880 Tolstoy wrote his *Critique of Dogmatic Theology,* which concludes with an indictment of the Church teaching

*COUNT LYEV NIKOLAYEVICH TOLSTOY*

CULVER SERVICE

that blasphemy against the Holy Ghost is the unpardonable sin. Meanwhile he studied Greek and, in the years 1880-1882, composed his *Harmony and Translation of the Four Gospels,* which he regarded as his greatest work. He found the central doctrine of Christ in the words, "Resist not the evil-doer; but whoever smiteth thee on the right cheek, turn to him the other also" (Matt. v: 39). Of his ethical system he gave a popular exposition in *What I Believe* (or *My Religion*) (1883). Since all government depends on resistance to evil men, Tolstoy argued, no true follower of Christ can share in military or civil administration or even hold property. He developed further this doctrine of Christian anarchy in *What Shall We Do Then?* (1884-1886), with its heartbreaking picture of the Moscow slums, and *The Kingdom of God Is Within You* (1891-1893). Of all these works only fragments could be printed in Russia; they were published in full in Switzerland or in England. Tolstoy believed fervently in God, but thought that any attempt to define His nature removed men from Him. Jesus he regarded simply as a man, a great teacher. In *What I Believe* he rejected the doctrine of immortality; in 1898 he returned to faith in it.

During 1878-1885 Tolstoy wrote no fiction save a few short stories, mainly didactic. In 1886 he produced *The Death of Ivan Ilyich,* a tale some eighty pages long, and *The Power of Darkness,* a drama. Unlike his earlier fiction, these powerful works concentrate on the portrayal of suffering, meanness, and crime; their leading characters have at last glimpses of a regenerate life. As time passed Tolstoy became a more and more relentless puritan. In *What Shall We Do Then?* he exalted family life, but in *The Kreutzer Sonata* (1889) he reversed his position, finding the sex instinct inconsistent with true religion, and advocated absolute chastity as a universal ideal. Yet in the same year he wrote a jovial comedy, *The Fruits of Enlighten-*

*ment,* and in 1901 he composed *Hadji Murad,* a story in which he pictured admiringly a Mohammedan warrior of the Caucasus who stoutly resisted Russian rule. In 1897 he published *What Is Art?,* a treatise containing much pungent criticism from the point of view of his own ethical system.

Beginning in 1881, for the sake of the education of the children, the Tolstoy family lived largely in Moscow. Tolstoy's religious views caused conflicts with his wife, who did not share his convictions. He strove to simplify his own life, did manual work, ceased to use alcohol and tobacco, and became a vegetarian. In 1891 he gave his wife the copyright of all his works written before 1881 and of *The Death of Ivan Ilyich;* other works written after 1881 became free to all. He also divided his property, valued at about $290,000, among his wife and children, henceforth living on charity in his wife's or his son's house. In 1892, despite his reluctance to use money, he conducted effective famine relief in central Russia. Becoming interested in the Dukhobors, peasant sectarians who refused military service, in 1899 he completed *Resurrection,* his last novel, in order to raise the funds that would help them leave Russia. Written partly in his earlier manner, it contains magnificent scenes, but at the close degenerates into propaganda. In 1901 the Russian Orthodox Church issued a notice denouncing Tolstoy as a false teacher, but he had become world-famous and had more readers than any other writer had ever reached during his lifetime.

During his last ten years Tolstoy wrote only short pieces. The friction which had existed between himself and his wife for some time now increased. On Nov. 11, 1910, he fled from home, accompanied only by his daughter Alexandra. He was stricken with illness on the train and paused at Astapovo, a small station, where he died on November 21. *See also* ANNA KARENINA; KREUTZER SONATA, THE; WAR AND PEACE. G. R. N.

**TOLTEC** [tɒ'ltɛk], a term generally used to refer to the great native American civilization that flourished in the Valley of Mexico between A.D. 500 and 1100. During this period the spectacular ceremonial site of Teotihuacán was constructed, a vast area 3½ mi. by 2 mi. in extent, and given over to pyramids and temples. Toltec means "master builder," or, in effect, "civilized," and the succeeding warring tribes of the Valley of Mexico, between A.D. 1100 and 1300 referred to themselves by this designation. The two periods are often differentiated as Classical Toltec (the earlier builders of Teotihuacán) and "New" or "Dynastic" Toltec (following the downfall of Teotihuacán). The later Toltecs reputedly had their capital at Tula, also in the Valley of Mexico. *See also* ARCHAEOLOGY (*Middle America*). G. R. W.

**TOLUCA** [tolu'kɑ], the capital of the state of Mexico, in the south central part of the Mexican republic. An important commercial and crafts center, it is famous for basketry, natural-color wool blankets, and embroidered garments. The public library, on the main plaza, contains many rare volumes, and the state museum has archaeological, colonial, and modern exhibits. Toluca was founded by Hernando Cortes in 1533. Pop. 1950, 52,968. S. G. I.

**TOMATILLO** [to'mɑti'yo], a smooth annual, *Physalis ixocarpa,* of the nightshade family, having bright yellow flowers spotted with brown in the center. This plant, sometimes called the strawberry tomato, has oblong, thin, notched or toothed leaves, which are borne on the erect (4 ft.), branching stem. The purplish berry, which is round and large, completely fills the purple-veined, husklike calyx. The tomatillo is often cultivated for its edible fruit; although a native of Mexico, it has been naturalized in the warmer parts of the United States. M. G. W.

**TOMATO,** a tropical herb, *Lycopersicon esculentum,* of the nightshade family native to South America. In its native habitat the tomato is a perennial; in temperate climates it is grown as an annual. The plant, 6 ft. or more in height, bears yellow flowers and red or yellow fruit usually flattened at the ends, with the sides grooved or furrowed. It was introduced from Africa into cultivation during the sixteenth century, but was grown only as a curiosity. In the middle of the nineteenth century there were decided improvements in the size and form of the fruit, and since that time plant breeders have developed hundreds of varieties from the original small, wrinkled, seedy fruit. Tomato seed is started under glass for the purpose of producing early fruit and prolonging the bearing season. Seedlings are transplanted to shallow boxes, and from these to the open ground. The plants should be set in rows 4 or 5 ft. apart to permit cultivation. In home gardens and in commercial plantings in some regions, tomato plants are pruned and tied to stakes or wire trellises. V. A. T.

**TOMATO WORM,** the common name of the larva of *Protoparce quinquemaculata,* a gray hawk moth with blackish and whitish linear markings and five pairs of yellow spots on the sides of the abdomen. It is closely related to the tobacco worm; it may also attack tobacco, as well as tomatoes and other related plants. The eggs are laid singly, and since the caterpillars feed on the new growth, an individual larva may greatly reduce the yield of a plant. When very numerous, they may destroy a whole field of plants in little more than a week. C. H. Cu.

**TOMBIGBEE RIVER** [tɒmbɪ'gbi], 409 mi. long, in Mississippi and Alabama. The headwater streams, the West Fork and East Fork, rise in Union and Prentiss counties, Miss., and flow southward to join in Monroe Co. to form the Tombigbee. The river flows generally southeast, receiving the Buttahatchie and Luxapalila rivers. South of Columbus, Miss., it crosses into western Alabama, where it is joined by the Sipsey, Noxubee, Black Warrior (the major tributary), and Sucarnoochee rivers. About 40 mi. north of Mobile Bay it joins the Alabama River to form Mobile River, flowing into Mobile Bay at Mobile. The river has been improved for small-boat navigation for 149 mi., as far as Columbus, Miss. Timber, cotton, sand, and gravel are transported on the Tombigbee. The river was important in the early history of the region. Hernando de Soto in 1540 discovered the Tombigbee, and prior to 1825 settlements were developed along it. Part of the Tombigbee River flows through the fertile Black Prairie region, a great cotton-growing area. J. E. F.

**TOM BROWN'S SCHOOL DAYS,** a novel by Thomas Hughes, published in 1857. The book is autobiographical, being based on Hughes's experiences at Rugby School under the famous headmaster, Dr. Thomas Arnold. It was largely responsible for popularizing Arnold's system of education, with emphasis on the character-building value of sports, the importance of religious ideals, and the leadership of the older boys. Later it came to be considered sentimental for its omission of coarser elements. A sequel, *Tom Brown at Oxford,* was published serially in 1859-1860. L. St.

**TOMCOD,** *Microgadus tomcod,* a small fish of the cod family, the Gadidae. It greatly resembles the cod but may be distinguished by the narrow, elongated ventral fin. Tomcod occur in North American coastal waters from Labrador to Virginia and often enter the mouths of rivers and estuaries. Maximum length is about 14 in. but most are only 9 to 12 in. Tomcod feed on crustaceans, mollusks, squid, and small fishes which they find on the bottom. The eggs, unlike those of its larger relatives, are heavy and sink to the bottom. Some of them are caught commercially and marketed as table fish. Fisherman angle for them from docks and bridges even in New York harbor. E. C. R.

**TOM JONES.** *See* History of Tom Jones, a Foundling, The.

**TOM SAWYER, THE ADVENTURES OF,** a novel, published in 1876, by Samuel Langhorne Clemens (Mark Twain). It has been long acclaimed a classic of boyhood adventure but is better remembered for its incidents than for its plot. Tom's ingenious method of getting his friends to whitewash his fence, his schoolboy misdemeanors, the scene in the graveyard at midnight when he and his boon companion, Huckleberry Finn, witness a brutal killing, certain episodes on the Mississippi River, and the wanderings of Tom and his sweetheart, Becky Thatcher, lost for several days in a cave, are all more sharply in focus than the plot of murder and detection on which the incidents are loosely strung. Critics sometimes decry the book as inferior to its sequel, *The Adventures of Huckleberry Finn* (1884), though they grant that it is superior to the even less skilfully devised *Tom Sawyer Abroad* (1894) and *Tom Sawyer, Detective* (1896), but boys of all ages continue to find it a favorite. L. L.

**TOMSK** [tɔ′msk], a region of the Russian Soviet Federated Socialist Republic, in the Soviet Union, and its chief city.

**The City.** The city is about 123 mi. northwest of Novosibirsk, at 56° 30′ N. lat., 85° 12′ E. long. It lies astride the mouth of the Ushaika River on the eastern bank of the Tom, 27 mi. above its confluence with the Ob. Founded in 1604, it remained a small trading village until gold was discovered nearby in 1824. Within seventy-five years it became the largest city in Siberia. Exhaustion of the gold deposits and construction of the Trans-Siberian Railway 54 mi. to the south caused the town to lose much of its importance. The university, founded in 1888, made Tomsk an intellectual center and was the only university in northern Asia until 1918. There are also schools of technology, chemistry, and medicine located in the city. Tomsk is on a branch line from the Trans-Siberian Railway, and it has a small river port. Trade is extensive in grain, cattle, butter, fish, and timber, and manufactures include flour, aircraft engines, metal products, and leather. Pop. (est. 1950), 175,000. C. C. H.

**The Region.** The region lies in the central part of the R.S.F.S.R. and is bounded on the north and northwest by the Khanty-Mansiisk National Okrug, on the east by the Krasnoyarsk Region, on the south by the Kemerovo and Novosibirsk regions, and on the west by the Omsk region. Its 121,351 sq. mi. lie in the southern part of the West Siberian Lowland and are drained by tributaries of the Ob River, including the Tom, Ket, Chulym, and Vasyugan rivers. Small groups of Khantes, Manses, and Nenetses fish and hunt in the thick forests of the north. Near the city of Tomsk the forests begin to give way to a steppe on which are concentrated the Russians and Ukrainians, who account for nine tenths of the population. The cultivation of wheat, potatoes, and sugar beets and the breeding of cattle are important. Pop. (est. 1954), 750,000. D. L.

**TOM-TOM,** an onomatopoetic term for primitive (especially Amerindian) drums or their imitations. Written *tam-tam,* the term denotes the Far Eastern gong used in European music. W. Li.

**TONALITY,** the impression of key made upon the ear by a piece of music. When the harmony student is told that he should establish his tonality, the meaning is that he should make clear, chiefly by dominant and tonic chords, what the key is, before modulating or using chromatic progressions. The key signature gives visible evidence of the key, but the listener needs further assistance. Similarly, when tonality is said to be vague, the meaning may be that rival keys are asserting their claims, as in the exposition of a fugue, where the dominant key occurs as often as the tonic; or the meaning may be that no tonal center has been definitely "established."

Bitonality, as applied to twentieth century music, means the employment of two keys simultaneously, rather than the recognition by the ear of two keys, although such recognition is often possible. Polytonality, the use of more than two keys at once, is, from the listener's viewpoint, little different from atonality, the abolition of any tonal center. J. M. Ba.

**TONAWANDA** [tɒnəwɒ′ndə], a lake port city in western New York, in Erie Co., situated on the Niagara River, at the western terminus of the New York State Barge Canal, 9½ mi. north of Buffalo. The Erie and Iroquois Indians had precolonial settlements on the site. The first white settlers arrived in 1808, and the town of Tonawanda was formed in 1836 by the state legislature. Incorporated as a city in 1903. Tonawanda is governed by a mayor and city council. In its early days the community was considered one of the largest lumber centers in the country. Tonawanda's harbor is second in the state of the lake ports in the receipt of goods but not second in shipping. Abundant hydroelectric power for manufacturing is supplied by Niagara Falls; and Tonawanda and North Tonawanda, across the canal, form one industrial community. The city's leading manufactures are fiber, office equipment, steel, chains, paper, abrasives, paints, and roofing materials. Transportation is furnished by lake, canal, and river craft and by the International and the New York Central railroads. Pop. 1950, 14,617.

**TONE,** a term in music which has several meanings. In general it refers to a single sound of distinguishable pitch and definite duration, as opposed to noise and to a sequence of tones indistinguishable in pitch, such as a trombone "smear." Tones are thus the basic element in all music, although noise plays a minor role through rattles, clappers, and numerous other instruments of indefinite pitch. The British term for tone in this sense is "note."

In Great Britain and the United States the interval of a major second is also called a "tone" or "whole tone," while a minor second is a "semitone." In a third nontechnical sense, "tone" is musical sound in general, as in "tone poem," and "tone color." In Gregorian chant, a tone is one of a number of standard melodic formulae, to which psalms and other liturgical texts are sung. W. Li.

**TONE POEM.** *See* Symphonic Poem.

**TONGA.** *See* African Peoples.

**TONGA, or FRIENDLY, ISLANDS** [tɒ′ŋgə], a cluster of about 180 small tropical islands and islets in the south Pacific Ocean at 20° S. lat., and 175° W. long., east of the Fiji Islands, ethnographically included in Polynesia. The islands are dispersed through about 200 mi. of ocean, and have a total land area of approximately 250 sq. mi. They are divided into three main groups: Tongatabu, Vavau, and Haabai, with Niuafoo and Niuatobutabu isolated toward the north. The largest and most important island is Tongatabu, which occupies more than half the total land area of the cluster, and on which is located the capital, Nukualofa. The average annual temperature ranges from 73° F. to 76° F.; the average annual rainfall is from 78 to 88 in. Most of the inhabitants are engaged in agriculture. The principal export is copra, but bananas, citrus fruits, pineapples, yams, and other subsistence crops are grown in addition to coconuts. The islands were discovered by Dutch navigators in 1616 and visited by Abel Tasman in 1643 and by Captain Cook in 1773 and 1777. The present royal dynasty took power in 1845 and survived the assumption of British protection in 1900; it is the only remaining Polynesian kingdom. The courts of Tonga have jurisdiction over all but the more serious crimes of non native residents. The legislative function is in the hands of a parliament of 22 members comprising a speaker and three equal groups, one group named by the British Crown, one elected by the islands' nobility, and one elected by the commoners of Tonga. Pop., about 50,000. R. G. B.

**TONGUE.** *See* COMPARATIVE ANATOMY; SENSATION.

**TONGUE WORMS,** endoparasitic, blood-sucking forms of the class Pentastomida, in the phylum Arthropoda. They are closely related to the Acarina, the mites, a fact based on the mitelike appearance of the larva. The life cycle involves two hosts. In the family Porocephalidae (e.g. *Armillifer armilliatus* and *A. moniliformis*), the screw-shaped adults live in the lungs of reptiles, while the larvae inhabit the internal organs of a variety of vertebrates, including man. In the family Linguatulidae (e.g. *Linguatula serrata*), the tongue-shaped adults live in the nasal passages of dogs and cats. The larvae live in the organs of man and other mammals; these mammals, therefore, are the intermediate hosts and are infected by the ingestion of eggs that are in the soil. The eggs develop into larvae, which migrate to the organs and there encapsulate. The infective stage is called the nymph and it leaves the body only at the death of the intermediate host. These are then picked up by the definitive hosts, cat and dog. R. F. N.

**TONKA BEAN** [tɒ′ŋkə], a large tree, *Dipteryx odorata,* 60 to 80 ft. high, which is a member of the pea family and a native of Guiana. This tree bears an almondlike fruit which contains a long seed covered with a shiny black skin. The seed is known as the tonka bean and has an odor, due to the presence of coumarin, resembling that of new-mown hay. It is widely used in the manufacture of perfumes. M. G. W.

**TONKIN or TONKING** [tɒ′nkɪ′n, tɒ′ŋkɪ′ŋ], a former French protectorate in Indochina which in 1949 became a province, with the name of North Vietnam, of the new state of Vietnam. It has an area of 44,672 sq. mi. and consists of the valley and delta of the Yuan Kiang or Red River. It is bounded on the north by China, on the east by the Gulf of Tonkin, on the south by Annam and Laos, and on the west by Laos.

**Geography.** Mountainous areas border the alluvial plain of the Red River on three sides. The river, rising in China's Yünnan Province, crosses the territory from northwest to southeast and is joined above Hanoi by two important tributaries, the Claire River, and the Noire or Black River. A parallel mountain range traversing a large part of Tonkin separates the valleys of the Red and Black rivers. The soil in the valleys and delta is very fertile and is particularly suitable for rice production. Tonkin's climate is subtropical, with fairly cool weather in the winter and a short dry period.

**Ethnology and Population.** Tonkin had a population of 9,920,000 in 1942. Because of unsettled conditions and almost continuous warfare in the area since that date, its present population can only be conjectured. The population is very dense in the Red River delta area, reaching as high as 6,000 persons per square mile of cultivated area. The great majority of the inhabitants are Annamese, who are a mixture of the indigenous Indonesians and the Mongolian tribes originating in Tibet or southwestern China, with the addition of considerable Chinese blood. In the mountains are found a number of Thais and Indonesians. There are about 40,000 Chinese and about 20,000 Eurasians in Tonkin. Hanoi and Haiphong, which together form a major port, had a combined population of more than 343,000 in 1951. Buddhism, influenced by Confucianism and Taoism, is the predominant religion in Tonkin.

**Economic Life.** Rice is the major crop in Tonkin, production in 1944 having totaled 1,696,000 tons. Other products are corn, arrowroot, sugar cane, tea, fruits, tobacco, and raw silk. Tin, iron, and coal are mined, the latter two providing the territory's chief exports. There also are limestone quarries and deposits of calamine. These, with the presence of numerous rivers suitable for the production of hydroelectric power, provide the area with the potentialities of modern industrial development.

**History.** After 1,200 years of domination, the Annamese people threw off the Chinese yoke in A.D. 931. Thereafter, Tonkin was an independent state until 1802, when it became a province of Annam. In the latter part of the nineteenth century the French, desiring to obtain a means of access into southern China, were attracted to the Red River valley. They met considerable resistance, but by treaties in 1884 and 1885 with Tu Duc, the emperor of Annam, they acquired a protectorate over Tonkin, and in 1886 the territory was made a member of the French Indochinese Union. In 1897 the viceroyalty maintained in Tonkin by the emperor of Annam was superseded by a French residency administration.

Under this system, Tonkin was divided into twenty-three provinces, each administered by a resident under the general direction of a resident superior, assisted by an advisory council; he was responsible to the governor general of the French Indochinese Union. A native administration, subordinate to the French, was maintained.

During World War II, Tonkin, with the rest of Indochina, was occupied by the Japanese. At the time of the Japanese surrender, Tonkin fell under the control of the Viet Minh, the popular name for a revolutionary movement that had been developing for a number of years under the leadership of the Communist Ho Chi Minh, who in 1945 proclaimed the Democratic Republic of Vietnam, claiming jurisdiction over Tonkin, Annam, and Cochin China.

Negotiations between France and Ho Chi Minh, which for a while looked as though they might succeed, broke down in the latter part of 1946 and Tonkin became the center of bitter fighting between French and Viet Minh forces. The French reoccupied Hanoi and the Viet Minh forces

took to the mountains surrounding the Red River delta and valley. In 1949 Tonkin officially became the northern province of Vietnam under Chief of State Bao Dai. At the end of hostilities in July 1954, French Union forces still held Hanoi and much of the Red River Delta, but by the terms of the Geneva truce, all Vietnam north of parallel 17° N. was assigned to the Viet Minh pending a general election to be held in 1956; Tonkin thus became subject to the Viet Minh during that period. *See also* INDONESIA; VIETNAM.

A. V.

**TONLE SAP** [tɒ′nle sæ′p], a large lake in central Cambodia, Indochina. It is about 81 mi. long from northwest to southeast and is connected with the lower Mekong River by a canal and a small river. The lake acts as a reservoir for flood water from the Mekong during the summer wet season. The river backs up and flows into Tonle Sap, which expands to cover an area of about 2,300 sq. mi. and reaches a depth of about 30 ft. During the drier season in the winter Tonle Sap is reduced to about 518 sq. mi., the river reversing direction and draining the lake. During this period the lake resembles a large swamp, and even sampans have difficulty in crossing it because of mud. As the water recedes, it leaves a sediment which insures a rich rice crop, thus making the lake economically important. Fish are caught in large quantities.

J. E. F.

**TONO-BUNGAY** [to′no bʌ′ŋge], a humorously satiric novel by H. G. Wells, first published in 1909. The story is basically the history of the rise and final failure of a gigantic business based on the manufacture and sale of Tono-Bungay, a patent medicine, that brought for a time wealth, influence, respect, and the confidence of endless people to its inventor, Edward Ponderevo, and his nephew George. In the book Wells devotes considerable space to exposing certain sharp and dishonest practices then prevalent in the commercial and advertising fields.

N. MacM.

**TONSIL,** or palatine tonsil, one of a pair of oval masses of lymphoid tissue which lie in a depression between the soft palate and the tongue. The palatine tonsils, along with the pharyngeal tonsils or adenoids located in the roof of the pharynx, and the lingual tonsils located in the base of the tongue, form the tonsillar ring. The tonsils are not known to have any definite function, but their enlargement interferes seriously with breathing. *See also* RESPIRATORY DISEASES (*The Throat*).

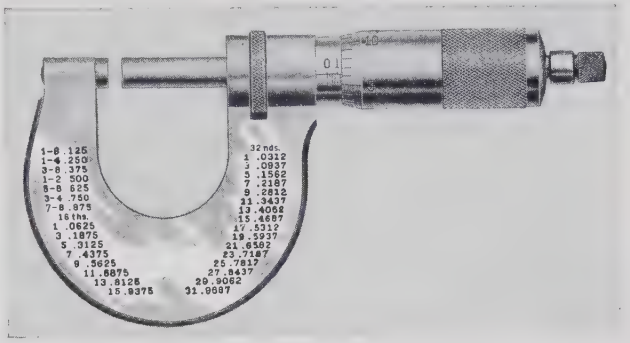
C. R. No.

**TONTO.** *See* INDIAN TRIBES, NORTH AMERICAN (*Southwest*).

**TOOELE** [tʊe′lɛ], a city in northern Utah, the county seat of Tooele Co., 24 mi. southwest of Salt Lake City. Tooele was founded in 1849 and incorporated in 1853; it has the council-manager form of government. The smelting of the lead, copper, and gold mined in the district is the city's leading industry. There are large salt deposits in the region. Scenic features include Great Salt Lake, about 10 mi. north, and Great Salt Lake Desert, about 45 mi. west. Pop. 1950, 7,269.

**TOOLS, GAUGING,** special devices employed for accurate measurements. Among such devices are: calipers, depth gauges, taper and thickness gauges, dial and surface gauges, spirit levels and plumb bobs, and straightedges and squares.

**Calipers and Depth Gauges.** There are certain commonly measured dimensions to which simple rules and scales are not applicable, such as diameters of cylinders, and diameters and depths of holes. Plain calipers and depth gauges may be set the size of the diameter or depth of hole and the "set" distance then measured by rule or scale. For greater accuracy in making such a measurement, direct-reading calipers of both the micrometer and vernier types are used. The micrometer principle is based on the great accuracy of a fine screw-thread. Reading a micrometer is a matter of counting the revolutions and fractions of revolutions of



COURTESY OF L. S. STARRETT CO.

*MICROMETER CALIPER*

*The setting shown is read as follows: 0.1 + 0.025 + 0.006 (approx.) = 0.131 (approx.). (Note: Gap between edges of caliper is less than this reading because of photographic reduction.)*

a thimble, as measured from a zero position. Whole revolutions are indicated by marks along the stationary sleeve, and partial revolutions by the graduations around the periphery of the rotating thimble. The screw that is used in most micrometers has 40 threads per inch and the thimble has 25 divisions around it, so that each division on the thimble represents one one-thousandth of an inch of motion of the spindle.

The vernier caliper is arranged to measure diameters directly in thousandths of inches. The main stationary scale has 50 graduations per inch, whereas the vernier has a total of 20 graduations. The 20 equal divisions of the vernier scale have the same total length as 19 of the divisions on the main scale. Thus, whenever the zero mark of the vernier stops between marks on the main scale, there can be only one of the vernier marks exactly opposite a mark on the main scale, and the number of this mark gives the number of twentieths by which the zero of the vernier scale has advanced from one main scale mark toward the next. The diameters may thus be read in thousandths of an inch.

**Taper and Thickness Gauges.** When very small distances are to be measured, of the order of a few thicknesses of paper, taper and thickness gauges are often used. The thickness gauge is used on a "go" and "no-go" basis. Different leaves of the thickness gauge are tried successively in the gap until one is found that will just slip into the gap, whereas the next one, greater by one thousandth of an inch, will not go into the gap. The taper gauge is utilized by slipping it into the gap and then sliding it toward the thicker end. By this means, the thickness of the taper at the point where it just enters the gap may then be read on the face of the taper gauge.

**Dial and Surface Gauges.** It is often important to know the amount of eccentricity of a supposedly true or concentric rotating shaft. The dial and surface gauges are used for this purpose. The dial gauge is supported with the plunger resting on the surface of the shaft to be tested. As the shaft is rotated, the plunger, pressed against the shaft

with a spring, rises or falls as the shaft wobbles. The motion of the plunger is multiplied by a lever system in the gauge and rotates a hand past a fixed dial. Dial gauges are made to indicate thousandths and ten-thousandths of inches.

**Spirit Levels and Plumb Bobs.** In building structures and setting up machinery, it is customary to set the main axes or planes parallel with the direction of the force of gravity or perpendicular thereto. The two devices ordinarily used to determine such parallelism are the spirit level and the plumb bob.

The plumb bob consists of a heavy weight suspended on a string. By suspending the plumb bob near to any supposed vertical number of a structure, the direction of the edge of the structure can be compared visually relative to the string. The accuracy of this method depends on the symmetry of the weight with respect to its point of attachment to the string.

The spirit level consists of a straightedge upon which a level vial is mounted. The level vial is a sealed glass tube a few inches long, filled with alcohol and containing a single bubble of air or other gas. When the vial is horizontal, this bubble finds a marked position on the tube. Thus, the straightedge may be laid on a workpiece and the latter adjusted until the level bubble is centered. By placing the level vial with its axis perpendicular to the straightedge, the straightedge may be used for checking vertical workpieces.

**Straightedges and Squares.** The laying out of work is customarily done with straightedges and squares. The majority of squares have angles of 90 deg. between the blades and the handles, although miter squares have 45 deg. angles. When angles other than these standard values are to be used, bevel protractors or bevels are used, in which the angle of the square is adjustable. *See also* MACHINE TOOLS.

E. D. H.

**TOOTHED HERRING.** *See* MOONEYE.

**TOOTHWORT,** common name of a genus, *Dentaria,* of small perennial herbs, growing to about 1½ ft. tall, of the mustard family. Among the best-known species are the milkmaids or western toothwort, *D. integrifolia,* native to the Pacific coast; the cut-leaved toothwort, *D. laciniata;* and the two-leaved toothwort, *D. diphylla,* which is also called crinkleroot and was used for food by the Iroquois and other Indian tribes. The flowers of these herbs are borne in small clusters and are white, purple, or rose-colored; the leaves are palmately divided, and the rootstocks are fleshy and horizontal. In Great Britain, a plant of the broomrape family, *Lathraea squamaria,* is known as toothwort. It is leafless, has rose-colored flowers, and is parasitic on the roots of trees.

M. G. W.

**TOOWOOMBA** [təwʊ′mbə], a city in the southeastern part of Queensland, eastern Australia, situated at 27° 44′ S. lat. and 152° 0′ E. long. in Aubengy Co. It is about 70 mi. west of Brisbane and is in Craig's Range, which has an elevation of 2,000-3,000 ft. above sea level. It is also within the Australian humid subtropical belt, but its climate is modified by elevation.

Toowoomba is known as "The Garden City of Queensland," but it is also an industrial center, with lumber and steel mills, soap factories, and tanning and leather industries. It has long been famous as a summer resort. The city was chartered as a municipality in 1860 and is an important railway terminus. It has many parks, churches, and fine buildings, and is the seat of the Christian Brothers College. Pop. 1947, 33,326.

J. E. F.

**TOPAZ** [to′pæz], a mineral with both gem and industrial uses. It is an aluminum fluosilicate, $Al_2SiO_4(F,OH)_2$. Topaz occurs either in well developed prismatic orthorhombic crystals or in large formless masses. It has a hardness of 8, and one direction (basal) of perfect cleavage. Topaz is typically associated with granite or its volcanic equivalent, rhyolite. It occurs in granite pegmatites and in cavities in rhyolite. It is also found as an abundant gangue mineral in tin-bearing high-temperature hydrothermal veins. In addition to its use as a precious stone, topaz is mined and used as a substitute for fluorspar in steel making and for leadless glazes in ceramics. It also has possibilities as a substitute for kyanite in refractories. Commercial deposits of massive topaz have been developed near Kershaw, S. C., and in Gunnison Co., Colo.

Pale yellow to yellow-brown or blue are colors usually associated with gem topaz. However, colorless, green and sometimes pink topaz is found in nature. Yellow topaz from Brazil, subjected to heat, turns pink upon cooling. Not all yellow topaz is so affected by heat, however, and some even loses its color upon being subjected to sunlight for any length of time. Precious topaz of fine quality is a relatively rare mineral. The confusion which exists between the heat-treated mineral known as "topaz-quartz" and precious topaz is discussed under quartz. Occasionally, very large crystals of precious topaz weighing several pounds have been found in the Minas Gerais province of Brazil. Both the Ural and Ilmen mountains produce fine topaz. Ceylon, Burma, Japan, Madagascar, New South Wales, and Germany are other sources of the mineral.

In commerce, topaz has suffered under a variety of confusing prefixes and terms: "Oriental," "Occidental," "Spanish," "Brazilian," "Indian," to name a few. Unfortunately some of these names are applied to yellow sapphire or yellow quartz, both inferior gems which have been called some form of topaz so that higher prices can be asked.

A synthetic spinel is now marketed which has the identical hue of precious blue topaz. By use of a special absorption filter, the "blue" of the synthetic turns red, disclosing the imitation from the real. Other physical characteristics further aid in making differentiation possible.

**TOPE.** *See* STUPA.

**TOPEKA** [topi′kə], the capital city of Kansas, the county seat of Shawnee Co., in the northeastern part of the state, about 60 mi. west of Kansas City. In their search for gold in the sixteenth century the Spanish explorers visited the region, but it was not until the California gold rush that there was continuous white settlement in the area. In 1854 the Federal Government opened up the territory for settlement, and in December of that year the site of Topeka was staked off. The first settlers were antislavery men, and the community, which was incorporated in 1857, became the center for the free-soil legislation. In 1855 the famous Topeka Constitution was framed. When Kansas was admitted to the Union as a state in 1861, Topeka became the capital. In 1863 it was the starting point for the construction of the railroad which was to become the Atchison, Topeka and Santa Fe. This line has continuously maintained in Topeka its main offices, largest railroad shops, and a hospital for its employees.

The city's educational institutions include the Washburn Municipal University, Kansas Vocational School for Negroes, and State Industrial School for Boys. Located in Topeka are Menninger Foundation, the noted psychiatric clinic, and a

state hospital for the insane. Cultural and recreational facilities are found at the Mulvane Art Museum, the state historical society museum, the municipal auditorium, Gage Park with the Reinisch Rose and Rock Garden, Lake Shawnee Park with a 400-acre lake, and the Kansas Free Fair Grounds.

In addition to the Santa Fe, transportation facilities are provided by the Chicago, Rock Island & Pacific, Missouri Pacific, and Union Pacific railroads, and by the Braniff, Continental, and Trans World air lines. The city's location between the corn belt and cattle-breeding districts of the Southwest and the winter-wheat fields and chief markets of the country has made Topeka an important shipping and distribution point. Agriculture is the basis for the city's main industries: the processing and packing of meat and food products and flour milling. Railroading, printing and publishing, and metal working are also important, and the output of the other varied industries include tires, lime, steel, medicines, and serums. Pop. 1950, 78,791. S. D. M.

**TOPOLOGY** [topɒ'ləji], that branch of geometry which investigates the form and position of geometrical objects. It is sometimes called analysis situs (analysis of situation) or point-set theory. Here the phrase "form and position" is used in its widest sense and carries no implication of metric or measurable properties. Thus topology is qualitative and descriptive. It is popularly called "rubber-sheet" geometry since it ignores changes that are caused by continuous distortion and stretching.

There are three main branches of topology: point-set theoretic, algebraic, and mapping. Though some of the concepts are of earlier origin, it is safe to make the general statement that these fields were initiated by Georg Cantor (1845-1918), Henri Poincaré (1854-1912), and L. E. J. Brouwer (1882- ). Tremendous changes in mathematical thought and technique have taken place since the appearance of Cantor's first paper on set theory and have led to investigations of the foundations of logic and mathematics.

**Closed, Open, and Connected Sets.** By a neighborhood of a point in space is meant the set of all points interior to a sphere with the given point as center. If $A$ is a subset of space (for example the set of points lying inside a cube), then a point $P$ is a limit point of $A$ if every neighborhood of $P$ contains a point of $A$. Thus, the boundary points of the cube are limit points of the interior points. If $P$ is a point distinct from the point $Q$, then $P$ is not a limit point of the set consisting of $Q$ alone. A set is said to be closed if it contains all of its limit points. Thus, a line is a closed set. A set is said to be open if it contains at least one neighborhood of each of its points. A line is not an open set, but the set of all points not lying on a given line is an open set. A set is said to be connected if, no matter how it is decomposed into two sets (each containing at least one point), one of these sets contains a limit point of the other. A plane is connected, but the set consisting of two parallel planes is not connected. Entirely analogous definitions may be phrased in the plane if, in the definition of "neighborhood," the word "sphere" is replaced by "circle."

Let $A$ and $B$ be two subsets of space. If to each point $P$ of $A$ there is assigned a point $Q$ of $B$ in a continuous way (or, expressed technically, so that limit points are preserved), then the assignment is called a map or a continuous correspondence. If also each point $Q$ of $B$ is assigned from one and only one point $P$ of $A$ and, further, if the reversal of this assignment is a map, then the sets $A$ and $B$ are said to be homeomorphic or topologically equivalent, and the map is called a homeomorphism. Topology is the study of properties left unchanged by homeomorphisms. Thus a sphere together with its interior is not to be distinguished topologically from a cube together with its interior. But a line and a plane are topologically distinct.

By a simple closed curve is meant a set homeomorphic with a circle (the periphery only). The Jordan closed-curve theorem states that a simple closed curve in the plane divides the plane into two sets which are open and connected, and that each point on the curve is a limit point of the two sets. Despite the deceptive simplicity of this result, its proof is by no means simple. A proposition of this sort is in the domain of point-set theoretic topology. Proofs, however, may be given by both algebraic and mapping theoretic means. The theorem can be extended to simple closed surfaces in space and, also, even to very irregular surfaces and curves. The statements of some of these generalizations can be given only in algebraic terms.

Let $A$ denote a sphere together with its interior. Then the Brouwer fixed-point theorem asserts that any map of $A$ into itself leaves at least one point fixed. This result is perhaps the most frequently applied theorem in other branches of mathematics.

Let $P$ denote some definite point of a connected set $A$ in space. A generic closed curve containing $P$ and lying in $A$ will be denoted by $C$. Each such curve is assigned a definite but arbitrary orientation or sense of traversal. The curves considered are not necessarily simple and so may have self-intersections, as a figure 8 curve. The product, $C \cdot C'$, of two curves $C$ and $C'$, is the curve obtained by first traversing $C'$ and then $C$. For each curve $C$ one writes $C^{-1}$ for the same curve as $C$ but with the opposite orientation. Two curves are said to be equivalent if it is possible to deform one into the other without leaving the set $A$, keeping the point $P$ fixed at all times. With the use of this multiplication, and the inverse, it is possible to regard the classes of equivalent curves as forming a group. With suitable hypotheses on the set $A$ it may be shown that any set homeomorphic with $A$ has the same group. The circle (periphery only) has for its group essentially the group of integers, and hence likewise does any simple closed curve. The group of the figure 8 curve is quite complicated, but the group of the line is simple, containing only the neutral element.

**Four-Color Problem.** One of the most interesting and still unsolved problems of topology is the four-color problem. It amounts merely to the question: Can any map be colored with four colors so that areas having a common boundary may have different colors? It is admissible, for example, to color Utah and New Mexico both blue and Colorado and Arizona both green since the common boundary of these states is a point. That this is a problem in topology is quite clear, since area has no bearing in the matter and the fact that a boundary line is straight or curved is of no importance. It may be shown that five colors suffice to color any map.

**One-sided Surface.** An interesting and instructive example is that of a one-sided surface. The simplest such surface may be constructed as follows: Let $ABCD$ denote the vertices of a rectangle (for convenience longer in the direction $BC$ than in the direction $AB$) named in clockwise direction. Give the rectangle a half twist and join the edges $AB$ and $CD$ so that $C$ falls on $A$ and $D$ on $B$. The surface thus obtained is called a Möbius band and is topologically distinct from the surface obtained by joining $AB$ and $CD$ without making a twist. A. D. W.

**TOPONYMY.** *See* PLACE NAMES.

**TOPSY,** a young Negro girl in Harriet Beecher Stowe's *Uncle Tom's Cabin* (1852). When questioned about her family, Topsy says: "Never was born, never had no father, nor mother, nor nothin' . . . I 'spect I growed." L. L.

**TORADJA.** *See* Indonesian Peoples (*Principal Peoples*).

**TORAH** [to′rɑ], a Hebrew word meaning "law" or "teaching." The term is primarily applied to the Pentateuch or Five Books of Moses, but sometimes to the entire body of Jewish law or to the entire Bible. *See also* Bible; Old Testament; Oral Law; Pentateuch; Talmud; *and individual articles on books of the Pentateuch.* D. G.

**TORDESILLAS, ANTONIO DE HERRERA Y.** *See* Herrera y Tordesillas, Antonio de.

**TORGAU** [tɔ′rgau], a town in the former Prussian province of Saxony, in eastern Germany, 31 mi. northeast of Leipzig, on the Elbe River. A tenth-century fortress town, it later belonged to the margraves of Meissen, then passed to Saxony. The Torgau articles were drawn up there by Martin Luther and his fellow Protestants. In 1760 Frederick the Great won a bloody victory over the Austrians in Torgau. The town became famous on Apr. 22, 1945, when American and Soviet troops joined forces at the Elbe and so split Germany north and south in the last days of World War II. By prior arrangement, American forces stopped at the Elbe-Mulde rivers and waited for the Russians to drive westward, while a small advance party entered Torgau to make the junction. At the conclusion of the war the town was included in the zone occupied by the Soviet Union. Pop. (est. 1938), 15,300. C. C. H.

**TORNEÄLVEN** or **TORNE RIVER** [to′rnəælv, to′rnə], in northern Sweden, a part of the boundary between that country and Finland to the east. Rising at the southeastern extremity of Lake Torneträsk in the Kjölen Mountains near the Norwegian border, the Torne flows southeast for about 130 mi. to a point below Pajala, where the Muonio joins it. Here the Torne turns south for about 125 mi., widening considerably and becoming less swift, to flow into the Gulf of Bothnia at the twin ports of Haparanda, Sweden, and Tornio, Finland. It drains 15,400 sq. mi.—9,650 in Sweden and 5,750 in Finland. Its main tributaries are the Rautasjoki, on the right bank, and the Lainio and the Muonio, on the left. The Muonio from its confluence with the Torne forms the international boundary extending northward for about 175 mi. to its headwaters at Lake Kilpisjärvi, where Norway, Sweden, and Finland meet. Besides Haparanda and Tornio, the only river towns having a population of more than 1,000 in 1947 were Kiruna, Vittangi, and Pajala. As a boundary river, the Torne is of considerable strategic importance, but it has little value for navigation. J. E. V.

**TORONTO** [tərɒ′nto], the capital and largest city of Ontario, and second largest city in Canada, situated on the northwestern shore of Lake Ontario, 230 mi. southwest of Ottawa, and 228 mi. northeast of Detroit, Mich. Its harbor is one of the most important on the Great Lakes. Toronto is the focal point of the Ontario provincial highway system and is connected with Niagara Falls and Buffalo, N.Y., by the Queen Elizabeth Way. Transportation facilities are provided by the main lines and branches of the Canadian National and Canadian Pacific railroads, several steamship lines, and the American and Trans-Canada airlines.

**Physical Features.** The site of Toronto is determined by the presence of the harbor, a natural bay about 2 sq. mi. in area, protected from the open water of Lake Ontario by a curved sand bar about 4 mi. long known as Toronto Islands. Entrance to the harbor is through concrete line canals at both the eastern and western extremities. On the island are many summer cottages, parks, playgrounds, and an airport.

The city is built on a gently sloping plain which rises from the water's edge, which is 245 ft. above sea level, to a height of more than 600 ft. in the northern part of the city. The area within the city limits is about 35 sq. mi. The Humber River flows through the western part of the city, and the Don River flows through the eastern part. Both rivers and their tributaries flow in deep valleys, interrupting the rectangular street pattern and requiring a great number of bridges.

**History.** Toronto is a word of Huron origin signifying place of meeting. The area was visited by Etienne Brulé in 1615. A French trading post was established in 1720 but was abandoned in 1730. In 1750 a French trading post, Fort Rouillé, was founded, which in turn was abandoned in 1759 after the evacuation of the territory by the French. Under Governor John G. Simco the site was selected as the capital of Upper Canada in 1793 and the transfer of administration from Newark (Niagara-on-the-Lake) began in the summer of that year, continuing until 1796. A town was laid out in 1793 and called York. During the War of 1812 the government buildings were burned by invading United States forces. Incorporated as a town in 1817, the community became the city of Toronto in 1834 with a population of 9,254. Growing steadily after 1835, metropolitan Toronto had a population in 1951 of 1,117,470.

**Government.** The city is governed by a mayor, four controllers, and eighteen aldermen elected annually. The board of education is elected yearly, and the police, street, railway, hydroelectric services, and the harbor are administered by appointed commissions.

**Institutions and Buildings.** Toronto has many educational foundations, including both technical and commercial institutions, private schools, and colleges. The University of Toronto, located on a beautiful campus adjacent to Queen's Park, is the largest university in Canada. Affiliated with the University and also located in Toronto are Knox, Wycliffe, Trinity, and Emmanuel Theological colleges, the Ontario College of Pharmacy, the Ontario College of Art, and the Royal Conservatory of Music. Toronto is a noted medical center with ten large hospitals in 1947, the University of Toronto School of Hygiene, Connaught Laboratories, and Banting Institute.

The Royal Ontario Museum has collections in geology, zoology, and anthropology, and the most complete collections of Chinese art in North America. The Grange houses the Toronto Art Gallery, which has an extensive collection of Canadian art. The city has numerous beautiful churches and is the see of an Anglican and a Roman Catholic archbishop. Massey Hall and Maple Leaf Gardens are two large auditoriums. In 1952 Toronto claimed the largest hotel in the British domain, the Royal York, and the highest building in the Empire, the Canadian Bank of Commerce.

Of interest are the Canadian National Exhibition held near the site of Fort Rouillé every September and the annual No-

COURTESY OF CANADIAN NATIONAL RAILWAYS

*SKYLINE OF TORONTO ALONG LAKE ONTARIO*

vember Royal Winter Fair, at which are exhibited the best of Canada's livestock and agricultural products.

**Parks.** The park system, playgrounds, and squares in 1952 comprised 2,309 acres. Among the more notable are Queen's Park, covering 40 acres in the center of the city and containing the provincial parliament buildings; Riverdale Park with the zoo in the Don Valley; High Park in the western section of the city, a large natural area which has a small zoo and a pioneer exhibit housed in Colborne Lodge; and Exhibition Park, containing 350 acres, on the lake shore west of the harbor.

**Economic Activities.** Toronto is a busy commercial, industrial, and residential city. In 1952 it was the headquarters of four of the ten chartered banks in Canada. The Toronto Stock Exchange is the greatest market for mining shares in the world. As an industrial center, Toronto is second to Montreal in the Dominion. The rapid increase in industry in the area has necessitated the building of steam generated electric stations to augment the supply from Niagara. The chief products include foods and beverages, iron and steel products, clothing, chemical and allied products, and electrical apparatus and supplies. The city is one of the chief livestock markets in Canada, and through its port is shipped most of the meat sent to Great Britain. The city is considered Canada's publishing center. Pop. 1951, Greater Toronto, 1,117,470; Toronto proper, 675,754. D. F. P.

**TORONTO, UNIVERSITY OF,** the provincial university of Ontario, Canada. The nucleus of the university was King's College, a Church of England institution chartered in 1827 but not established until 1843. In 1850 it was reorganized and completely secularized. The university has faculties of arts, medicine, applied science and engineering, household science, education, forestry, music, graduate studies, and dentistry. There are schools of law, architecture, physical and health education, social work, nursing, hygiene, and Chinese studies, and institutes of child study and business administration. In the faculty of medicine is the Banting and Best Medical Research Department, commonly known as the Banting Institute. The Connaught Medical Research Laboratories are associated with the school of hygiene. The Royal Ontario Museum has become a part of the university, and the Royal Conservatory of Music is under university control.

COURTESY OF THE NATIONAL FILM BOARD OF CANADA

*Hart House, social center for men of the University of Toronto*

University College, which grew out of King's College, was founded in 1853. Other arts colleges in federation with the university, with the respective dates of founding and federation are: Victoria University, 1830 and 1890; University of Trinity College, 1851 and 1904; and St. Michael's College, 1852 and 1890. Closely connected with this last is the Pontifical Institute of Mediaeval Studies. Theology, as well as the arts, is taught in each of these three institutions. The theological faculty of Victoria University, known as Emmanuel College, operates under the United Church of Canada. Trinity and St. Michael's are respectively Anglican and Roman Catholic. Knox College (Presbyterian) and Wycliffe College (Anglican), which teach theology only, are also federated with the university. The various arts colleges limit their teaching to the humanities, principally languages, the university being responsible for the teaching of the natural and some of the social sciences. Other colleges in affiliation with the university are: Ontario Agricultural College and Ontario Veterinary College in Guelph; Ontario College of Pharmacy and Ontario College of Art in Toronto; and Albert College, Belleville. The Department of University Extension was organized in 1920. It conducts a summer school and evening courses leading to the B.A. degree. In the academic year 1949-1950 this department had an enrollment of over 10,000, of whom 1,195 were credit students. The enrollment in the regular full-time courses was 14,141.

The libraries of the university and its federated colleges in Toronto contain over 735,000 volumes. J. J. T.

**TORPEDO,** electric rays of the family Torpedinidae, having broad, disklike bodies and short, thick tails. A number of species are found, mostly near the shores in the warm seas. The electric organs, derived from muscular tissue, occupy an area at the base of both pectoral fins. Many hexagonal tubes filled with a gelatinous substance are divided into compartments each forming an electroplax. A main

nerve connects a special lobe of the brain with the small nerves of each plate. The torpedo uses its electric charge for protection and to stun or kill its prey. The shock of a large specimen can knock down a man. Repeated use weakens the shock although 150 shocks per second may be produced. The larger species range from 3 to 6 ft. long and weigh 200 lb. It lives sluggishly in the sand, sometimes partially buried. Young are born alive. E. C. R.

**TORPEDO,** a small, crewless undersea craft, self-propelled and self-steered in both azimuth and depth, carrying an explosive charge that is arranged to detonate in contact with, or in a certain proximity to, its target.

Until the latter part of the nineteenth century, the term torpedo seems to have been applied to any explosive charge, complete with detonating feature. It was prepared in advance and transported to the site of its intended use, where it might be hidden either on land or under water, or otherwise transported or propelled to explode upon contact with a solid object. The torpedoes damned by Farragut at Mobile Bay were such charges, encased in iron and strapped to the tops of submerged piles or, if buoyant, moored below the surface. They were usually detonated when contacted by a vessel, although sometimes they were fired, electrically or otherwise, from the shore. Such weapons would now be called mines.

In 1855, an inventor named White proposed to the United States Navy a small engine-driven boat with apparatus (not delineated) to steer a straight course to an enemy vessel, the boat to carry an explosive charge intended to be detonated on contact with the target. This plan attracted little official favor. In 1864, however, under the stimulus of the American Civil War, such a craft was actually demonstrated by Willoughby and Ramsey off Washington, D. C., in the Potomac River. A launch was powered by a petroleum-fired steam boiler and made an average speed of about 4 knots. It dragged two tiller lines behind it, the lines paying out from two drums on the shore. The application of a brake to either of these drums placed more pull on one tiller line than on the other and thus steered the launch much as a plow horse is guided.

The Whitehead torpedo, first tried out in 1868, is the prototype of all later torpedoes not electrically propelled. This torpedo, as accepted by the Austrian navy in 1868, was in two sizes, 14 in. dia. by 11½ ft. long, and 16 in. dia. by 14 ft. long. Both sizes ran 659 yd. at a speed of about 7 knots. The small size weighed 346 lb. and carried a charge of gun cotton. The larger size weighed 650 lb. and carried 60 lb. of gun cotton. A single screw was driven by a compressed-air engine. Horizontal steering was lacking. Vertical steering was accomplished by "The Secret," which is understood to have been similar in principle to more modern units, i.e., a hydrostat and pendulum both working upon a system of compound levers to operate rudders. Acceptance by the Austrian navy was followed successively in short order by Britain, France, Italy, and Germany; and later by practically all other countries, although the United States, shortly after 1900, went to the Bliss-Leavitt type, in which the same results are sought as in the Whitehead, but by the use of different mechanisms. Each country or firm licensing the Whitehead has varied or improved it according to its own ideas. The principal differences between the Whitehead and the Bliss-Leavitt types (1950) lie in the relative locations of compartments and mechanisms, and the use of turbines in the Bliss-Leavitt types instead of cylinder engines as in the Whitehead types.

Other forms of torpedo developed between 1867 and 1900, which have become obsolete, are described in the following.

**Towed Torpedoes.** Towed torpedoes were similar to the paravanes of World War I, but with additional means for steering and carrying explosive. Similar devices were used against submarines in World War I with little success.

**Projectile Torpedoes.** Projectile torpedoes were fired from an underwater gun with considerable velocity. They had no self-contained propulsion means.

**Rocket Torpedoes.** Most rocket torpedoes were very crude, but at least one had a system of duplex jets, one at the tail and one at the periphery just aft of the head (for better dynamic stability), and helical external vanes to impart spin. Failures were due to inefficacy of burning compounds and lack of means for steering.

**Gas-driven Torpedoes.** In gas-driven torpedoes, carbon dioxide or (in one case) ammonia, liquefied by pressure, vaporized and drove a cylinder engine or turbine.

**Locomotive Torpedoes.** Locomotive torpedoes embody a class so-called because they received power from an external source while running. One type was electric and another was operated by compressed air. A third type was driven by the unwinding of thin steel wires from drums within the torpedo onto large high-speed steam-engine-driven winches ashore. The drums within the torpedo drove propellers through gearing.

**Steam Torpedoes.** Steam torpedoes were charged with superheated water, under pressure, which generated steam as soon as the valve leading to the engine was opened. None got beyond the experimental stage.

**Inertia-drive Torpedoes.** Inertia-drive torpedoes involved a heavy flywheel, spun up to speed by external arrangements, energy being stored to drive propellers through gearing. The best development of this type, the *Howell,* was standard in the United States Navy from about 1890 to 1900. Its range and speed were somewhat less than the Whiteheads of that day, but this was considered compensated for by its inherent stability of direction, due to the gyroscopic effect of its flywheel. If the torpedo left its course, the gyro precessed, causing a list and a pendulum to swing, operating rudders to bring the torpedo back to course.

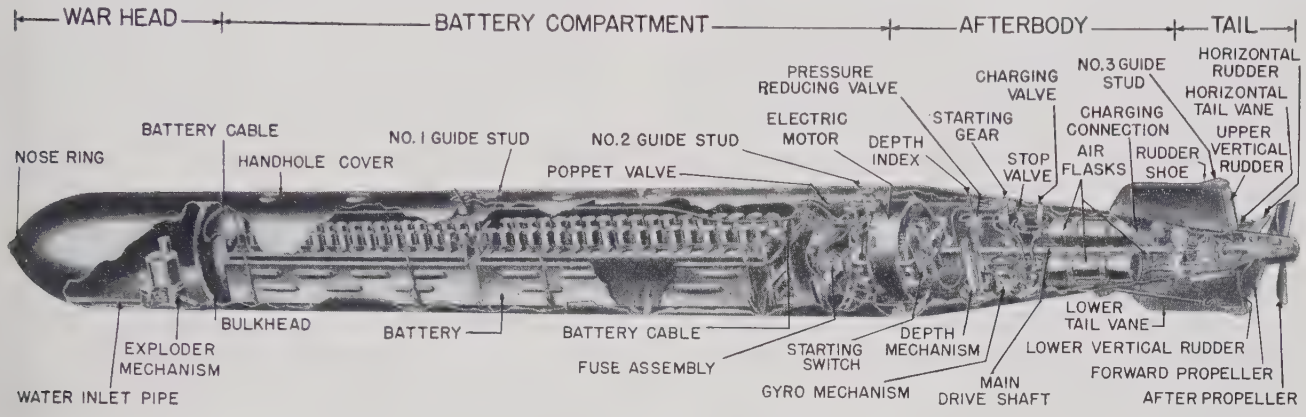
### BLISS-LEAVITT TORPEDOES

The United States Naval Torpedo Station, Newport, Rhode Island, commenced the manufacture of Bliss-Leavitt-type torpedoes in 1908, and has worked continuously upon their manufacture and improvement since.

**Arrangement.** In a typical United States Naval torpedo of 1940, the general arrangement of components is as follows; starting at the nose: (1) Head, containing explosive and explorer (or, for exercise shots, water, recording devices, and means for expelling the water at the end of the run); (2) Airflask, containing air at an initial pressure of about 200 atmospheres; (3) Fuel and Water compartments, with air connections to expel the liquids into the combustion pot; (4) Midship Section (open to sea), containing reducing valve for maintaining constant operating pressure of about 400 lb. per sq. in., combustion pot, valves and piping; (5) Afterbody, containing turbine and gear train, starting mechanism, steering controls and servos; and (6) Tail, containing mounting vanes, rudders and propellers.

**Aircraft Torpedoes.** Aircraft torpedoes underwent considerable improvement during World War II, particularly in the United States, which was already in possession of a torpedo which had been designed especially for aircraft drops

(in the matter of proportioning the shell for maximum beam strength, minimum air resistance and reasonable aerodynamic stability), while retaining good characteristics of water run. This torpedo had a slightly greater diameter than those intended for firing from ships and a considerably smaller ratio of length to diameter, and hence much greater beam strength. At the start of the war, it was considered that it should be dropped only between 30 and 75 ft. altitude, and from planes not making more than a little over 100 knots. Before the end of the war, however, the aircraft speed at which it was possible to successfully launch torpedoes had been more than doubled and the altitude of drop increased in even greater proportion.



U.S. NAVY PHOTO

*UNITED STATES NAVY ELECTRIC TORPEDO*

*Starting gear on top of afterbody is mechanically triggered as torpedo leaves its launching tube, opening air valves to: (1) spin gyro; (2) throw starting switch; and (3) turn air into steering servo motors. Torpedo proceeds to preset depth and course and, thereafter, is steered automatically: vertically, by a depth mechanism; and horizontally, by a gyro mechanism.*

**Electric Torpedoes.** Electric torpedoes have one great advantage in that no exhaust smoke or bubble trail shows; and one disadvantage (which under some circumstances is almost of equal importance), the relatively great weight per unit of energy of the conventional lead-acid storage battery. By reason of this weight, the comparison of a Bliss-Leavitt torpedo with an electric torpedo of the same outline, weight range, and explosive capacity indicates that the former provides almost three times as much work as the latter. Other means of producing electric power, having very much less weight per unit of energy, are well known but are prohibitive in cost except for special applications.

**Torpedo Exploders.** Torpedo exploders in early Whiteheads were mechanical triggering devices. Next, chronologically, came types which were actuated by the inertia of a relatively heavy part. Both of these exploded the torpedo on actual contact.

The Germans, in the latter part of World War I, had some success with an influence exploder which utilized a sensitive galvanometer registering changes in magnetic field, due to the proximity of a ship, and activating a relay firing system when such changes occurred.

**Target-seeking Torpedoes.** To John Hayes Hammond, Jr., is attributed the invention in the 1920's of a device which could be mounted in a torpedo and then would cause it to follow any target which came within its range of sensitivity. Target-seeking torpedoes were not used in combat until the latter half of World War II.

**Torpedo Launching.** From surface ships of any size, torpedoes are expelled from torpedo tubes by air pressure, or by the gas pressure generated by burning a small charge of powder. Torpedoes built for this service are launched without injury or perturbation of their controls from heights of about 25 ft. above the water from vessels traveling at 30 knots, or better.

In submarines, the conventional torpedo tube resembles an air-lock, having pressure-tight doors at both breech and muzzle. The muzzle door being secured and the tube drained of water, the breech door is opened and a torpedo loaded in. The breech door is then closed, the tube flooded, and the muzzle door opened. When ready to fire, a charge of compressed air, admitted near the breech, expels the torpedo. *See also* NAVAL MINES. J. M. St.

**TORPEDO BOAT.** *See* SHIPS, NAVAL (*Combatant Vessels; Patrol Vessels*).

**TORQUAY** [tɔrki′], a municipal and parliamentary borough, seaport, and resort in Devonshire, England, situated on terraced hills above Tor Bay on the English Channel, about 220 mi. southwest of London. It is known as the English Riviera. There are evidences of Roman, Celtic, Saxon, and Norman occupancy. The present town was founded in 1196, but its growth dates from the nineteenth century when it became popular as a resort. Torquay has figured in history as the spot where Don Pedro's galley was towed after the defeat of the Armada in 1588 and as the landing place of William of Orange in 1688. In World War II Torquay was bombed; the damage was extensive and many children were killed. Kent's Cave contains relics of great antiquity, and interesting buildings include ruins of twelfth-century Tor Abbey and the thirteenth-century "Spanish Barn" where Armada prisoners were held. Pop. 1954, 49,270. A. W.

**TORQUEMADA, TOMÁS DE** [tɔ′rkemɑ′ŧhɑ] (1420-1498), first Grand Inquistor of Spain, was born in 1420 at Valladolid, where he entered the Dominican monastery in early youth. He was later appointed Prior at Segovia, and in 1474, upon the accession of Isabella to the throne of Castile, became one of her most influential councilors but refused ecclesiastical honors. The Spanish Inquisition, established under Ferdinand and Isabella in 1478, was rapidly centralized by Torquemada after his appointment in 1483 as Grand Inquistor. He gained the reputation, partly deserved, partly exaggerated, of great cruelty in his conduct of the Spanish Inquisition, which, according to most historians, was responsible for the burning of some two thousand persons between

1481 and 1504; and he was chiefly instrumental in obtaining the expulsion of the Jews from Spain in 1492. He died at Avila, Sept. 16, 1498. *See also* INQUISITION, THE. W. C.

**TORRANCE** [tɒ′rəns], an industrial city in southern California, in Los Angeles Co., 16 mi. south of Los Angeles. The farmers in the district raise fruit and vegetables. Founded in 1911 by Jared Sidney Torrance and incorporated as a city in 1921, the community is governed by a council and manager. Torrance is the site of a county hospital. It has transportation facilities provided by the Pacific Electric, the Atchison, Topeka and Santa Fe, and the Southern Pacific railroads. Located in an oil region, Torrance has a large oil refinery. Other industrial establishments include iron and steel works, railroad shops, aircraft plants, and machine shops. The varied factory output includes synthetic rubber, plumbing supplies, tools, insulation products, oil machinery, and aluminum. Pop. 1950, 22,241.

**TORRENS SYSTEM** [tɒ′rənz], in law, a system or code of registration of title to real estate, originally adopted in South Australia in 1858 under the sponsorship of its premier, Sir Robert Richard Torrens, and subsequently enacted in other English dominions, in England, and in several states in the United States. New York has had a title registration code patterned on the Torrens systems since 1908. In the United States, title registration under Torrens system laws involves resort to a judicial proceeding and the determination of title therein; elsewhere the proceeding is conducted by administrative officers. H. Si.

**TORREÓN** [tɔ′rreɔ′n], a city in the state of Coahuila, northern Mexico, situated 500 mi. northwest of Mexico City. It is a railway junction, and the numerous mines in the district and various industries make it the most important commercial center in the state. New as Mexican cities go, Torreón is the setting of an interesting sociological experiment. In the 1930's one of the world's largest experiments in collective agriculture was undertaken at Torreón. An extensive tract of land was expropriated and 160,000 peasants were allotted acreage. A community of farms, residences, stores, schools, and recreation centers was built, and farming machinery was provided. Annual institutes, where visitors may study the project, are held. Torreón was made a city in 1907, and has arcaded shops, government buildings, hotels, banks, and churches. Pop. 1950, 128,976. S. G. I.

**TORRES STRAIT** [tɒ′rəs], a broad, shallow, island-studded body of water, 80 mi. wide, separating the southwestern part of the Australian Territory of Papua in New Guinea from Cape York Peninsula in northeastern Australia at 10° S. lat., and 142° 30′ E. long., and connecting the Coral and Arafura seas. The strait is named after the Spanish navigator Torres, second-in-command on De Quiros' voyage of discovery, who sailed through the strait in 1606. Thursday Island is the center of activity for a fleet of small vessels plying the waters of the strait in search of pearls and pearl shell. R. G. B.

**TORRES Y VILLARROEL, DIEGO DE** [to′rres i vilyɑrroɛ′l] (1693-1770), Spanish author, was born in Salamanca. He studied the humanities there for a short period but at the age of twenty ran away to Portugal in a successful search for an adventurous life. On his return to Spain, Villarroel lived in poverty in Madrid for a time, but he presently returned to his studies, and after completing courses in medicine and mathematics, was appointed professor of mathematics at the University of Salamanca in 1726. He was ordained a priest in 1745 and died in 1770.

Villarroel's works are a complete expression of his unconventional life. He consciously lived, as he admitted, like a "character from a picaresque novel," and this curious self-realization was expressed in his outstanding work, the autobiographical *Vida, ascendencia, nacimiento, crianza y aventuras del doctor don Diego de Villarroel* (first part, 1745; second part, 1752; third part, 1758) ("The Life, Ancestry, Birth, Education, and Adventures of Doctor Diego de Villarroel"). This is the last great picaresque novel in Spanish literature, differing from all others in that it tells the history of a life deliberately picaresque, of a man who wanted to live as had Guzmán de Alfarache and Lazarillo de Tormes. Even Villarroel's style reflects this joining of literature to life; it is uneven, unpolished, and disorderly, but it contains an amazing vitality.

Villarroel also wrote satirical poetry in the manner of Quevedo, but these poems were mostly written for particular occasions and have consequently lost much of their original interest. The *pronósticos* ("Predictions"), poems published annually in which he foretold the future, gave him enormous popularity. He appeared to have a certain intuition of what was to come and was seemingly able to predict such historical events as the French Revolution. Many people believed that Villarroel possessed supernatural powers, yet he himself consistently attacked the many superstitions prevailing at the time with almost the same intensity and open belligerence as his contemporary, Feijoo. He is undoubtedly one of the most extraordinary figures of the Spanish eighteenth century. Although he lacked the serenity of the Spanish rationalists, who were under French influence, he was far more characteristically Spanish in his devotion to a mixture of science and folklore, anarchism and method. J. A. L. M.

**TORREYA** [tɒ′riə], a small genus of evergreen trees of the yew family, also called *Tumion*. The California nutmeg, *T. californica,* can be grown satisfactorily in the southern and central United States; but in more northern regions it may become deciduous. The glossy, needlelike leaves, dark green above, have two whitish bands on the under side. The drupelike fruits, which ripen the second season, are green, streaked with purple. The whorled branches give the 70 ft. tree a pyramidal effect. *T. taxifolia,* the stinking cedar, is found in only a limited area in northwestern Florida and adjacent Georgia, and is somewhat smaller, growing to about 40 ft. C. H. Wo.

**TORREY PINE.** *See* SOLEDAD PINE.

**TORRICELLI, EVANGELISTA** [to′rritshɛ′lli] (1608-1647), Italian physicist and mathematician, was born Oct. 15, 1608, in Faenza. In 1627 he went to Rome and studied mathematics under Benedetto Castelli. After reading avidly the works of Galileo on motion, he composed a treatise on the same subject entitled *Trattato del moto.* He then became Galileo's pupil and secretary and later succeeded him as professor of mathematics and philosophy in Florence.

In 1643, Torricelli expanded on the findings of Galileo and proved that air has weight and that a suction pump cannot raise water more than about thirty-three feet. Aided by Vincenzo Viviani (1622-1703), Torricelli discovered that when a tube closed at one end having a length greater than thirty inches is filled with and inverted in a dish of mercury, the mercury in the tube reaches a height of approximately thirty inches above the mercury level in the dish, leaving a vacuum in the upper end of the tube. From this Torricelli

inferred that the pressure of the atmosphere on any area is equal to the pressure that a column of mercury thirty inches high would have on the same area. This was, in effect, the first barometer, and many barometers at present are identical with Torricelli's tube. Aside from his invention of the barometer, Torricelli is well known for a theorem in fluid mechanics. This states that if a hole is opened in the side of an open vessel filled with a liquid, the velocity of the resulting liquid jet, neglecting exit losses, is the same as if the liquid had fallen freely through a distance equivalent to the height of the surface of the liquid above the hole. He died in Florence Oct. 25, 1647. I. B.

**TORRINGTON,** a city in northwestern Connecticut, in Litchfield Co., on the Naugatuck River, about 19 mi. north of Waterbury. Torrington was settled in 1737 and incorporated as a township in 1740. A woolen mill was built by the Wolcott family in 1813 and the village became known as Wolcottville until 1887, when Torrington was incorporated as a borough. In 1923 it was chartered as a city. Brass kettles were made here in Colonial times and the city is still a noted brass manufacturing center. In August 1955 Torrington suffered severe flood damage and many of its industries, including bearings, hardware, electrical appliances, woolen goods, and its brass works were seriously affected. It is on a branch of the New York, New Haven, and Hartford Railroad. Pop. 1950, 27,820.

**TORTOISE** [tɔ′rtəs], properly, any member of the family Testudinidae, characterized by unwebbed feet having stubby digits, hind feet which are often elephantlike, and a plated snout; often, a terrestrial species of another family, as the box tortoise, a land-living pond turtle, Emydidae; occasionally, an aquatic form, as the hawksbill "tortoise." The world over, true tortoises are, and have been for millions of years, remarkably alike in that they have a high-domed form, but they vary greatly in size and pattern, carapaces ranging from uniform black to geometric patterns of bright colors. The hinge-back tortoises of Africa, *Kinixys,* protects its indrawn head and limbs by closing the carapace. The pancake tortoise, *Malacochersus tornieri,* of East Africa, which lays a single egg, has its shell reduced to a bony framework; it can squeeze into a rock crevice, inflate the body, and defy extraction. *See also* Box Tortoise; Giant Tortoise. M. G. N.

**TORTOSA** [tɔrto′sɑ], a city, the seat of a bishop, in the province of Tarragona (Catalonia), northeastern Spain. It is strategically situated on the left bank of the Ebro River, 20 mi. from its mouth, and enjoys an essentially Mediterranean climate. Known to the Romans as Colonia Julia Augusta Dertosa, it was taken in 718 by the Arabs who held it almost continually until the twelfth century. Tortosa was named the object of a crusade by Pope Eugenius III in 1148, and Ramón Berenguer IV, Count of Barcelona, took it with the aid of Italian forces. The French captured it in 1708 and again in 1811, holding it until 1814. The older quarter of Tortosa, crowded between the river and the nearby hills, has narrow, winding streets and ancient, stone houses. The Cathedral was built (1158-1178) on the site of a mosque of the time of Abd-er-Rahman III (891-961). It was given Gothic form in the fourteenth century and Baroque features were added later.

The city's products include paper, ceramic articles, leather, glass, and soap, as well as marble and alabaster from near-by quarries. It also acts as trading center for the abundant crops of rice, fruit, olives, and vegetables grown in the surrounding fertile *campiña* region. Tortosa is on the Valencia-Barcelona railroad. Pop. 1940, 38,269. R. G. W.

**TORTUGA** [tɔrtu′gɑ], the name of two islands located in the West Indies. The more northerly, also known as La Tortue, lies just north of Port de Paix, Haiti, and belongs to that country. This island, which is about 23 mi. long from east to west and about 4 to 5 mi. across, is of limestone structure, rising through several terraces to about 1,100 ft. elevation. The semiarid soil supports only a transient population. The island is best remembered as a buccaneers' hideout and stronghold during the seventeenth century and as a penal colony subsequently.

The second Tortuga, a Venezuelan possession, lies 50 mi. north of Barcelona on the Venezuelan coast and the same distance west of Margarita Island. It is of irregular shape, about 15 mi. long from east to west and with a maximum width of about 7 mi., and is inhabited by a few pearl fishers. J. E. F.

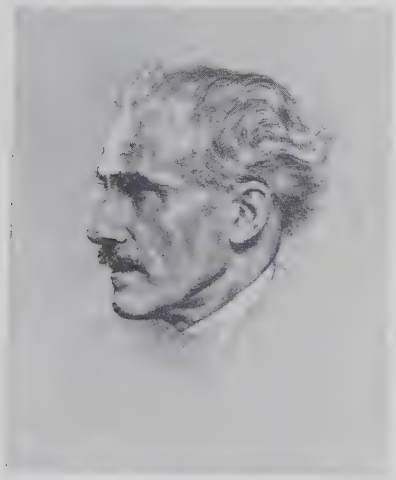
**TORY PARTY,** a political organization in England which originated in the reign of Charles II (1660-1685) when Thomas Osborne, 1st Earl of Danby, built up a royalist bloc in Parliament on the old Cavalier principles of a wide royal prerogative, the supremacy of the Anglican Church, and, in the economic sphere, an attachment to the landed interest. "Tory" was a nickname that had earlier been applied to Irish outlaws. The natural alliance of the Tories and the monarchy was broken by the Revolution of 1688, and the Hanoverian accession in 1714 kept them out of office for nearly half a century. They remained politically active, however, and in the duel for empire with France (1690-1763) they were isolationists and endeavored to keep England free from entanglement in Continental affairs. After George III succeeded in breaking the Whig dominance early in his reign, coalitions of factions rather than of parties governed the country until William Pitt the younger became prime minister in 1784, opening a period of Tory ascendancy. English reaction against the French Revolution and the war with France kept the Tories in office, save for one brief interval, until about 1830, when the Tory Party gave way to its successor, the Conservative Party. Despite a general reactionary temper the Tories were responsible for notable reforms under the guidance of George Canning (1822-1827). *See also* Conservative Party. A. H. Sw.

**TOSCA, LA** [lɑ to′skɑ], an opera in three acts by Giacomo Puccini with a libretto by Luigi Illica and Giuseppe Giacosa derived from the play of the same name by Victorien Sardou. The opera was first performed on Jan. 14, 1900, in Rome. Puccini here borrowed from both Verdi and Wagner. On the one hand, he used the Wagnerian leitmotiv and was not averse to new harmonic and instrumental devices when they could be used for dramatic effect; on the other, he modeled his soaring and expressive melodies on the typical Italian form developed by Verdi, though he maintained their tension in a way that Verdi, the great master of dramatic contrast, would never have done.

The story of *Tosca* is set in Rome about 1800, during the struggle between the monarchists and Bonapartists. Young Angelotti (bass), an escaped political prisoner, has been hiding in a Roman church with the assistance of his friend the painter Cavaradossi (tenor), who is the lover of the opera singer La Tosca (soprano). The villainous Scarpia (baritone), chief of police, arrests Cavaradossi for concealing Angelotti and proposes to execute him for this offense, but Tosca bribes Scarpia to order a mock execution by the prom-

ise of her favors. Neither Tosca nor Scarpia intend to keep faith, however; Tosca stabs Scarpia as soon as she is alone with him after he has ordered the executioners to use blank cartridges, and the officer in charge of the execution understands that despite his orders Scarpia intends the mock execution to be a real one. When Tosca realizes that her lover is dead and the murder of Scarpia discovered, she commits suicide by throwing herself over the wall of the prison castle Sant' Angelo into the Tiber. S. C.

**TOSCANINI, ARTURO** [to'skɑni'ni] (1867- ), Italian operatic and orchestral conductor, was born in Parma, Mar. 25, 1867. He began his career as a cellist, but dur-



ARTURO TOSCANINI

FROM A DRAWING BY LOUIS LUPAS

ing the 1886 Rio de Janeiro opera season Toscanini was catapulted into the conductor's role when the local director was hissed from the podium. In the years following this spectacular debut, Toscanini conducted principally at the Metropolitan Opera House (1908-1915) and at La Scala in Milan (1921-1929). His tenure as conductor of the Philharmonic Symphony Society of New York (1928-1936) raised that organization to new heights. In 1937 he became director of the newly formed National Broadcasting Company Symphony Orchestra, a position he held until his retirement in 1954. His enormous fame rests primarily on his interpretation of Italian and Wagnerian music. E. L. F.

**TOTALITARIANISM.** *See* Political Science and Philosophy (*Political Philosophy*).

**TOTEMISM.** *See* Primitive Religion (*Forms and Concepts*).

**TOTEM POLE,** a large girdled tree trunk decorated with painted carvings and erected by a family head or clan chief in front of his house as a memorial to his deceased predecessor. The design, being in the nature of a family or clan crest, usually contains a representation of the owner's guardian totemic animal and for this reason the memorial eventually was given the name of totem pole. These striking art objects have been found along the North Pacific coast from below the Canadian border to Alaska. There is reason to believe that they originated at or near the estuary of the Nass in British Columbia just south of the Alaskan border. Only on the Nass and the adjacent Skeena did the art penetrate far into the interior.

Until recently it was generally believed that this indigenous Indian art was of great antiquity. This view is now discredited. The first erection of totem poles now appears to date from the early nineteenth century. Late eighteenth-century explorers make no mention of these conspicuous objects although they do describe the Indian practice of painting and carving house fronts, exterior house posts, and interior beams. The origin of this art, therefore, lies well within the period of European contacts. The first contacts brought not only new tools but also strange ideas to stir the imagination of the Indian. The art forms, however, remained indigenous. Toward the end of the nineteenth century the art of making totem poles had begun to decline. It is now practically extinct. Two influences helped to hasten the decay of this once great art: Canadian and American contacts with the Indians eventually broke down tribal morale, and the Indian desire for prestige led to the substitution of impressiveness and size for the former creative artistry. W. M. W.

**TO THE LIGHTHOUSE** (1927), a novel by Virginia Woolf. It deals with the problem of attaining an organic relationship between human beings who are kept apart by their egocentricity. During the first part, "The Windows," Mrs. Ramsay, the central character, seeks through her charm and understanding to integrate her family and guests, including the penniless student Charles Tansley and the poet Mr. Carmichael, who are visiting at the Ramsay summer home in the Hebrides. The theme is continued through the efforts of Lily Briscoe to achieve form in her painting, which she does just as Mr. Ramsay and his son James reach the lighthouse, a symbol of unifying force. L. F. D.

**TOTOWA** [to'towə], a borough in Passaic Co., in northeastern New Jersey, situated southwest of the city of Paterson of which it is a residential suburb. A considerable part of the population is employed in the silk and dye mills of Paterson. During the Revolutionary War George Washington and his troops had a camp in Totowa and used a vacant field as drill-grounds. Totowa was settled by the Dutch. It is governed by a mayor and council. Pop. 1950, 6,045.

**TOUCAN** [tukɑ'n; tu'kan], any one of a number of species of medium-sized to large birds united in the family Ramphastidae. Although very different in appearance, they are allied to the woodpeckers, jacamars, and puffbirds. Tou-

TOUCAN

YLLA

cans are found in the tropical regions of the New World from Mexico to Argentina. Their most remarkable characteristic is an enormous, serrated bill, somewhat like the claw of a lobster, and usually found in a variety of gaudy colors.

Despite its solid appearance, the bill is hollow and quite light. Their plumage may be largely green or almost indescribable combinations of the brightest hues. Toucans inhabit the taller trees of dense forests, often traveling in bands, and feed mainly upon fruits, although they do not refuse large insects and their larvae, amphibians, lizards, or even small birds. They lay their white eggs in holes in trees. H. G. De.

**TOUCHSTONE,** the fool, or clown, in Shakespeare's comedy *As You Like It.* He accompanies Rosalind and Celia into exile in the Forest of Arden, where he woos and wins the country wench Audrey, "an ill-favour'd thing, sir, but mine own." Touchstone is a notable example of the Shakespearean fool, whose apparent witlessness is merely the cloak that disguises a paradoxical wit. R. V. L.

**TOUGALOO COLLEGE** [tugəlu′], an accredited, coeducational institution of arts and sciences for Negroes, affiliated with the Congregational and Christian Churches of America. The campus covers about 500 acres in Tougaloo, Miss. First instruction was given in 1869. The first four-year college course was offered in 1897. Only the A.B. degree is offered in liberal arts. Students from outside the city must live in the college residence halls or in approved homes. The majority of the scholarship awards are restricted to Mississippi residents. Opportunities for self-help exist. *For statistics see* COLLEGES AND UNIVERSITIES. J. R. To.

**TOULON** [tu′lɔ̃′], a leading naval arsenal of France, situated in the department of Var on the Mediterranean coast, 410 mi. southeast of Paris and 30 mi. southeast of Marseille. It lies at the head of a deep bay, sheltered by a breakwater, beyond which is a vast roadstead protected by the peninsulas of Cap Cépet and Cap de Giens.

Said first to have been settled by the Phoenicians, the site was known to the Greeks as Telenion and to the Romans, who made it a naval station, as Telo Martius. Bequeathed by the last descendant of the Viscounts of Marseille to Charles of Anjou, Count of Provence, it passed in 1481, with the rest of Provence, to the King of France. Although it was fortified during the reign of Louis XII (1498-1515), it became an important stronghold only during the reign of Henry IV (1589-1610). During the War of the Spanish Succession, it resisted in 1707 a combined attack by Austrian and Sardinian land forces and English and Dutch fleets. The Royalists of the city handed it over to the British during the French Revolution; but after a three-month siege, during which Napoleon Bonaparte first distinguished himself, the Republican Army recaptured it in December 1793. During World War II, the French on Nov. 27, 1942, scuttled their fleet, at anchor there, to prevent its falling into German hands. Toulon was much damaged in the course of the war before its liberation on Aug. 28, 1944.

Toulon derives its support from naval activities, fishing, the tourist trade, and marketing of farm produce. The local manufactures include chemicals, soap, pottery, carpets, and briar pipes. Pop. 1954, 141,117. W. McE.

**TOULOUSE** [tu′lu′z], capital of the department of Haute-Garonne in southwestern France, near the foothills of the Pyrenees on a bend of the Garonne River, 360 mi. south of Paris and 130 mi. southeast of Bordeaux. Known originally as Tolosa, Toulouse, now a university and trade center often called the "rose-red city" because of its many brick buildings, was a stronghold of the Gauls. When the Merovingian ruler Dagobert created the kingdom of South Aquitaine in 628 for his brother Charibert, Toulouse became its seat. After the establishment of their independent countship in the ninth century, the power of the Counts of Toulouse grew until by the beginning of the twelfth century they controlled the greater part of southern France. The support lent by Count Raymond VI to the Albigensian rebellion against the Church of Rome led to a siege of the city in 1211 by the forces of Simon IV de Montfort l'Amaury. He occupied the town in 1215, but lost his life in another siege in 1218. In 1271 Toulouse passed to the crown of France. As capital of the royal province of Languedoc, it became the seat of the parlement of Toulouse, founded in 1302, which acquired a reputation for its stern measures against religious heretics. Toulouse was invaded by the British after the Duke of Wellington defeated Marshal Soult in battle on Apr. 10, 1814, on the heights to the northwest. The marketing center of an important agricultural region, Toulouse has food and beverage processing plants, flour mills, distilleries, bakeries, chemical works, soap plants, hat factories, and foundries. Pop. 1954, 268,863. W. McE.

**TOULOUSE, UNIVERSITY OF,** at Toulouse, France, the third oldest French university, founded in 1229. In the Treaty of Paris, Blanche of Castile, regent for Louis IX, on Apr. 12, 1229, compelled Raymond VII, Count of Toulouse, to establish a university as a means of extending orthodox thought and combating the Albigensian heresy. To do this, the count took over the Collège de St. Raymond, founded at the end of the eleventh century and now maintained as a museum. The university was first granted full privileges as a *studium generale* with fourteen chairs in 1233 by a Papal Bull of Gregory IX. By 1500 the university had ten colleges, all the ecclesiastical type. In 1751 the University of Cahors, founded in 1332, was merged with Toulouse. During the French Revolution at the end of the century the university was closed; reopened in 1805, it was reorganized in 1896. The university includes faculties of law, science, letters, medicine, and pharmacy. In 1948 the enrollment totaled 7,190, and the staff numbered 109. The library contained 1,290,376 volumes. A. L. H.-Q.

**TOULOUSE-LAUTREC, HENRI DE** [tu′lu′z lo′-trɛ′k] (1864-1901), French painter and lithographer, was born of ancient noble lineage at Albi, Nov. 24, 1864. He was a delicate child and became dwarfed when his legs, which were broken several times, healed improperly. His father, an ardent sportsman, disdained an artist's career for his son, but permitted the precocious boy to study with his friend, the sporting painter René Princeteau. In 1882 Lautrec went to Paris to study under the academic artists Léon Bonnat and Fernand Cormon, but after a year he tired of their instruction and established his own studio. In his desire to interpret modern life he turned to the Impressionists, particularly to the work of Hilaire Degas. He adopted the older artist's point of view, but quickly developed his own angular and nervous variations of Degas' linear pattern. Among other things which influenced his painting were Japanese prints, from which he derived his characteristic oblique design and simplified perspective.

By birthright Lautrec might have moved in the highest Parisian society but, possibly because of his affliction, he preferred the company of artists, theatrical people, and cabaret entertainers. His subjects, which he interpreted with remarkable psychological insight, were almost exclusively drawn from the night life of Paris, centered in the restaurants and dance halls of Montmartre. In addition to his painting,

executed in a variety of media frequently experimental, Lautrec was a prolific lithographer, producing not only independent prints but numerous book illustrations and commercial posters. These were among the first to be designed by an artist of his rank and exercised considerable influence on similar work in England and the United States. Lautrec's frail body could not long support a life of intense artistic effort combined with unmitigated physical indulgence. In 1899 he retired to a sanatorium. Although false rumors circulated that he was insane, during his confinement he produced from memory an astonishing series of circus drawings. A few months after his release he died at the family château of Malromé, Sept. 9, 1901. G. H. H.

**TOURACO** [tu′ra′ko′], any one of a number of species of medium- to large-sized nonsinging birds united in the family Musophagidae and allied to the cuckoos. They inhabit most parts of tropical Africa south of the Sahara Desert. Touracos are characterized by a heavy, sharp-edged bill, a bushy, erectile crest, an unusually long tail, and feathers of silky texture. The red wing feathers of certain forms yield a reddish-violet pigment, turacin, that contains copper. Their plumage may combine soft browns and grays or may show brilliant greens, blues, and reds, set off by black and white. These birds, sometimes known as plantain eaters, live in wooded country and feed chiefly on fruits. Their voices are extraordinarily loud and harsh. H. G. De.

**TOURAINE** [turɛ′n], former French province in west central France, bounded by the provinces of Anjou on the west, Maine on the north, Orléanais on the northeast, Berry on the east and southeast, and Poitou on the southwest. Its capital was Tours. The Turones, a Gallic people, submitted to Caesar during his first campaign in Gaul, but in 52 B.C. joined in the revolt under Vercingetorix. During the barbarian invasions the region was conquered by the Visigoths in 475 and by the Franks between 494 and 507. Under Frankish rule, and under Charlemagne, it was a countship. In 1044 it came under the rule of Anjou and passed with that province to the ruling house of England. In 1203 Philip Augustus of France confiscated the English holdings. In 1356 John the Good made Touraine a duchy for his son Philip, who later became Duke of Burgundy. It continued an appanage of the sons of the royal family until, on the death of the Duke d'Alençon, it was united to the crown in 1584 by his brother. Four important residences of the French kings were in Touraine: Loches, Plessis-les-Tours, Blois, and Chinon, where Joan of Arc asked Charles VII to form an army for her. The old place-names of Touraine are among the best known in France as a result of the writings of Gregory of Tours (c.538-593). In 1790 the province was divided among the present administrative departments of Indre-et-Loire, Loir-et-Cher, Indre, and Vienne. F. C. H.

**TOURCOING** [tu′rkwæ̃′], manufacturing city of northern France, in the department of Nord, within 1 mi. of the Belgian frontier, and 8 mi. northeast of Lille. It is closely united with the neighboring city of Roubaix to the south. Tourcoing is one of the most important textile centers of France. Its chief industries are wool-processing, and the manufacture of woolen, cotton, and silk goods. It is especially noted for its carpets. The sugar industry is also important, and other industries include brewing, tanning, dyeing, and the manufacture of soap, textile machinery, and hardware. Historically, Tourcoing is notable as the scene of the defeat of the Austrians and the English by the Republican army, under Moreau and Souham, in 1794. During World War I, the city lay in the path of the great battles of 1917 and 1918 and was severely damaged. The only building of note is the Gothic church of St. Christophe, rebuilt in 1862 in fifteenth-century style. Pop. 1954, 83,416. C. W. D.

**TOURMALINE** [tu′rməlɪn; tu′rməlin], a complex silicate of boron and aluminum. Ca, Mg, Mn, Fe, Li, and Cr may be part of the formula in some varieties. Tourmaline has a hardness of 7-7.5 and a density of 2.98-3.20. Indices of refraction vary from 1.619-1.643. Tourmaline is strongly dichroic, a conspicuous feature of the mineral. Tourmaline crystallizes in the hexagonal system. Tourmaline is also noted for producing piezo-electric and the pyro-electric effects. The fine, clear-colored species are much in demand as gemstones. Tourmaline occurs in a wide range of colors which have given rise to many varietal names. Rubellite, indicolite, achroite, dravite and schorl have been applied to the red, blue, colorless, brown, and black varieties respectively. Still other colors are green, yellow, and pink. Tourmaline may exhibit several colors in the same crystals. The line of demarcation between the colors is often very sharp. Colored varieties from Brazil are known in the trade as "Brazilian emerald," "ruby," and "sapphire." The mineral is found in granite and pegmatite rocks as well as in formations which owe their origin to metamorphism—the schists, gneisses, and crystalline limestones. Fine specimens of tourmaline, of large size, are found in many parts of the world. The Ural Mountains of Russia, the Minas Gerais province of Brazil, Ceylon, and Madagascar are sources of tourmaline. Many gem crystals have been obtained from Paris, Maine; Haddam, Connecticut; and Pala, California. The province of Ontario, Canada, has numerous deposits of the mineral. Tourmaline does not fluoresce when subjected to either ultraviolet or X-ray radiation. A. E. A.

**TOURNACHON, FÉLIX** [tu′rna′shɔ̃′] (1820-1910), better known by his pseudonym, "Nadar," French aeronaut, journalist, and photographer, was born in Paris, Apr. 5, 1820. Professionally a journalist, caricaturist, and photographer, he became interested in aeronautics about 1860. He collaborated in the design of a steam-driven helicopter displayed at the London Aeronautical Exhibit in 1868. His great balloon *Le Géant,* first flown in 1863, was 196 ft. high and 100 ft. in diameter, could lift well over four tons, and was the largest balloon built up to that time. Nadar was one of the earliest experimenters with aerial photography, but his efforts were unsuccessful, and credit for the first satisfactory aerial photographs went to William Black for his views over Boston in 1860 from the balloon of Samuel Archer King. Nadar's organization of the Balloon Post during the Siege of Paris in the Franco-Prussian War in 1870 and 1871 was his greatest achievement. Between September 1870 and January 1871 sixty-five balloons were built and flown to points outside Paris successfully, carrying 164 persons, 381 carrier pigeons, and over 20,000 lb. of mail. One of Nadar's exploits in 1870 was his victory over a Prussian observer in an aerial pistol duel from balloons over Paris. He died in Paris, Mar. 21, 1910. M. H. Sm.

**TOURNAI** (*Fl.* Doornik) [tu′rne′, do′rnɪk], a small city in the province of Hainaut, in southwestern Belgium, on the Schelde River, 45 mi. southwest of Brussels, near the French border. An ancient community, Tournai was occupied in Julius Caesar's time and called Civitas Nerviorum

or Castrum. In the fifth century it was the seat of the Merovingian kings. Throughout its history until Belgium became an independent nation in the 1830's, Tournai was a strategic objective of all invading armies. In World War I the city once again was subjected to enemy attack. In August 1914 the Germans captured Tournai, remaining in control until Nov. 8, 1918, when the British entered the city. The city did suffer some damage in World War I, but it was negligible compared to that resulting from bombing raids and occupation during World War II. Most of the damage to important buildings was the result of German incendiary bombing in 1940. The famous cathedral of Notre Dame was damaged, and the chapel adjoining the cathedral was completely gutted by fire. The destruction was particularly disastrous to the old section of Tournai, but many buildings and notable examples of Medieval architecture have been restored. The Museum of Fine Arts and the Church of St. Jean Baptiste escaped unscathed. The notable industries of the city include the manufacture of carpets, embroideries, and porcelain. Pop. 1952, 32,528. S. D. M.

**TOURNAMENT.** *See* Jousts and Tournaments.

**TOURNEUR, CYRIL** [tɜ′rnər] (c. 1580-1626), English author, was born about 1580. The earliest known fact of his life is that in 1600 he published *The Transformed Metamorphosis,* a satirical allegorical poem. He became secretary to Sir Francis Vere, English general in the Netherlands, of whom he wrote *A Funeral Poem* (1609). His play *The Atheist's Tragedy* was published in 1611, and *The Nobleman,* now lost, was acted in 1612. Tourneur wrote a *Character* of Robert Cecil, Earl of Salisbury, and *A Grief on the Death of Prince Henry.* After carrying government despatches to Brussels in 1613, he held military office under Sir Edward Cecil and the States of Holland. The Privy Council imprisoned him briefly in 1617, but in 1625 appointed him secretary to the council of war on Cecil's expedition against Cádiz. Tourneur became ill during the voyage and died at Kinsdale, Ireland, on Feb. 28, 1626.

*The Revenger's Tragedy,* a masterpiece of Jacobean drama, has been commonly attributed to Tourneur, but without adequate evidence. Published anonymously in 1607, it was assigned to Tourneur by later booksellers, but scholars are not agreed whether Tourneur or Thomas Middleton was its author. Tourneur's one certain extant play, *The Atheist's Tragedy,* expresses a Christian stoicism very different from the imaginative passion of *The Revenger's Tragedy.*

**TOURNIQUET.** *See* First Aid.

**TOURS** [tu′r], a city in west central France, on the Loire River, about 130 mi. southwest of Paris. It is the chief city of the department of Indre-et-Loire. Before the Roman conquest of Gaul, Tours was an important village of a Gallic tribe called Turones. The Romans moved the settlement from the north bank of the Loire to its present site south of the river and named it Caesarodunum. Later known as Urbs Turonum, or Turoni, the community was made the capital of a Roman province in Gaul A.D. 374. It was overrun by the Visigoths in 473 and captured by the Franks in 507. In 732 the Frankish ruler, Charles Martel, defeated an invading Arab army near Tours in the decisive battle that effectively destroyed the Moslem threat to France. Tours subsequently became the capital of the counts of Touraine. It passed under the English crown when Eleanor of Acquitaine married Henry II of England but was returned to French dominion after Eleanor's death in 1204. Tours grew rapidly and became extremely prosperous. It was a favorite residence of French kings, and the Estates General met frequently in the city. Tours developed into an important silk-weaving center, but when the revocation of the Edict of Nantes in 1598 forced 40,000 Protestant workers to flee the city, Tours declined in importance and has never regained its former prestige. The city was the provisional capital of France for three months in 1870 during the Franco-Prussian war and was occupied by the Prussians in January 1871. In 1940, during World War II, the French government sought refuge in Tours before going on to Bordeaux. The city was bombed and its old quarter along the Loire was severely damaged.

BURTON HOLMES FROM EWING GALLOWAY

*View of Tours, France*

Tours now extends from the Loire south to the Cher River. It is divided into four sections by two broad boulevards that intersect at right angles. At their intersection are the Hotel de Ville and the Palais de Justice, while in the northeast section of the city is the Cathedral of St. Gatien. The cathedral, begun in the twelfth and finished in the sixteenth century, is noted for its magnificent stained-glass windows and its fifteenth-century cloisters. In the same section of the city stand two towers, all that remains of the ancient basilica of St. Martin, which was praised in the sixth century by Gregory of Tours, rebuilt in the twelfth and thirteenth centuries, and almost completely destroyed during the French Revolution. Near by is the tomb of St. Martin. In the old northwest section are such relics of the fifteenth and sixteenth centuries as the Hotel Gouin, the House of Tristan l'Hermite, and the Fontaine de Beaune. Tours is the center of the historic chateaux district of the Loire Valley. Honoré de Balzac and the painters Clouet and Fouquet were born in Tours, and the philosopher Descartes was born in the vicinity. Aside from its historical importance, the city is also an educational center. The Institute of French Studies, a division of the University of Poitiers, created to serve foreign students, is located in the city along with schools of medicine and pharmacy, fine arts, and music. There is a museum of art in the former archiepiscopal palace and a library with a rich collection of manuscripts.

Tours is the principal market center for the rich farms of the surrounding area and is noted for the production of potted pork, dried prunes, wines, and brandies. Its industries manufacture silks and laces, carpets, metal products, hemp, paper, sealing wax, stained-glass windows, and books. Pop. 1954, 83,618.

**TOURS, BATTLE OF,** sometimes called the Battle of Poitiers, considered one of the decisive battles of the world, because it turned back the tide of Moslem invasion in western Europe, was fought in October, A.D. 732. In A.D. 711 the Moslems had crossed into Spain from northern Africa and rapidly overrun the Visigothic kingdom. Advancing into southern Gaul, they defeated Eudo of Aquitaine at Bordeaux, took Poitiers, and pressed on toward Tours. Not far from Poitiers they were met by the Franks under Charles Martel, augmented by the remains of Eudo's forces. After a week's delay the battle was joined, and at the end of a day's furious fighting the Moslems withdrew from the field, having suffered great losses, including the death of their leader, Abd-er-Rahman. Charles obtained the acclaim of the western world as the champion of Christendom, and the Moslem hold on France was reduced to a small territory in the south. F. C. H.

**TOUSSAINT L'OUVERTURE, PIERRE DOMINIQUE** [tu'sæ' lu'vɛ'rtü'r] (1743-1803), Haitian general and liberator, was born near Cap François in 1743. A Negro slave, he joined the forces of the insurgent Haitian blacks in 1791 and advanced rapidly in the native army. When the French government proclaimed the freedom of the slaves, Toussaint sided with the French military effort to oppose British interests on the island. In 1797 the French named him commander-in-chief of the troops in Santo Domingo. Expelling the English and Spaniards, he soon established his rule in Haiti, and under his able and just administration the country prospered. When Toussaint challenged the authority of France in 1801, Napoleon sent a strong force under General Charles Leclerc to subdue the self-styled "Bonaparte of Santo Domingo," who was captured and allowed to retire to an estate. Shortly thereafter he was detected conspiring against the French and was sent to France, where he died in prison near Besançon, Apr. 27, 1803. G. Q.

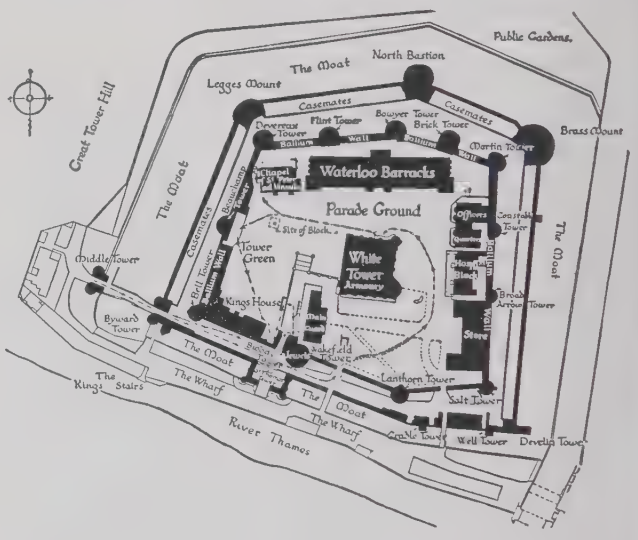
**TOWBOAT.** *See* VESSELS, INLAND WATERWAY.

**TOWER OF LONDON,** a fortress, garrison, and museum on the north bank of the Thames River in London, England. Including the surrounding gardens, the Tower covers eighteen acres, twelve of which are within the outer walls. It is surrounded by a wide, deep moat, now dry, which is used as a parade ground. Originally there were only two entrances: the Middle Tower and St. Thomas' Tower, the latter giving on to the river through the Traitor's Gate, which retains its original portcullis.

The oldest and central part of the fortress is the White Tower, built by William the Conqueror in 1078, which is a castle in itself. The name refers to the Caen stone used in its construction, and it was whitewashed in medieval times. It incorporates the Chapel of St. John, an exceptionally fine and intact example of Norman architecture. The tower is 90 ft. high and houses the armories, the record room, the Tudor room (with Henry VIII's armor), and a large collection of cannon and other armament. The White Tower was held in pledge by the citizens of London for the completion of the Magna Charta, and many illustrious prisoners were lodged in it over the centuries, including Elizabeth and Mary Tudor.

A large modern barracks stands near the site of the royal palace destroyed by Oliver Cromwell, and near the barracks is the small twelfth-century chapel of St. Peter ad Vincula, containing, among others, the graves of Anne Boleyn and Catherine Howard, wives of Henry VIII, who were beheaded on the scaffold a few yards from the chapel. The executions of less important prisoners were carried out on Tower Hill, outside the fortress, or at Tyburn. The Beauchamp Tower is on the inner wall, and dates from the twelfth century. Among famous persons imprisoned there were Lady Jane Grey and Sir Walter Raleigh. The King's House, where Anne Boleyn was lodged before her execution, is a private residence. There are a number of other buildings, including the Wakefield Tower, which houses the crown jewels. Here, in a double cage, are displayed the crowns, scepters, and other regalia, some of which are used on state occasions.

Associated with the Tower of London are the famous Yeomen of the Guard, or "Beefeaters" (from the French *buffetier*), pensioners whose duties are directly connected with ceremonial occasions. Their costume is of the original Tudor design. To complete the medieval atmosphere are ravens, which have inhabited the green for several hundred generations. The nightly "Ceremony of the Keys" is performed



COURTESY OF THE BRITISH INFORMATION SERVICES

*Plan of the historic Tower of London, showing the route taken by visitors*

shortly after dark. The Yeoman Warder, carrying the keys and a lantern, and with an armed escort, locks the ancient doors of the Byward Tower; the present arms is given, and the Tower is considered closed until dawn. This custom has remained unbroken for more than 600 years. B. Su.

**TOWHEE** [to'hi; tohwi'], any one of a number of species of American finches united in the genus *Pipilo.* They range from southern Canada to southern Mexico. The best known are the closely allied *P. erythrophthalmus* and *P. maculatus,* the former of the eastern United States, the latter restricted to the west coast region. These are both 8 in. long. Male towhees have the upper parts black, the flanks rufous, but the remaining under parts white, and white patches in the wings and tail; the females are similar but have the black replaced by brown. The most familiar species of the Pacific coast is the somewhat larger (9½ in.) brown towhee, *P. fuscus,* which is mainly dull gray-brown, but has the top of the head light rufous. Towhees spend much of their time on the ground in woods and thickets, where they scratch among the leaves for seeds and insects. The name towhee, as also chewink, is derived from the calls of certain species. H. G. De.

**TOWIE.** *See* Card Games.

**TOWN, ITHIEL** (1784-1844), American architect, was born at Thompson, Conn., Oct. 3, 1784. He studied architecture in Boston under Asher Benjamin. Most of Town's houses were built in the Greek Revival manner. His most famous church, the Center Congregational Church on the New Haven Green, was started in 1812. The old Connecticut Capitol, also on the Green and since demolished, was the first Greek Doric "temple" in New England. In 1826, Town started his New York architectural practice, first in partnership with Martin Thompson and then, from about 1829, with Alexander J. Davis. Town and Davis made a good working team, since Town had been a carpenter and Davis was a good draftsman. This prolific firm designed a number of state capitols, including the one still standing at Springfield, Ill. Town also became famous as the inventor of the Town truss, used on many wooden and iron bridges of the period. Town influenced the taste of the country profoundly through the use of the Greek Revival style. In this respect he rivaled Benjamin H. Latrobe, who introduced it in the United States. Town died in New Haven, Conn., on June 13, 1844. F. J. R.

**TOWN GOVERNMENT.** *See* Local Government in the United States.

**TOWNSEND PLAN,** a plan for old-age pensions proposed in 1934 by Francis Townsend of Long Beach, Calif. Designed not only to relieve the aged, but offered as a panacea for recovery from the depression, the plan called for: (1) a pension of $200 per month for every American citizen 60 years of age or older, on condition that such pension be spent in 30 days within the United States, and that its beneficiaries withdraw from all gainful occupation; (2) pensions to be financed by a 2 per cent tax on all business transactions.

Well publicized, the plan attracted thousands of adherents from all parts of the country. Bills embodying its features were introduced into the 74th Congress. The *Townsend National Weekly* was established, and national conventions, attended by thousands of supporters, met in Chicago and Cleveland in 1935 and 1936. At its peak, the movement claimed 2,500,000 members and 25,000,000 supporters. It was a political force to be reckoned with in many states. With the development of the national program for social security, after 1935, and the recovery of the nation from the depths of the depression, the popularity of the movement waned and in 1948 had lost most of its political significance. C. T. P.

**TOWNSHEND,** the name of a distinguished English family, the most prominent members of which were the following:

**Charles Townshend** (1674-1738). Charles Townshend, second Viscount Townshend, eldest son of Sir Horatio, first Viscount Townshend of Rainham, in Norfolk. He was educated at Eton and King's College, Cambridge, and succeeded to the peerage in 1687. Although brought up as a Tory, Townshend soon joined the Whigs and was one of the junto who upheld religious liberty against the Occasional Conformity bill. In 1709 he visited the Hague as ambassador to the States-General and negotiated the Barrier Treaty (1710), ratifying the Hanoverian succession, but in 1711 was recalled for having exceeded his instructions and was voted an enemy of his country. On the accession of George I in 1714, he was appointed secretary of state for the northern department, but in 1716, he was dismissed on a charge of having obstructed the French alliance and of scheming to place the prince of Wales on the throne. In 1721 he was restored to this office. Townshend was a valuable ally of Sir Robert Walpole but differences later arose between them, and in 1730 Townshend resigned from the government, retiring to his estate at Rainham, where he died, June 21, 1738.

**Charles Townshend** (1725-1767). Charles Townshend, grandson of the second Viscount Townshend, attended Leyden University and entered parliament as a member for Yarmouth in 1747. He became successively lord of the admiralty (1754), treasurer of the chamber (1756), and secretary of war (1761). In 1762 he resigned his office, but accepted the presidency of the board of trade. On the return of Pitt to power in 1766, Townshend became chancellor of the exchequer and the most powerful minister in the House of Commons. He opposed Chatham's India policy and was the author of those measures for obtaining revenue from the American colonies that more than any other grievance brought about the revolt of the colonies. It was Townshend who suspended the activities of the New York Assembly and obtained passage of the measure taxing glass, paper, and tea on importation into America. He died suddenly, Sept. 4, 1767.

**George Townshend** (1724-1807). George Townshend, fourth Viscount and first Marquis Townshend, was educated at St. John's College, Cambridge, and in 1745 joined the army under the Duke of Cumberland. He fought at Culloden (1746) and Laufeld (1747). He was the author of the Militia Bill of 1757 and aide-de-camp to George II. He was appointed brigadier-general under Wolfe, in the Quebec expedition, and on the latter's death at the battle of Abraham Heights took over the chief command in 1759 and received the capitulation of the city. In 1767 he was appointed lord-lieutenant of Ireland, and aroused violent hostility. He was recalled in 1772 and became master-general of the ordinance. He died at Rainham, Sept. 14, 1807. C. W. D.

**TOWNSHEND ACTS, THE.** *See* American Revolutionary Period.

**TOWNSVILLE,** a city and the second largest port of Queensland, northeastern Australia, situated on Halifax Bay in Elphinstone Co. It is on the coast of the Coral Sea, and the Sea View Mountain Range is west of the city. Townsville has a tropical savanna type of climate, with high mean temperatures and between 50 and 70 in. of rain annually. Sugar is an important crop of the vicnity. Townsville was founded in 1864 by John Medwin Black, who named it after his partner, Captain Towns. It attained municipality status in 1866 and is the seat of the Anglican bishopric of North Queensland. The harbor is a regular port of call for both coastwise and overseas steamers, handling over 1,000,000 tons of freight a year. Townsville is also an important railway terminus. Pop. (off. est. 1947), 34,233. J. E. F.

**TOYAMA** [toyɑmɑ], the capital of Toyama Prefecture, on the western coast of Honshu Island, Japan. The city is situated just inland from Toyama Bay near the mouth of the Jintsu River in a noted rice-producing region. Like other cities of western Honshu, it has cold, wet winters, with a heavy snowfall. The summers are mild. Toyama's chief industries are cotton spinning and the manufacture of proprietary drugs, a business which began as early as 1680 and grew until thousands were employed in it. Leather goods,

wood pulp, and nitro-lime are also produced. Toyama University is in the city. Pop. 1950, 154,484.

**TOY DOG.** *See* Dog.
**TOYDON.** *See* Christmas Berry.

**TOYNBEE, ARNOLD JOSEPH** [tɔi'nbi] (1889- ), English historian, was born in London, Apr. 14, 1889, and educated at Winchester and at Balliol College, Oxford. From 1912 to 1915 he was a fellow and tutor of Balliol College, and in 1919 he was appointed professor of Byzantine and modern Greek language, literature, and history at London University. He resigned this post in 1924 to become director of studies in the Royal Institute of International Affairs; he is also research professor of international history in the University of London. Toynbee's outstanding work is his philosophical

**TRACHINIAE** [trəkɪ'nɪi] (*The Women of Trachis*), a tragedy by Sophocles possibly written between 421 and 408 B.C. It tells the story of Deianira's fateful attempt to win back the love of her husband, the great hero Heracles, by sending him a robe which she had saturated with what she thought was a magic love potion but which was in reality a deadly poison given her under false pretenses by the vengeful centaur Nessus. The tragic outcome is her suicide and Heracles' agonized death. S. D. At.

**TRACHOMA.** *See* Eye (*Eye Diseases*).

**TRACHYTE** [tre'kait; træ'kait], a dense igneous rock that is considered to be the volcanic equivalent of syenite. It is composed chiefly of feldspar with lesser amounts of dark-colored minerals, such as hornblende, biotite, and, more rarely, pyroxene. Quartz is absent. The feldspar is mainly one of the potash types, with plagioclase and oligoclase less abundant. Phenocrysts, especially of feldspar, are so common that many trachytes are better described as trachyte porphyries. Carlsbad twinning may be recognizable in the large feldspar phenocrysts. Trachyte occurs in lava flows; the rock is often streaked due to consolidation while the lava was still in motion. Best known localities for trachyte are in Germany and Italy, but the rock is also found in the United States in the Black Hills of the Dakotas, in Colorado, in Missouri, and, in dikes, in the vicinity of Lake Champlain in New York. K. K. L.

**TRACK AND FIELD SPORTS,** a group of athletic contests involving the basic physical activities of walking, running, jumping, throwing, pushing, and pulling.

**Events.** The annual outdoor national championships of the Amateur Athletic Union, the track and field championships of the United States, include, in Olympic years, competition in the following events: 100-, 200-, 400-, 800-, 1,500-, 5,000-, and 10,000-meter runs; 110-, 200-, and 400-meter hurdles; 3,000-meter steeplechase; 3,000-meter walk; broad jump; high jump; pole vault; hop-step-and-jump; discus throw; javelin throw; 16-lb. shot put; 16-lb. hammer throw; and 56-lb. weight throw. (In non-Olympic years, British-measure equivalents are substituted for metric distances, as, for example, 1, 2, 3, and 6 miles for 1,500, 3,000, 5,000, and 10,000 meters.) Olympic track and field competition includes all of these events except the 200-meter hurdles, the 3,000-meter walk, and the 56-lb. weight throw, and adds the 10,000- and 50,000-meter walks, the marathon run (26 mi., 385 yd., or 42,000 meters), the 400- and 1,600-meter relays, and the decathlon.

Except for the A.A.U. outdoor championships in Olympic years, American track and field meets do not as a rule use the metric system. Outdoor high-school meets generally include most or all of the following events: 100-, 220-, 440-, and 880-yd. and 1-mi. runs; 120-, 180-, and 220-yd. hurdles; half-mile, mile, or medley relays; 12-lb. shot put; discus throw; javelin throw; high jump; broad jump; and pole vault. Outdoor meets at the collegiate or later level generally include all of these except the 180-yd. hurdles, the 12-lb. shot put, and, except in relay "carnivals," the half-mile and medley relays (although a medley relay is sometimes retained for college freshmen), and add the 16-lb. shot put and the 2-mi. run. The 16-lb. hammer throw and the 35- or 56-lb. weight throw are also included at times. A ¾-mi. event is run occasionally.

Indoor meets follow the same pattern, with certain exceptions. Sprint and hurdle events are held at shorter distances, usually 60 yd. Races at 600 and 1,000 yd. often replace or supplement the 440 and 880. Javelin, discus, and hammer throws are seldom held indoors.

Outdoor championships are also sponsored by the A.A.U. in road races at 10, 15, 20, 25, and 30 kilometers, in the marathon, in walking races, in relays, and in cross-country runs. Colleges and schools also sponsor cross-country runs.

**Tracks.** Except for road races and cross-country runs, most outdoor races take place on an oval track, made usually of a composition of finely crushed cinders and other materials. Most outdoor tracks in the United States measure 440 yd., 1 ft. in from the inner circumference. Indoor tracks are most often made of wood, are banked at the curves, and are much smaller than outdoor tracks, seldom measuring more than 220 yd., and frequently less.

**Scoring.** Meets are scored according to the number of teams or individuals competing; the larger the meet, the more places in each event count in the scoring. When three

places are counted, scoring is usually 5, 3, and 1, respectively, for the first three places. Four places are usually scored 5, 3, 2, and 1. Five places are usually scored 5, 4, 3, 2, and 1. In very large or very important meets, six places are sometimes counted; scoring may be 10, 8, 6, 4, 2, and 1, or 10, 5, 4, 3, 2, and 1. The team gaining most points in all events is the winner, although in England and elsewhere only first places count in team scores at times.

## SPRINTING AND RUNNING

The ancient Persians, Greeks, and Romans trained their soldiery in running as an important part of military preparation, and between wars, running became a sport. Like other sports, it declined during the Middle Ages, although still a part of military training. Running as a sport was revived during the nineteenth century, and interest in it was intensified with the revival of the Olympic Games in 1896.

Flat running events are usually classified either as sprints, middle distances, or long distances, although there is no universally accepted criterion and some events are classified differently at different times and occasions.

Sprints are short races, sometimes called dashes. The term usually applies to those races shorter than 440 yd. The runners start from a "crouch" start, with legs tense, from which they spring forward rapidly into full running motion. The sprints are run at full speed for their entire distance. Probably the greatest of all sprinters was the American, Jesse Owens, who won four gold medals at the 1936 Olympic Games.

Middle-distance events are those between the 440-yd. run and the 1-mi. run. The 440 and equivalent races are really extended sprints, with the runners going full speed from start to finish. In the 880 and mile, and comparative distances, the runners endeavor to pace themselves according to plan, running a little faster or slower at certain portions of the race to achieve maximum results for the race as a whole. Frequently, great runners are equally at home in two or more middle-distance events. Ted Meredith, Ben Eastman, John Woodruff, and Mal Whitfield could run brilliantly in both the 440 and 880. Mel Sheppard and Sidney Wooderson were great runners at both the mile and half mile. Bill Carr, on the other hand, specialized in the 440, and Roger Bannister, first to run a mile in less than four minutes, usually concentrated on the mile.

Long-distance races are all those events longer than the mile. Great runners at these longer races are often capable of exceptional performances at widely disparate distances. Emil Zatopek, the Czechoslovakian distance runner who won three events at the 1952 Olympics, was equally good at 3 mi. and 26 mi. Paavo Nurmi, the Finnish star of the 1920's, held world's records at distances from 1 mi. to 10 mi. Gunder Haegg, the Swedish runner whose great career reached its peak during World War II when the Olympic Games were not held, broke world records with seeming ease at distances from 1,500 to 5,000 meters.

*Relay Races.* Relay races are those in which four contestants, comprising a team, run separate, consecutive "legs." A small baton is carried from start to finish by the successive members of the team; if it is dropped it must be retrieved. The most popular American relay distances are 1 mi. (four equal legs of 440 yd.) and 2 mi. (four equal legs of 880 yd.). Other relay distances are a quarter mile, a half mile and 4 mi. Medley relays are those in which four legs of varying distances are run (example: 880 yd., 440 yd., 220 yd., 1 mi.). Track meets specializing in relay races, such as the Penn Relays and Drake Relays, are held annually.

INTERNATIONAL NEWS

*Competitors crossing the brook during the annual Eton steeplechase in Buckinghamshire, England*

## CROSS-COUNTRY AND STEEPLECHASE

The earliest cross-country race was the famous "Crick Run" at Rugby School in England, first held in 1837. This cross-country chase, with its hedges, streams, hills, and rough terrain, was in many ways the forerunner of the modern steeplechase, as well as of modern cross-country competition. Cross-country running on a national championship basis was begun in England in 1876. Cross-country races have been a part of every modern Olympic renewal, but only in the sense that the 26-mi. marathon is run over the roads and lanes of the countryside. True cross-country runs were held only in the 1912, 1920, and 1924 games.

A.A.U. rules governing cross-country running in the United States provide that the race can be started and finished on a regular track, but that the major part of the run should be over the countryside on a properly surveyed course, marked with flags (red to the left and white to the right) that can be seen at a distance of 125 yd. Cross-country runs are held regularly in the United States, usually during the autumn, and are sponsored by collegiate or scholastic conferences, or similar groups. Team championships are determined on a point basis; the first five runners to finish from each team are given points corresponding to the place in which they finish (first place, 1; second, 2; and so on), and the team with the lowest total score wins.

The steeplechase is an obstacle race. No official records are listed for steeplechase events, since no two steeplechase courses are exactly alike. The 3,000-meter steeplechase is the standard distance. Conducted on a 400-meter (equivalent to 440 yd.) track, the standard steeplechase includes five jumps to each lap, 80 meters apart. The jumps are wooden hurdles, about 3 ft. high and 12 ft. wide, and heavy enough not to be easily upset; some jumps include water pools.

## WALKING

Walking races, held at distances from 1 mi. to more than 30 mi., are those in which the contestants at no time lose contact with the ground. Losing contact is called running and is a violation for which the contestant can be disqualified. Developing speed within the restriction of ground contact has resulted in a peculiar gait in which the heel of the forward foot strikes the ground just before the toe of the rear foot leaves it. The legs at this point are perfectly straight. Walking has been called the "heel and toe" sport. A good walker can cover a mile in less than 7 min. Walking races were very popular in England during the nineteenth century, and retain their popularity in various parts of Europe. Most

great walkers today are European. Once a common American pastime, walking races are relatively rare today in the United States; only the existence of the A.A.U. and Olympic walking championships keeps interest alive.

### HURDLING

Hurdling is a foot race, related to the steeplechase, in which the runner must leap over several low wooden barriers in the course of the race. Hurdling races are short: the longest is 400 meters (or 440 yd.). More common in the United States are the 120-yd. high and 220-yd. low hurdles. Indoor hurdle races are at shorter distances. Hurdle heights are: 110 meter (or 120 yd.), 3 ft., 6 in.; 200 meter (or 220 yd.), 2 ft., 6 in.; 400 meter (or 440 yd.), 3 ft.

Modern hurdling style calls for the runner to race directly at the hurdle, jump over it with a long, extended stride, and clear it in such a manner that he is able to snap his lead foot down to the ground quickly in order to resume running speed as rapidly as possible. The high hurdles are the truest hurdles test. Good sprinters can often turn in first-class performances in the low hurdles. Alvin Kraenzlein, Forrest Towns, Fred Wolcott, and Harrison Dillard were outstanding in both low- and high-hurdle competition.

*Contestant going over the bar in a high jump*

### JUMPING

**High Jump.** In high jumping, the athlete jumps over a horizontal crossbar suspended between two upright poles. It is properly divided into the running high jump and the standing high jump, although the latter event, once very popular and for years a part of the Olympic program, is no longer included in regular track and field competition. Unlike the standing high jump, in which the jumper propels himself over the bar from a standing position, the running high jump permits the contestant to run towards the crossbar from any direction and at any speed, and thus gain added momentum before he propels himself upward from the ground. The most successful method of jumping is the Western layout, or "Western roll," in which the jumper, running at moderate speed, approaches the crossbar at a 45° angle, springs upward from the leg nearest the bar, turns the front of his body toward the bar as the length of his body "rolls" over it, and lands on his hands and knees. The jump is measured from the ground to the central point of the crossbar. Phenomenal results in high jumping were achieved by Lester Steers, an American, whose heavy, muscular physique contrasted sharply with the slighter stature of other jumpers. He is said to have jumped over 7 ft. in practice.

**Broad Jump.** Jumping for distance is one of the oldest track and field events, and was included in the ancient Greek games. The once-popular standing broad jump, an Olympic event for many years, is seldom held today, but the running broad jump is held in most meets. The contestant races down a narrow cinder runway in such a manner that he touches the takeoff board at the end of the runway with his leaping foot while running at top speed. From the takeoff board, which is 8 in. wide and set flush with the ground, he propels himself through the air and lands in a specially prepared pit. The jump is measured at right angles from the edge of the board nearest the pit to the nearest point from that line touched by the body or clothing of the jumper.

Leaps of over 25 ft. are common. Most great broad jumpers are sprinters who take advantage of their great speed to gain momentum for their leap. The greatest of all broad jumpers, Jesse Owens, also set world records in the sprints.

**Hop, Step, and Jump.** The running hop, step, and jump is an event seldom seen in the United States except for A.A.U. and Olympic competition, although it has a long tradition and is said to have been extremely popular in Ireland during the 19th century. It is similar to the running broad jump in runway, jumping pit, method of approach, and measurement, and in the fact that sprinters usually excel at it; it is different in that distances achieved often exceed 50 ft. At the end of his approach run, the contestant leaps off one foot, lands on that foot, takes a long step to the other foot, and then jumps as in the broad jump. The United States has not won this event at the Olympics since 1904. A standing hop, step, and jump was once an Olympic event.

JACK FRANK—HERALD TRIBUNE

*POLE VAULT*

**Pole Vault.** Pole vaulting is derived, it is believed, from an early English custom of vaulting across narrow streams with the aid of a long stick. Vaulting for distance became a common sport, to be succeeded in time by vaulting for height. The modern pole vault combines elements of the broad jump and the high jump, and adds its own distinctive element, the pole. The contestant, carrying a long pole of bamboo, aluminum, or some other strong, light material, races down a narrow runway at top speed, thrusts the pole into a wooden slot set in the ground beneath the crossbar, and with the aid of the pole and the momentum gained from the run lifts his body up and over the crossbar.

The greatest of all pole vaulters was Cornelius Warmerdam, an American, who vaulted 15 ft. or higher consistently at a period when no other vaulter could reach the 15-ft. height. It was more than ten years after Warmerdam's first 15-ft. vault before another athlete, the Reverend Robert Richards, was able to reach that height.

## THROWING

**Discus Throw.** Throwing the discus, a flat, platter-like disk, is one of the traditional events, surviving pieces of Greek statuary indicating that it was a popular sport in ancient Greece. Such statuary indicates that the Greek discus thrower threw the discus with a straight, forward, underhand motion. A similar style was used in modern discus throwing until just before 1900, and apparently never produced a throw of much over 100 ft. Around 1900 the use of a preliminary turn to gain momentum was introduced, and the athlete was allowed to move about within a 7-ft. circle. Later, the circle was enlarged to 8 ft., 2½ in. Performances improved rapidly after the introduction of the preliminary spin within the circle, and records today approach 200 ft.

The modern discus is made of wood encircled by a metal rim, and inset with a brass plate in its exact center. The diameter of the discus is at least 8⅝″, and its weight at least 4 lb., 6.4 oz. The discus must be thrown in a specified 90° sector, and the distance of the throw is the distance from the nearest point of the circle to the nearest point on the ground touched by the discus on landing.

Although his records can not compare with present-day marks, Martin J. Sheridan of the United States, who competed in the early 1900's, must be considered one of the greatest of all discus throwers. He won three Olympic titles and held a succession of world records for a decade.

**Hammer Throw.** It is thought that hammer throwing began in Ireland, where laborers in friendly competition with one another, strove to see which could throw the large sledge hammers they worked with the furthest distance. Later, the pastime developed into an organized event, and the hammer evolved from an angular metal head on a rigid wooden handle into today's round metal ball suspended at the end of a steel wire, with a loop for the contestant to grip with both hands at the other end. The ball, with handle, must weight 16 lb., and the overall length must not exceed 4 ft. The hammer is thrown from a circle that has been reduced in diameter through the years to its present 7 ft.

The contestant stands in the circle, swings the hammer around his head and shoulders several times, and then turns his body with the swing of the hammer two or three times to gain maximum centrifugal force before releasing the weight. The ball must fall within an indicated 90° sector.

The "Golden Age" of hammer throwing in the United States was the early 1900's, when the famous "Irish whales," big, strapping Irish-Americans like John J. Flanagan, Matthew J. McGrath, and Patrick J. Ryan took turns holding the world record and winning the Olympic title. In recent years European athletes have dominated the event.

**Weight Throw.** In weight throwing, the contestant lifts and throws a standard-sized weight, usually for distance, although in the past some weight-throwing contests were held in which the weight was thrown for height over a crossbar. The origin of weight throwing is obscure, but it has been determined that a form of weight throwing was a sporting event in Ireland before the Christian era. Today, it is held occasionally, usually only in large championship meets. It is no longer an Olympic event.

Two sizes of weights are used in modern competition, one of 35 lb., the other of 56 lb., both weights including the handle. The weight itself is a metal ball to which is attached the point of a triangular metal handle. The weight

is thrown from within a 7-ft. circle, and must land in an indicated 90° sector. The contestant stands with his back in the direction he will throw, holds the weight by the handle with both hands, and swings it a few times in front of him to gain momentum. He then makes one swift, complete turn of his body, swinging the weight around and up over his shoulder, where he releases it. As in the hammer throw, the peak of weight-throwing activity in the United States was in the early twentieth century.

**Javelin Throw.** The javelin throw has its origin in the hurling of a spear in primitive warfare or hunting. The javelin used in modern contests is a light wooden shaft with a metal point; all-metal javelins have been allowed in some meets. The javelin must be at least 8½ ft. long and must weigh at least 1¾ lb. At the center of gravity, which is forward of the middle point of the javelin, there is a grip of tightly wound cord. The contestant holds the javelin by the grip and runs rapidly up to a line, behind which, however, he must release the shaft. If the javelin breaks in mid-air, the throw does not count. In a good throw, the point of the javelin must strike the ground before any other part. The greatest javelin throwers in modern track and field competition have usually been Finnish or American. Marks of well over 250 ft. have been achieved.

*Champion javelin thrower in full action*

**Shot Put.** In putting the shot, the athlete stands within a 7-ft. circle, holds a heavy weight in one hand, and propels it outward through the air. The distance of the put is measured from the circle to the nearest point the shot touches as it falls. The sport is probably derived from simple stone-throwing contests. The modern event came from Ireland and Scotland, and is a traditional part of the track and field scene. The modern shot is a metal ball weighing 8, 12, or 16 lb. The 8-lb. shot is rarely used, except in women's competition; the 12-lb. shot is standard in high-school meets; the 16-lb. shot is the size used in most meets above the high-school level, including the Olympic Games.

In putting the shot, the contestant holds the shot against his shoulder or neck, keeping it from going behind or below the shoulder. He springs forward off his rear leg and simultaneously leaping and straightening his legs, trunk, and arm, thrusts the shot forward. Because of the complicated motions of the legs, trunk, and arms, excellent co-ordination is required of the championship shot putter.

Americans have always been outstanding in this event. In 1909 Ralph Rose, an American, became the first to put the shot over 50 ft. In 1954 Parry O'Brien, another American, became the first to exceed 60 ft.

### DECATHLON

The decathlon is a 10-event program for individuals, generally held over a two-day period, with the contestant compiling the best point score for all 10 events declared the winner. The events are the 100-, 400-, and 1,500-meter runs; the 110-meter hurdles; the shot put; the discus throw; the javelin throw; the broad jump; the high jump; and the pole vault.

INTERNATIONAL NEWS PHOTO

*PUTTING THE SHOT*

A norm is established for each event for which a value of 1,000 points is given. An individual's score in each event is based on a comparison of his time or distance with that of the norm, and points are assigned accordingly.

One of the most strenuous of all athletic endeavors, the decathlon is seldom held except for national or Olympic championships. It is nevertheless one of the most respected of all athletic contests. Jim Thorpe, the American Indian athlete, won the Olympic decathlon with a great performance in 1912, only to have his title taken from him later on when charges against him of professionalism were upheld. The only other athlete to compare with Thorpe in the decathlon was another American, Bob Mathias, who won the Olympic decathlon in 1948 and 1952, and the American national decathlon championship four times. *See also* Olympic Games.

**TRACTARIAN MOVEMENT,** a name sometimes given to the Oxford Movement, a religious revival in the 1840's in the Church of England. The name is derived from *Tracts for the Times,* published by leaders of the movement between 1833 and 1841. *See also* Oxford Movement.

**TRACTION, ELECTRIC.** *See* Electric Traction.

**TRACTOR.** *See* Farm Machinery; Motor Vehicles.

**TRADE AGREEMENTS, INTERNATIONAL.** *See* International Loans and Agreements.

**TRADE AND EXCHANGE IN THE U.S.** Commerce arises mainly from regional economic differences. Such differences between the Orient and Europe, first fully realized in the late Middle Ages, stimulated a search for an easier route to the Orient, and this search disclosed the New World as a rich source of precious metals to replenish the depleted European stocks. A lively trade began between the Old and New Worlds, natural wealth moving eastward in exchange for manufactured goods moving in the opposite direction. Coastwise trading also developed between the northern colonies and those along the southern shore of North America and in the West Indies, based on product variety due to climatic differences. At first there was little domestic commerce. Naturally inclined toward self-sufficiency and hampered by lack of currency and of decent inland transportation, the colonists limited their local trading to the veriest essentials.

**Commercial Development of the United States.** The American Revolution (1775-1781), the Napoleonic Wars, and the War of 1812 seriously interfered with both overseas and coastwise trade. The United States was forced to rely largely on its own resources. Westward movement across the mountains, both in the north and in the south, opened up new regions whose products and needs were different from those of the settled areas along the eastern seaboard. For a time industry continued to be local. Grist mills, forge shops, tanneries, and the like were situated close to their raw materials and sold their products only in the immediate neighborhood. Agriculture was fairly general in character and was carried on largely for the pioneer farmer's own consumption. As trade developed, industries became more centralized and specialized, while markets broadened and the standard of living increased. Foreign trade also increased, although it failed to keep pace with the rise in domestic trade. In addition, the young nation was more dependent on imports of European manufactures than were foreign markets on agricultural products which constituted its only exportable surpluses. In consequence, its private financial debt to foreigners increased. It also experimented with protective tariffs as a means of fostering domestic industry.

*Industrial Growth.* The Civil War (1861-1865) had dramatic impact on the economic, as well as the political and social, life of the nation. The war induced a series of currency and price convulsions, but in its wake there followed great improvement of transportation, financial, and trade facilities. Development of the railway network, of the National Banking System, and of public trading in corporate securities during the last four decades of the nineteenth century accelerated the rate of industrialization, wove the country's myriad threads of economic power into the fabric of one vast market and stimulated unprecedented growth of domestic trade. Development of electric power, mass production techniques, and automotive transport brought it to the forefront in both agriculture and manufacture. Introduction of the Federal Reserve System in 1913 markedly improved the country's currency and credit facilities, although the financing of World War I (1914-1918) expenditures brought on inflation which later bore bitter fruit. A primary postwar recession was followed by eight years of industrial and commercial prosperity in which the credit policy of the new banking system prevented commodity prices from getting out of hand. In the later stage of this period, however, stock speculation got beyond the control of the Federal Reserve System and culminated in three years of collapse into abysmal depression. Price deflation and trade stagnation brought on reform of the money system, of banking practice, and of trading in securities. Federal regulation became a dominant policy.

*Effect of World War II.* American exports during World War I had been so great that the nation's international financial position shifted from that of debtor to that of creditor. The first demands of Great Britain and France in World War II revived trade in 1939. As the United States gradually increased its participation in the conflict and finally became a full-fledged belligerent in 1941, agricultural and industrial production soared. Trade volume, both domestic and foreign, increased rapidly and its commodity pattern changed as the nation mobilized for total war. The government's astronomical expenditures were financed in a manner somewhat less inflationary than in the preceding war. Such inflationary pressure as did bear on commodity prices was held in check by price control and rationing of both producers' and consumers' goods. With the close of the war in 1945 and relaxation of government controls, both domestic and foreign trade volume rose to new heights, and prices began a steep ascent, reaching a plateau in 1954.

### PRICES

Under a strict barter system the value of a good could be fully expressed only by citing the quantities of each and every other good for which the first good might be exchanged. It may thus be appreciated that a medium of exchange enormously simplifies the whole process of valuation. Whether or not money actually changes hands in the act of trading, the monetary unit acts as a common denominator, and the value of a good expressed in terms of money is called its price. Price is such a familiar concept that its meaning might seem too obvious to merit comment. Yet any discussion of this most significant phenomenon in the process of trade and exchange is faced at the outset with certain difficulties which must be cleanly disposed of if confusion is to be avoided. One might cite the price of a certain good as $20,000. If the good were, say, an indivisible and unique object such as a statue, this would be the most convenient way to express its price. If, on the other hand, the good were a 100-acre tract of land, the price might be more significantly expressed as $200 per acre. With some goods, furthermore, price is conventionally expressed the other way around, as so many yards or ounces or other physical unit per dollar. These difficulties and other similar ones are trifling when individual transactions alone are under consideration. Misunderstanding can be avoided by the simple expedient of stating the terms of trade clearly. When it is necessary, however, as in making historical comparisons, to contemplate whole masses of transactions in many goods in many markets at different times, price representatives must be devised statistically with care to insure internal consistency and external comparability. Construction of such representatives are called price index numbers.

**Historical Price Comparisons.** Historical price comparisons are of two types. The first has to do with general movements of prices to a higher or lower level. Such movements may continue gradually through many years but are usually moderated by shorter cyclical movements and sometimes interrupted by sharp gyrations. They manifest changes in the value or purchasing power of money, in the relation between debtors and creditors, and often in the character

of commercial activity. The second, nearly always closely related to the first, deals with changes in the internal structure of prices; that is, in the relations between the prices of different goods. Such changes bear directly upon the distribution of income and upon the allocation of resources to different lines of production. Wages are the price of labor, rent the price of the use of land, and interest the price of the use of capital. Pure profit, the share of the entrepreneur, and taxes, the share of government, are not prices, since neither is proportioned to the goods or services given in exchange. This article deals with certain important samples such as wholesale commodity prices, the cost of living, security prices, and selected interest rates; for these there exist reliable data covering a considerable period of years.

**Wholesale Commodity Prices.** *Pre-Civil War Period.* The first major convulsion of commodity prices followed the expiration of the Bank of the United States' charter in 1811. Overissuance of notes by state banks and unsound government financing of the War of 1812 sent wholesale prices soaring 50 per cent. A crisis occurred shortly after the close of the war early in 1815, and within a few months prices fell back to the prewar level. American manufactures, which had been protected by the embargo, were again exposed to foreign competition. Effective tariff protection was given only to the textile and iron industries. The continuing currency inflation affected principally the value of bank stocks and real estate. Commodity prices generally failed to rally, and when the Cheves administration of the Second United States Bank began deflating the currency in 1819, they resumed their decline. Thus began a long downward trend. Brief upward flurries during the early 1830's invariably gave way to recession. That commodity prices did not break early in the 1837 depression was attributable to loans of gold and silver from British banks which made it possible for commodity speculators (including the Second Bank of the United States, then operating as a private institution under a Pennsylvania charter) to maintain their unsound positions. When these loans were called in 1839, wholesale prices immediately slumped. In 1849 they reached a bottom 62 per cent below the 1814 peak and 43 per cent below the 1812 level. After the California gold discovery the inflow of precious metal provided a large increase in the reserve for paper money and sent prices sharply upward in 1853. Precipitated by a banking crisis in New York State, however, a recession developed in 1857, taking prices back to the earlier level, where they stayed through 1860.

*Civil War and Reconstruction Period.* During the Civil War the huge military demand for a wide range of commodities and the government's inflationary financial policy caused wholesale prices to mount rapidly. In the immediate aftermath of the war national bank notes, backed by fractional reserves of greenbacks, added to the inflationary spiral. Altogether, prices rose 114 per cent from 1860 to the peak in 1865. A sharp setback occurred in 1882 and another in 1885. Agricultural commodity prices in particular were deeply depressed, and grotesque maladjustments developed within the price structure. Kansas farmers burned their corn in preference to wood or coal because the corn was cheaper. Another peculiarity about the latter half of the 1880's was that, while there was considerable resurgence of business prosperity, commodity prices in general did not appreciably rise, and many individual prices continued inexorably to decline into the depression of 1890-1891. A brief rally, prompted by the effects of the McKinley Tariff Act and the Sherman Silver Purchase Act, was wiped out as the country experienced a panic in 1893. Repeal of the Sherman Act had a depressive effect, and the threat of the free-silver advocates to pass another act led to a heavy drain on the country's gold reserves. In 1896 wholesale prices finally reached their nadir, 67 per cent below the 1865 peak and 27 per cent below the 1860 level.

*Beginning of Recovery.* In 1897 a good wheat crop in the United States, with poor crops abroad, made possible large exports at high prices. Agricultural prices in general turned upward and carried with them the prices of foods. Those of textiles, fuels, metals, and building materials, on the other hand, fell off slightly. By 1900 a general upward movement of prices clearly was under way except among the metals, which were receding from a high point produced by the demands of the Spanish-American War.

The rising trend was very moderate, but it persisted, being interrupted only slightly by the financial panics of 1903 and 1907. Throughout the entire period from 1896 to 1914, indeed, the only important price fluctuations were in securities and real estate, rather than in commodities.

*World War I Inflation.* The outbreak of World War I in Europe was not significantly reflected in United States commodity prices for some time. Even as late as 1916 the only sharp increases were in the fuels and metals. In 1917, however, the effects of military demands and inflationary financing began to be clearly felt in the commodities markets. Farm product prices rose most steeply, carrying food prices along with them. Among industrial products the metals, fuels, and textiles registered the sharpest advances. The year 1918 saw a continuation of rapid increase in farm-product prices, but food prices rose more moderately. Of other leading commodity prices only those of the textiles continued to soar, while those of the metals actually dropped with some abruptness. In 1919, the first year after the close of hostilities, textile and fuel prices fell off somewhat, and those of the metals continued their decline. Farm-product and food prices rose moderately. A resurgence of peacetime demands sent the prices of building materials up sharply. Agricultural-product prices turned downward in 1920, and other prices probably would have followed suit but for certain measures taken by the government, ostensibly to facilitate reconstruction in Europe and advancement of foreign trade, but at least equally motivated by the hope of forestalling dread deflation, depression, and unemployment. New loans were extended to European countries. The merchant shipbuilding program begun during the war was continued. Leftover stores of merchandise, which had been purchased as military supplies, were locked up in storehouses rather than dumped on the market. To finance these measures the government continued to borrow heavily, and the Federal Reserve System maintained artificially low interest rates in order to facilitate flotation of the bond issues. As a result, practically all industrial commodity prices leaped rapidly upward, the fuels, house furnishings, and building materials leading the advance. Some indication of the distortions and strains which wartime and postwar inflation produced in the internal structure of prices is given by the following percentages of 1915-1920 increase: all commodities, 122 per cent; all farm products, 120 per cent; all industrial products, 132 per cent; foods, 111 per cent; textiles, 205 per cent; fuels, 215 per cent; metals and metal products, 73 per cent; building materials, 182 per cent; house furnishings, 154 per cent.

*Readjustment and Recession.* The expedients intended to avoid inflation merely postponed the evil day. When prices finally broke at the end of 1920 the drop was precipitous, the 1921 decline for all commodities averaging 38 per cent. Deflation brought some readjustment of price relationships,

the largest declines being registered in those commodities whose prices had risen most in the inflation; but the realignment was by no means complete. During the next eight years a moderate amount of general prosperity was punctuated by mild recession in 1924 and 1927. Wholesale prices moved irregularly without pronounced trend either upward or downward. Farm-product and food prices were slightly higher in 1929 than in 1921, but those of practically all other important products were a little lower. The prosperity of the twenties, manifested in the 1928-1929 boom and the New Era philosophy, was largely a financial phenomenon not reflected in commodity prices. The three-year business recession which began in mid-1929, however, was reflected in a rather steep decline of commodity prices. For most commodities the slump was fairly even and regular, although house furnishings fell off only a little, and building materials actually rose slightly, during the first year. For all commodities taken together the three-year descent of wholesale prices amounted to about one third. The 1932 low point was 58 per cent below the 1920 peak and 7 per cent below the prewar level. Although the 1929-1932 episode was merely a final reaction to World War I inflation, its impact on the various commodities not only differed widely but also failed to compensate for the differences in impact of earlier phases.

Ascent from the 1932 low point was at first slow and irregular. As a result of the government's agricultural program, the prices of farm products and of foods began to increase rapidly in 1934 and 1935, but the rise tapered off in the next two years. During the same period industrial-product prices continued to ascend irregularly and more slowly. A recession in the latter part of 1937 brought about a sharp setback in the prices of farm products and of foods. In other commodities the preceding rise had been less pronounced, and the reaction was milder.

*Effect of World War II.* The outbreak of World War II in Europe did not immediately have any great effect on American wholesale prices. After 1940, however, farm-product and food prices soared almost as steeply as in the corresponding 1917-1918 period. Other commodity prices also rose, but somewhat more moderately. The fundamental causes of these price increases, of course, lay in the astronomical demands for commodities to supply both our own rapidly expanding military forces and our allies under Lend-Lease, and in the inflationary manner by which the government financed its purchases for these purposes. Governmental controls of prices and consumption began to take effect on industrial products, except foods, late in 1942 and on farm products and foods late in 1943. It is clear that the 1940-1946 over-all increase was about 54 per cent. While this was less than in the preceding war, the dispersion of impact on particular commodity groups was at least as great, as is indicated by the following figures: all farm products, 120 per cent; all industrial products, 43 per cent; foods, 82 per cent; textiles, 58 per cent; fuels, 26 per cent; metals and metal products, 21 per cent; building materials, 40 per cent; house furnishings, 26 per cent. During the early part of 1947, furthermore, the wholesale prices of all commodities and of farm products, foods, and building materials, in particular, continued to rise steeply. This rise continued until 1954, by the end of which year the wholesale prices of all commodities were 10 per cent above the 1947-1949 average. However, farm products and textile prices had begun to decline and were 3 per cent below that average.

**Cost of Living.** The modern concept of the cost of living is a composite of the retail prices of food, clothing, fuel, household furnishings, and the like, weighted by the proportions which these elements constitute in the budget of some "typical" family, usually one of low income. Reliable index numbers of the cost of living thus conceived do not date far back into American history. Lack of such indexes for earlier periods, however, is not particularly serious, because they would be of doubtful value in any event. With the growth of cities and towns in the United States, a steadily growing proportion of the population became increasingly dependent, and aware of its increasing dependence, on the prices of necessity goods. In the inflation of World War I and its immediate aftermath, living costs rose about 98 per cent. Popular cartoons personified "Old Man H.C.L." (high cost of living), and his villainy became the subject of bitter jests. In 1921 the cost of living fell back about one-ninth from the 1920 peak and remained at about that level, with little variation, through 1929. In the recession which followed, it declined to a low point in 1933, about 35 per cent below the 1920 peak, but 28 per cent above the prewar level. It increased very slightly during the 1930's. In the early part of World War II it began to ascend almost as steeply as in the corresponding period of the preceding war, the 1940-1943 increase being about 23 per cent. Government price control and rationing then held it fairly steady until the close of hostilities. When wartime controls were relaxed, another rapid rise began. The cost of living was 43 per cent above the 1940 level in 1946. In the latter part of 1948 and throughout 1949, there was a gradual decline, but in 1950, with the outbreak of the Korean War, the cost of living began to rise again, reaching a peak 15 per cent higher than the 1947-1949 average early in 1954.

**Stock and Bond Prices.** The prices of corporate securities first began to assume some significance in the economic scene after the Civil War. Prior to that time there had been a certain amount of public trading in bonds of the Federal government and of state-sponsored internal improvements, and even in bank stocks, in a small way, on the organized exchange in New York City. It was not until the era of large-scale railroad construction and finance, however that fluctuations in the prices of corporate securities became a noticeable factor in commercial affairs. Railroad stock and bond prices played some part, though minor, in the events leading up to the crises of 1873 and 1884 and in the recessions which followed.

During the last quarter of the nineteenth century bond prices followed a generally upward trend, with little variation. This trend was popularly regarded as the natural result of declining commodity prices. Stock prices, on the other hand, exhibited a slight downward tendency, commonly attributed to the same declining trend of commodity prices. More important than this long-run trend, however, was the inclination of stock prices to fluctuate over a wider range than bond prices. Stock prices, for example, passed through great cycles of ascent and descent in the periods 1877-1885 and 1886-1893. These movements reflected the susceptibility of ownership shares to the influence of cyclical change in business activity.

*Swing Toward Speculative Issues.* Toward the end of the nineteenth century security buyers began to turn away from high-grade, low-yielding railroad bonds and to show a preference for more speculative securities which, if fortune favored, might produce a larger return. Demand increased for stocks, industrial bonds, and second-grade railroad bonds. The high-grade bond price trend did not turn definitely downward until after the 1903 recession, but stock prices began to move steadily upward as early as 1897. The upturn of commodity prices, the settlement of the silver issue, the cor-

porate consolidation movement, and the influx of gold from Alaska were all factors in establishing the new trend. During the wartime commodity price inflation of 1915-1920, bond prices drastically declined. Stock prices, however, did not show the opposite tendency. They gyrated rather widely and reached peaks in 1916 and 1919, but they subsequently receded to such an extent that in 1920 their level was virtually the same as that of 1902.

*Collapse and Depression.* In the business recession and commodity price collapse of 1921, bond prices rose and stock prices declined, true to the earlier theory, but neither movement was precipitate. The paradox that bond prices plodded steadily upward through 1928 while the stock market was engaged in a period of skyrocketing prices is explained by the fact that while Federal Reserve policy succeeded in producing easy money conditions, it failed to keep bank credit out of the speculative arena. In the climactic year 1929, however, the Reserve System permitted the discount rate to be raised, and bond prices fell off slightly while stock prices were climbing to their peak. During 1930-1931 bond prices rose a little as stock prices tumbled from the heights. The black despair of 1932, however, produced a reaction in the bond market which was almost as severe, relatively speaking, as the last sickening plunge of the stock market, although it did not carry bond prices as far down as the 1921 low point. During 1933-1936 both stock and bond prices recovered rapidly, the latter achieving a new all-time high, but they both leveled off in the business setback of the following year.

*Gradual Recovery.* Beginning with 1938 the Federal Reserve System's easy money policy was again reflected in a slow but steady advance of bonds, right on through the period of wartime commodity price inflation, to still higher record prices, an advance which continued until May 1952. In 1952 the Federal Reserve System relaxed its easy money policy and bond prices declined slightly. Ownership shares, on the other hand, evinced signs of increasing, rather than decreasing, price instability. Trading restrictions imposed by the Securities and Exchange Commission produced a "thin" market in which prices dropped abruptly in 1938, even on a comparatively small volume of trading, recovered slightly in 1939, and then fell off during 1941-1942 almost to the 1921 level. From this low point they leaped upward in 1943 but then moved irregularly until the end of the war. During the early postwar years, stock prices failed to respond to the increased earnings of corporations. However, expectations of a postwar depression did not prove correct, and stock prices began to rise slowly in 1952, rapidly in 1954, and by early 1955 surpassed the high level which had been established in 1929.

**Interest Rates.** Since 1875 interest rates have passed through a complete long cycle as well as several minor fluctuations. The average yield, or effective interest rate (that is, the rate of return to an investor buying at the current price and holding to maturity), on high-grade corporate bonds in 1876 was about 6½ per cent. In 1931 the average effective rate in corporate bonds stood at its prewar level of 4½ per cent, that in long term government bonds at 3½ per cent, and that in short-term government bonds at about 2½ per cent. The yield in the more sensitive short-term obligations fluctuated the more widely, being above that on long-term bonds during 1919-1923, below during 1924-1925, above during 1927-1929, and below from then on. In 1932 all yields rose sharply, but from that point forward they descended, almost without interruption, for a decade and a half, in spite of inflationary pressure during and immediately after World War II. In 1946 the average yield on high-grade corporate bonds was about 2½ per cent. On long-term government bonds it was about 1½ per cent and on short-term government bonds about 1 per cent. During the postwar years, Federal Reserve and Treasury policy allowed interest rates to rise somewhat, and in 1955 the rate on long-term government bonds was about 2.65 per cent, that on short-term government bonds 1 per cent, and that on high grade corporate bonds 3½ per cent.

## TRADE VOLUME

**Measurement.** Comparison of trade volume in different goods, different markets, and different times poses a problem which is partly conceptual and partly factual. Trade volume is sometimes gauged by the quantity, measured in physical terms, or by value of commodities entering into exchange. Quantity is measured at the point of production and, in effect, implies only one exchange. But a pair of shoes, for example, gives rise to a great deal more trade volume if it passes, as often at present, through the hands of a jobber, a wholesaler, and a retailer on its way from manufacturer to consumer than if, as in Colonial times, the shoemaker sells directly to the consumer. Counting the shoes only once and evaluating them at manufacturing cost understates not only by ignoring subsequent transactions in which they may figure but also by ignoring distribution costs. Such a gauge makes little allowance for services paid without exchange of commodities and none at all for sales of securities, land, and the like. The concept, unfortunately, cannot be summarily discarded. It is the only one for which there exist comprehensive data on trade prior to the twentieth century. Statistics expressed in these terms probably are not seriously deceptive when the reference is to earlier times, in which distribution and financial mechanisms were much simpler. Their significance and comparability rapidly diminish, however, as the mechanisms grow more complex.

Another means of judging trade volume is by the total quantity of money payments. Such a measure is much more comprehensive than that described in the preceding paragraphs. It is therefore more useful in depicting the over-all relationships among money, credit, prices, and trade. It is defective, however, in that it cannot be analyzed in order, for example, to compare trade in different commodities. Such data, furthermore, are not available for years prior to the twentieth century.

Nothing can really take the place of data on the specific kinds of trade it may be desired to examine and compare. These aspects necessarily are somewhat fragmentary. Retail trade, for instance, constitutes only about 5 per cent of total money payments. Here, too, some of the important statistical data do not date back many years. On the other hand, this manner of approach has the advantage of representing, more closely than any of the other concepts, the ordinary person's idea of trade.

**Pioneer Trade in the United States.** Until well into the nineteenth century domestic trade in the United States was of a rudimentary sort. Farmers of the eastern seaboard usually hauled their produce to the nearest local market for sale directly to consumers, or to the nearest seaport for shipment overseas. Manufacturing establishments, engaged mainly in processing agricultural products, were small and sold most of their wares directly to local consumers. Money was scarce, and much of the trading was an exchange of goods for goods or for credit which was later discharged in goods. Pioneers who crossed the mountains in the first stages of the westward movement were forced by circumstances to

live in almost complete self-sufficiency. They could scarcely produce enough to meet their own needs, and having little surplus to sell, they had little wherewithal to buy. In any event, the cost and hazard of transport virtually precluded trade with the East. A few commodities, such as furs, were valuable enough, in proportion to their bulk, to stand the cost of carrying them out by packhorse or wagon. A little livestock could also be sent east, since it lived off the land and provided its own transportation. These were exchanged in the East for commodities, such as firearms, which the pioneer simply could not produce for himself and which could stand the high cost of westward shipment by wagon.

**Factors in Trade Development.** *Transportation.* To the limited extent that surpluses of bulkier products such as grains were available in the West, they were shipped by barge down the Ohio and Mississippi rivers to New Orleans for transshipment to the East or overseas. Since upstream navigation could be accomplished only by keelboat, arduously propelled by human power, the grain seller usually sold his barges also and made his way back north with the proceeds of his marketings in the form of money rather than provisions. Advent of the steamboat on the western rivers about 1815 not only solved the problem of upstream navigation but also reduced the cost and time of shipment downstream. As a result, commerce between the North and South in the West increased something like tenfold in twenty-five years. Construction of canals, particularly the Erie Canal which was opened in 1825, greatly reduced the cost, time, and hazard of transportation between the eastern seaboard and the region just south of the Great Lakes. There followed a rapid growth in the quantity of cereal, animal, and forest products moving North and East out of the interior to Lake Erie and thence via the Erie Canal and Hudson River to New York City. Westbound shipments consisted mainly of clothing, hardware, machinery, medicines, coffee, and sugar. Most revolutionary of all in its eventual effect on domestic trade was the introduction of the steam railroad in 1830. At first, however, the railroad companies had grave difficulty raising necessary capital, due to popular distrust based largely on ignorance and prejudice. They met with considerable opposition, furthermore, from the canal companies and other vested interests. For these and a variety of other reasons, the new mode of transport was slow in developing. Improvements in transportation brought about some widening of markets, but almost equally significant was the evolution of better marketing methods, particularly for manufactures. The census of 1840 reported 57,565 retail stores, over half of which were located in New York, Pennsylvania, Virginia, Ohio, and Mississippi. As late as the middle of the century, however, the total volume of domestic trade still was small. Secretary of the Treasury Robert Walker, in his report for 1847-1848, estimated the value of the country's annual output at $3,000,000,000, of which he judged that $500,000,000 worth was "interchanged between the states of the Union." In a report to Congress in 1853 Israel D. Andrews estimated that the total volume of internal freight traffic totaled $1,461,000,000, of which 41 per cent was carried on the canals, 37 per cent on the railroads, and 11 per cent each on the Great Lakes and rivers. This total is not comparable with Walker's trade figure because it includes some local as well as interstate commerce. It also includes duplication of goods carried successively by two or more means of transport. Nevertheless, both figures significantly indicate that at that time, in contrast with the present, only a fraction of the country's products entered into trade beyond the immediate locality. The last half of the century was characterized by a vigorous growth of domestic trade.

*Industrialization.* Reduction of transportation costs promoted geographic specialization and gave great impetus to industrialization, the second important factor in the growth of trade during this period. Before the Civil War rail shipment for any distance more than a few hundred miles had been restricted to valuable, high-grade commodities of small bulk. As it became practical to ship lower-grade commodities long distances by rail, the old inland water routes, such as the Erie Canal and the Mississippi River, were largely superseded by new rail and rail-water routes. From the eastern and central South cotton, lumber, and tobacco moved in large volume to the manufacturing region in the Northeast. To the eastward flow of rail traffic grain and flour were contributed by the Middle West, livestock and petroleum by the Southwest, minerals by the Rocky Mountain area, fruit by the south Pacific region, and lumber from the north Pacific section. Westbound traffic consisted mainly of manufactures from the Northeast. Industrialization of this region was augmented not only by the reduced cost of transporting raw materials and finished products but also by protective tariffs, which enabled American manufacturers to capture the domestic market from their European competitors. An important new trade route was that by which grain and iron ore moved out of the northern Minnesota and southern Canada region, at the head of Lake Superior, by steamer down the Great Lakes to Lake Erie ports and thence by rail to the Pittsburgh area and the eastern seaboard. Much of the return cargo consisted of coal shipped from West Virginia by rail to the Lake Erie ports and thence by steamer up the Great Lakes.

*Finance.* A third important factor contributing to the growth of trade was the development taking place in the field of private finance. The National Banking System, though imperfect in some ways, went a long way toward remedying these difficulties. Evolution of the corporate form of business organization, of investment banking, and of trading in corporate securities on organized exchanges further enhanced the flow of capital into industrial and commercial companies. On the other hand, financial activity, public as well as private, at times had adverse effects on trade.

*Improved Marketing.* A fourth factor consisted of changes in the marketing mechanism. In wholesale trading the changes involved, not invention of new institutions, but tendencies of trade to concentrate in certain large cities, which became specialized as marketing centers, and to become simpler through eliminating or by-passing superfluous middlemen. Along with the increase in the scale of manufacturing, there developed mass-production methods and product standardization which usually made it possible for the manufacturer to sell directly to the wholesaler and often to the retailer or even to the consumer himself. Establishment of produce exchanges in several of the larger commercial cities during this period helped smooth out the seasonal and other irregularities in the flow of agricultural and mineral products from producers to processors. In retail trading the peddler practically disappeared and the pre-eminence of the general store began to be superseded by the specialty store, the department store, the mail-order house, and the chain store. These new types of retail outlet represented a kind of specialization and widening of the market in that they afforded consumers, particularly in formerly inaccessible rural areas, an opportunity to choose goods which more nearly suited their needs or fancies.

*Extent of Development.* For this, as for the earlier period, there exist no comprehensive statistical data showing directly the extent of growth in the total volume of domestic trade. Such indirect evidence as does exist, however, indicates that it must have been very great, in spite of the fact that the period included thirty-one years (1865-1896) of generally declining prices and two severe depressions (1873 and 1893). The National Conservation Commission in 1915 estimated the volume of trade for the last half of the nineteenth century as follows: 1850, $2,000,000,000; 1860, $3,500,000,000; 1870, $5,000,000,000; 1880, $7,750,000,000; 1890, $12,000,000,000; 1900, $20,000,000,000. These figures might be described more accurately as the "value of goods available for trade," because they are simply the estimated aggregate value-product of agriculture, mines, fisheries, and factories, plus imports and the cost of transportation. Bogart and Kemmerer estimate that in 1860 the railroads and inland waterways carried about 50,000,000 tons of freight valued at $3,500,000,000 and that in 1914 they carried about 2,000,000,000 tons valued at about $30,000,000,000. These figures, of course, exclude strictly local trade. It does not seem unreasonable to say that between 1850 and 1900 the total volume of domestic trade increased something like tenfold.

**Twentieth Century Progress.** Domestic trade volume continued to expand during the twentieth century. There was considerable change, however, in the relative importance of the various factors contributing to the expansion. Industrialization proceeded apace. Integration of production facilities and standardization of products paved the way to larger scale mass-production at lower cost. Advancement along this line was fostered by industrial research and the invention of new processes. Development of electric power production and of the internal combustion engine introduced unprecedented flexibility to the operations of many industries, and advances in steel production reduced the costs of construction and equipment. Agricultural production was enhanced by scientific farming. In addition, the farmer devoted most of his resources to money crops, so that commercial trading became an increasingly important phase of his activities. Mineral production increased sevenfold under the stimulus of industrial demands for coal, petroleum products, and iron ore. Between 1910 and 1953 the nation's gross national product, which is the value of goods and services produced in the economy, increased as shown in this table:

GROSS NATIONAL PRODUCT, 1910-1953
(*Billions of dollars**)

| | | | |
|---|---|---|---|
| 1910 | 85 | 1939 | 165 |
| 1929 | 105 | 1945 | 275 |
| 1932 | 101 | 1953 | 300 |

*In terms of 1947 dollars, to eliminate changes in dollar value.

These figures show the real growth that has occurred in the economy since 1910 and especially since 1940. Growth in real output of goods and services has averaged about 3 per cent per year during the twentieth century. Since 1929 real output has more than doubled, and the real output per capita has increased by almost three fifths.

*Transportation.* Improvement of transportation, while important, was by no means the major factor. Development of automotive trucks and of all-weather surfaced roads was a significant advance, but the effect was principally on local trade. The railroads had virtually completed their network before 1900. Their principal subsequent contribution to trade was an increase of freight train speeds and more extensive use of refrigerator cars, thus widening the markets for perishable goods such as fresh fruits and meat. Inland water transportation experienced considerable revival of traffic, and construction of the Panama Canal greatly added to trade between the Atlantic and Pacific regions. Introduction of air transport afforded opportunity for a dramatic increase of speed in movement of very high-grade commodities. Its excessive cost, however, limited the tonnage of freight carried by this means to almost negligible proportions.

*Finance.* In the financial field several developments affected trade. Use of the corporate form became widespread among not only industrial but also trading and other commercial firms, even those of fairly small size. The flow of capital into these lines was thus augmented, and the corporations themselves added greatly to the stream of savings through reinvestment of their earnings. Irving Fisher has estimated the volume of money payments in 1900 at $275,000,000,000 and in 1909 at $400,000,000,000. Similar estimates by Wesley C. Mitchell put the volume in 1919 at $650,000,000,000 and in 1926 at $800,000,000,000. These figures, of course, include payments for labor and other services and for real estate, securities, and the like, as well as for commodities. The effects of the minor recession in 1921, of the prosperity in the later 1920's, of the severe depression in the 1930's, as well as those of World War II show up clearly in the following Federal Reserve statistics of bank deposit debits, which consist mostly, although not entirely, of check payments.

UNITED STATES BANK DEPOSIT DEBITS, 1919-1954
(*Billions of dollars*)

| | | | |
|---|---|---|---|
| 1919 | 646 | 1937 | 635 |
| 1920 | 700 | 1938 | 551 |
| 1921 | 569 | 1939 | 577 |
| 1922 | 620 | 1940 | 611 |
| 1923 | 658 | 1941 | 740 |
| 1924 | 687 | 1942 | 848 |
| 1925 | 788 | 1943 | 1,042 |
| 1926 | 838 | 1944 | 1,163 |
| 1927 | 915 | 1945 | 1,266 |
| 1928 | 1,075 | 1946 | 1,050 |
| 1929 | 1,237 | 1947 | 1,125 |
| 1930 | 892 | 1948 | 1,249 |
| 1931 | 658 | 1949 | 1,231 |
| 1932 | 456 | 1950 | 1,403 |
| 1933 | 424 | 1951 | 1,577 |
| 1934 | 479 | 1952 | 1,642 |
| 1935 | 534 | 1953 | 1,759 |
| 1936 | 614 | 1954 | 1,887 |

In comparing the magnitudes of all the foregoing statistics, it should be noted that they reflect changes in prices as well as in the physical volume of commerce.

**Marketing Changes.** *Wholesaling.* Changes in the marketing mechanism continued along the line of the trend begun in the latter part of the nineteenth century. Independent middlemen, such as the wholesaler, became less prominent as their functions were taken over by producers. The manufacturer, producing on a larger scale, tended to establish selling departments and sales branches or agencies to deal directly with the retailer or consumer. Growth in the size of retail concerns, such as department and chain stores, furthermore, made for larger individual orders, which the manufacturer found it worthwhile to solicit directly. Of the 170,000 "wholesale establishments" reported in the 1929 census, scarcely half were independent wholesalers in the traditional sense. Total wholesale trade in 1929 was reported as $67,000,000,000, 73 per cent being in nondurable goods. Three-fifths of these nondurable goods comprised food and farm products, other leading items being dry goods, petro-

leum products, and clothing, in that order. Of durable goods which constituted the remaining 27 per cent of total wholesale trade, three-fifths consisted of machinery, metals, lumber, and other building materials, although electrical goods and automotive equipment were sizeable items. The depression of the early 1930's hit wholesale trade a heavy blow, reducing the total to $30,000,000,000. Hardest hit were the durable goods, which in 1933 dropped to one-third of their 1929 volume; the lines most severely affected were building materials, electrical goods, machinery, and metals. Even nondurable goods slumped to half their 1929 volume, however, the hardest hit being clothing and farm products. Falling prices, of course, as well as diminishing physical volume, contributed to the decline of these dollar figures. By 1940 a substantial recovery had taken place, durable goods even rising above their 1929 volume due to enormous sales of automotive equipment. Among the nondurable goods, petroleum products, coal, and coke were above their 1929 volume, as were also tobacco and liquor.

Both the size and pattern of wholesale trade in 1945 reflected the impact of war production, consumption restrictions, and price increases. The total volume, $105,000,000,000, exceeded that of 1929 by more than half. About 80 per cent of the total consisted of nondurable goods, of which food and farm products, again the leading items, made up more than half. Dry goods and petroleum products continued to be important lines. Liquor and tobacco appeared as newcomers to the "best seller" list. Trade in durable goods, which made up the remaining 20 per cent of the total, was inhibited by short supply due to utilization of production facilities for munitions manufacture during most of the year. The principal lines, however, were well over their 1929 volume. Wholesale trade expanded rapidly after 1945, and by the end of 1948 total wholesale sales had reached a total of $189,000,000,000. Important items in this growth were all durable goods lines, groceries, dry goods, and petroleum.

*Retailing.* Retail sales volume in 1929 was reported as $48,000,000,000. Nondurable goods stores handled 70 per cent of this business. Food stores led, with general merchandise stores a close second, and the two together sold three-fifths of all the nondurable goods. Durable goods establishments handled the remaining 30 per cent, of which automotive equipment stores accounted for half, and dealers in building materials and hardware one-fourth. The depression of the early 1930's dealt somewhat less severely with retail than with wholesale trade, the total volume of the former declining by about one-half. As in the wholesale trade, the durable goods were hardest hit, with all the leading lines suffering about equally. In the nondurable goods lines, apparel and general merchandise stores were hardest hit. Recovery in the late 1930's brought most nondurable goods lines back to the 1929 level, and carried filling stations and eating and drinking places well above it. Neither the general merchandise stores nor any of the durable goods establishments shared fully in this recovery, although automotive equipment stores came fairly close. The 1945 retail sales volume of $78 billion was greatly influenced by war conditions. More than 85 per cent consisted of nondurable goods. As in 1929, food stores and general merchandise stores were in the lead, the two together doing about one-third of this business, while eating and drinking establishments had become a close third. Durable goods stores, handling the remaining 15 per cent of total retail trade, suffered from restriction of supply. They actually had a smaller volume than in 1940. Dealers in building materials and hardware had the largest share, about three-eighths. Automotive equipment stores were hardly above the depression level. Jewelry was the only line which showed a substantial increase in dollar volume over that of 1929, and in this the uncontrolled rise of prices was a major factor. The 1953 retail sales volume of $171 billion reflects not only an increased price level, but also a greatly expanded physical volume of trade during the prosperous postwar years. The postwar building boom and the increased sale of automobiles are reflected in the sales of durable goods stores. In the nondurable goods stores there was a sharp increase in all lines, with food and general merchandise stores still the most important.

RETAIL STORE SALES IN THE UNITED STATES, 1929 TO 1953
(*Millions of dollars*)

| *Store Classification* | *1929* | *1935* | *1939* | *1945* | *1950* | *1953* |

**Securities Trading.** Trading in securities underwent a mushroom growth during the first three decades of the twentieth century. The New York stock exchange had been organized informally in 1792 and formally in 1817, primarily to facilitate trading in Federal government securities. Exchanges were subsequently organized in several of the large commercial cities, but the bulk of the trading was always done in the New York stock exchange. As time went on, the stocks of the United States Banks and of state-sponsored internal improvements, railroad securities, and finally other industrial securities were listed for trading. Throughout the nineteenth century most of the trading was in government and railroad bonds. The volume of sales of all types of securities, for that matter, was diminutive compared with that in more recent times. After the depression of the 1890's was over, however, a wave of corporate consolidations generated a veritable flood of industrial bonds and stocks. Activity in these securities during the next fifteen years completely overshadowed the trading in Federal government bonds and, except for a brief flurry in 1905, in state and municipal issues. The securities market was very sensitive to changes in economic conditions and came to be widely reguarded as a business barometer.

*Stock Market Boom.* The boom years of the middle 1920's were characterized by rapid growth of stock trading. The number of shares sold on the exchange climbed from 236,000,000 in 1923 to 454,000,000 in 1925 and 920,000,000 in 1928, with prices continuously rising. These figures, expressed in terms of shares, exaggerate to some extent the

increase in volume of sales because many corporations "split" their stock, some of them several times over, in order to keep the trading units down to a size convenient for the thousands of small amateur traders then in the market. Industrial bond volume was substantial, but did not grow after 1924. Trading in government bonds persistently declined, but that in foreign bonds just as persistently increased. Among industrial securities the most active were those of public-utility holding companies, which were rapidly expanding and extending their control to embrace operating utilities throughout the country. The record stock volume of 1,125,000,000 shares in 1929 came mostly after the price break in the autumn, 16,400,000 shares being traded on the single memorable day of October 29, after which the exchange was forced to close temporarily.

*Obstacles to Recovery.* The securities market did not materially participate in the revival of the mid-1930's for several reasons. Perhaps most important was the newly imposed Securities Exchange Act restriction on short selling, margin trading, and other practices. Furthermore, new corporate securities were not forthcoming, partly, it was alleged, because of complex and expensive registration and other requirements in the Securities Act, although at least equally important were doubts on the part of potential issuers that new capital could be profitably employed. Finally, the great majority of speculative traders who had participated in the boom of the 1920's simply had neither the courage nor the money to re-enter the market. Deficit financing and long-term borrowing by the Federal government brought on substantial trading in its bonds, particularly in 1934, but foreign bonds were anathema. A flurry of activity occurred in industrial bonds and stocks during the abortive prosperity of 1936 and the minor recession which followed in 1937.

The war's conclusion brought some resurgence of activity in industrial securities. A number of factors, however, acted to prevent the development of a boom. During the war the capital needs of many munitions-producing enterprises had been met, in part at least, by direct government loans. Their capital requirements for postwar reconversion could not be met from this source, but the prevailing low interest rates made it propitious for them to continue borrowing. Much of their borrowing consisted of direct loans from large institutional investors, such as insurance companies, so that the supply of bonds in the open market was not greatly augmented. Stock trading increased somewhat; but commodity price controls, materials shortages, and wartime tax rates and the emergence of numerous labor disputes tended to counteract any bright prospects for corporate earnings. This picture began to change in 1952. Corporate earnings and dividends were at their highest levels, and attitudes of investors changed to one of enthusiam. By 1955 stock prices were at an all-time high. The volume of stock sales on the New York stock exchange for the first four months of 1955 was 255,000,000 shares.

**Role of Foreign Trade.** It is sometimes said that no leading commercial nation is less dependent on foreign trade than the United States. By this is meant, apparently, that the volume of its foreign commerce, while larger than that of any other country, is insignificant compared with that of its domestic trade. Throughout its history, to be sure, the total quantity of its exports and imports has never been more than 10 per cent of its production of goods entering into trade. Compared with domestic trade in the sense of money payments, indeed, the value of its foreign trade is almost infinitesimal. Such comparisons, however, obscure the fact that foreign commerce in certain commodities, with certain areas, and at certain times may have an importance entirely out of proportion to its size. Some commodities which are producible, if at all, only at an excessive cost disadvantage, are essential industrial raw materials, even though in small amounts. Other commodities are produced and distributed domestically under such conditions that sales abroad, though small, may at times be the margin of difference between success and failure for the producer.

**Development of Foreign Trade.** One of the first steps taken by the Federal government in 1792 was passage of legislation to promote overseas commerce by allowing lowered duties on imports carried in American vessels. During the last decade of the eighteenth century about half of the exports, which consisted almost entirely of crude foodstuffs and other raw materials, went to the British Isles and Dominions. Nearly three fourths of the imports, consisting of manufactures and other supplies not produced in this country, came from those sources. Great Britain had closed the West Indies to American traders, but when she became involved in war with France in 1793 the distraction prevented her from keeping the embargo effective. Although the United States remained neutral during the Napoleonic Wars, our ships supplied nations on both sides of the conflict. A considerable portion of the supplies originated in the West Indies and were re-exported from United States ports. During the years 1805-1808 these re-exports actually exceeded in value the exports of domestically produced commodities. Domestic exports also increased, however, because war and crop failures in the European nations made them heavily dependent on American agriculture. France and Great Britain each resented the material support which the United States gave the other. Each issued orders forbidding this country to trade with the other. France lacked the ships to enforce her orders, but the British effectively harassed our commerce, even with other neutrals. The resulting War of 1812 reduced United States foreign trade to a mere trickle. Since a high proportion of the country's population was engaged in agriculture and another large segment directly

or indirectly in shipping and shipbuilding, the serious effects of this blow were widespread. The war, however, had the additional effect, which in the long run proved favorable, of asserting American commercial independence and of stimulating domestic manufacture.

*Rise of the Tariff Issue.* Immediately after the close of the war foreign trade rose to a new record level. But within a few years the British Corn Laws restricted United States exports of grain, her own tariffs on textile products and some metals reduced her imports of these important commodities, and in the depression which followed the crisis of 1819 foreign trade again dwindled. The tariff laws of 1824 and 1828, particularly the latter, which earned the popular epithet "Tariff of Abominations," extended the protective principle so far that it created between the leading political parties a major issue which continued for more than a century. Under the law of 1832 the average rate on dutiable commodities was 33 per cent ad valorem. In 1833 provision was made for gradual reduction to a uniform rate of 20 per cent by 1842, but in the latter year high duties were reenacted. In 1846 the British Corn Laws were repealed and the United States tariff law effected some moderation of rates. The law of 1857 brought further reductions, the rate on most dutiable commodities being made 24 per cent ad valorem. In spite of protective tariff legislation and of setbacks in the depressions of 1837, 1842, and 1857, foreign trade grew nearly fivefold between 1820 and 1860. The natural resources of the United States and its specialization in agriculture gave it an advantage over nearly all the rest of the world in production of such staples as cotton and grains. Europe, on the other hand, was reaping the fruits of the Industrial Revolution and was able to supply this country with urgently needed manufactures, many of them produced from raw materials of American origin. Foreign commerce, furthermore, was stimulated by improvements in the art of shipbuilding, such as the development of the clipper ship by American shipbuilders and of the iron steamship by the British. With few exceptions the balance of trade continued to be adverse to the United States. That is, its commodity imports exceeded its commodity exports in value, the difference being settled by foreign investment of capital in such American internal improvements as canals and railroads, by American shipping service rendered to foreigners, and after 1850 by exports of gold from the newly discovered deposits in the West.

*Position in 1860.* In 1860 three fourths of the United States' exports went to Europe and more than half of the rest to its neighbors on the North American continent, including the West Indies. Seven tenths of the exports consisted of crude foodstuffs and materials for manufacture, the largest single item being cotton destined for British mills. Other leading items were grains, flour, meat, and tobacco. America's best customers, apart from Great Britain, were France, Germany, Holland, and Spain. Of American imports three fifths came from Europe, the largest items being woolen and cotton textiles from British mills. Half of the remainder consisted of foodstuffs, such as West Indian sugar, from North American countries. No large volume of trade had yet developed with South America, the Orient, or Africa, although Brazilian coffee was becoming an item of some importance, and the China trade, while small, provided an outlet for certain American manufactures unmarketable in Europe and a source of exotic items not available either in Europe or the Western Hemisphere.

During the Civil War import duties were greatly increased, partly to raise revenue and partly to compensate for the impact of greatly increased domestic excise taxes. Although some trade with European and other nations moved in and out of northern ports during the war, the blockade of southern ports practically cut off exports of the leading 1860 item, cotton, and greatly diminished those of tobacco. The South had thought England so dependent on cotton that if her supply were cut off she would be forced to intervene on behalf of her supplier. The British mills, however, were able to continue operating on the stocks they had accumulated during the bumper crop years of the late fifties, and their government gave no substantial aid to the secessionists.

*The High-Tariff Era.* After the close of the war most of the domestic excises were removed, but northern manufacturers were able to prevent reduction of the high import duties, from whose protection they had profited. The agricultural South, of course, was injured by protective tariffs, but it was unable effectively to counteract the Northern pressure on Congress. Development of the West, as a result of the Homestead Act and of transcontinental railroad construction, opened up new grain- and cattle-producing regions, new mines and petroleum deposits, all of which contributed to the growth of exports. They were principally useful to industrial Europe. Import trade grew much more slowly, being inhibited by protective tariffs, and in the middle 1870's its value was overtaken by that of exports. From this time forward the trade balance, with few exceptions, remained favorable. For some years the excess of commodity exports over commodity imports continued to be so small that it was entirely absorbed by "invisible items" such as interest on earlier foreign capital investments in American internal improvements, expenditures of American travelers abroad, and payments to foreigners for shipping and marine insurance service. Freight payments to foreign shipowners were appreciable because a large proportion of American vessels had been destroyed, sold to foreigners, or converted to military use during the Civil War, and the deficiency was

not afterward made up by new construction. American shipbuilders found that they could not effectively compete with British builders, and so turned their energies and capital to other industries. Throughout the 1880's the high-tariff opponents, particularly in the West and South, sought tirelessly to secure reductions. Apart from extension of the free list to include several commodities which did not compete with American production in any event, their efforts were largely fruitless. By this time the high-tariff advocates had been forced to abandon the attitude of "protection of infant industries" as a basis for their position, because the protected industries were no longer infant. Instead, they argued that tariffs "protect the American worker from pauperization by competition with cheap foreign labor." This shifting of ground gave protectionism an appeal to the masses rather than merely to industrialists and provided apparent justification for high tariffs as a permanent commercial policy and not just as a temporary expedient.

The McKinley Act of 1890, titled "an act to reduce the revenue and equalize duties on imports," did not merely provide for retention of the protection established by the high Civil War duties; it greatly extended the protective system and raised the average level of duties to nearly 50 per cent. It placed sugar, coffee, tea, and hides, none of which offered serious competition to American producers, on the free list, but authorized the President to impose import duties on them if he considered that the countries of origin were levying "unjust or unreasonable" duties on United States exports. Under this threat, reciprocal trade agreements were made with Brazil, with several Central American countries, and with Great Britain and Spain for their West Indian colonies. This tariff act, as well as the silver legislation enacted in the same year, undoubtedly contributed to the price rise which culminated in the crisis of 1893 and to the decline of foreign as well as domestic trade in the following depression. The Congress which had been elected in 1892 was less protectionist than its predecessor, and in 1894 it passed the Wilson Act, providing some slight moderation of import duties. The following Congress, however, was strongly protectionist, and the Dingley Act of 1897 raised the rates to a record 57 per cent level.

*Development of New Markets.* As indicated by the accompanying table, European nations in 1900 continued to be the United States' best customers, still taking about three fourths of United States exports, and North American countries still took slightly more than half of the rest. However, South America, Asia, and Oceania were beginning to be significant export areas, each of them taking more than all of them together had taken in 1860. By the turn of the century an important shift was taking place in the commodity character of United States exports. Manufactures, which in 1860 constituted less than one third of the total, now amounted to three fifths in 1900. Raw cotton for British mills again was the principal single item, with animal products and grains and their preparations following in that order. But petroleum and its products, machinery, and metals and their products, none of which had been important items in 1860, had begun to assume some significance. The imports picture was even more sharply changed. That Europe supplied only slightly more than half the total in 1900 reflected the decline of the United States' dependence on European manufactures. Although its North American neighbors provided only one third of the rest, sugar was by far the largest single item. South America made appreciable contributions of Brazilian coffee and Argentine hides for the rapidly growing boot and shoe industry. The most significant increase was in imports from Asia. These consisted mostly of raw silk from Japan and crude rubber and tin from the Malay States and East Indies. The profound change in the commodity character of imports may be summarized by the statement that materials for the supply of American industries, which in 1860 had constituted only one third of the total, amounted to three fifths in 1900.

*American Ascendancy in World Trade.* Paralleling in importance these shifts in the character of exports and imports was the contrast in their relative values. In 1860 the foreign trade was in approximate balance. In 1900 the total value of commodity exports exceeded that of commodity imports by 64 per cent. This large favorable balance of trade heralded an important change in the country's position in international affairs. In the twentieth century the foreign trade of the United States expanded more than six times as much as in all its previous history and made it the leading commercial nation of the world. This growth resulted from many factors, of which the role played by the United States in World Wars I and II was predominant. Only slightly less important, and closely related thereto, was the increasing tempo of the nation's industrial development. The first decade was characterized not only by an expansion of exports, but also by an increase in the shift, previously mentioned, from crude agricultural and mineral products to finished and semifinished manufactures. Possessing an abundance of the basic natural resources requisite to industrialization, an adequate inland transportation system, plentiful labor of high quality, and ingenuity which developed mechanical mass-production techniques, the nation began to compete with European manufactures on their own ground. High tariffs inhibited importation of the latter, but industry brought in ever-increasing quantities of needed materials like rubber, silk, tin, nickel, and hides, which were domestically unavailable or available in inadequate amounts. The rising and widely distributed national income, furthermore, provided purchasing power to make effective an increasing popular demand for tropical foodstuffs.

The Payne-Aldrich Tariff Act of 1909 raised almost as many duties as it lowered. It kept the protection system virtually unchanged. An antiprotectionist Congress in 1913, however, passed the Underwood Act which, while not a free-trade measure, brought the most thorough revision of tariff policy since the Civil War and reduced the average level of rates to about 30 per cent.

*World War I.* Before the lower rates had been in effect long enough for their consequences to become apparent, war broke out in Europe, drastically altering the character of American commerce. Imports from the belligerents were greatly reduced as they devoted their resources and manpower to military uses. On the other hand, exports to them, not only of munitions but also of food and other consumption goods, greatly increased. The trade balance became more favorable, and American indebtedness abroad was almost entirely wiped out. After the United States entered the war its foreign trade was restricted by the needs of its own expeditionary forces and by the increased sinking of its ships. A program was instituted for construction of a merchant marine under government sponsorship and financing, however, so that the foreign trade was by no means completely cut off. After the war, shipments for the relief and rehabilitation of war-torn nations took the place of munitions. A considerable portion of the exports, which reached their peak in 1920, was financed by long-term loans, so that the United States, which had been a debtor nation up to World War I, became a creditor of great magnitude.

**World Trade Decline.** The crisis of 1920 brought an end to expansion. In spite of rapid recovery and prosperity in domestic trade, foreign trade declined throughout the twenties. Booming prices attracted to the domestic market nearly all the attention of American manufacturers and merchants, many of whom had been interested in foreign markets only as dumping grounds for their surpluses. Imports were inhibited by the high duties of the Fordney-McCumber Act of 1922, which extended the protective system even to agricultural products and raised the general level of rates to about 36 per cent. America's World War I merchant marine had fallen into decay and, as after the Civil War, its obsolete ships were not replaced because American shipbuilders and operators found they could not economically compete with the British. The world-wide depression which began in 1929 brought a further decline in foreign trade. Reduction of purchasing power abroad severely hit our exports, not only of manufactures but also of foodstuffs and even of cotton. Organized pressure from agriculture, later joined by manufacturing interests, led Congress in 1930 to pass the Hawley-Smoot Act, which raised the rates to an average of nearly 53 per cent and further restricted imports. This act, coming as it did when trade was already in the doldrums, aroused resentment both abroad and at home. Other countries raised their tariff and quota barriers against American exports. Even Great Britain, which for generations had been ardent in its advocacy of free trade, enacted protective tariff legislation. Domestically the Hawley-Smoot Act became an important issue in the 1932 election campaign. The new Congress did not revise the tariff, but in 1934 it passed a Trade Agreements Act which authorized the President at his discretion to enter into agreements for reduction of duties on particular commodities coming from particular countries in exchange for trade concessions from those countries. Under this authority during the following decade reciprocal trade agreements were signed with twenty-seven countries, including the United Kingdom and the British colonies, Canada, France and its colonies, the Union of Socialist Soviet Republics, the Kingdom of the Netherlands, Cuba, Brazil, and most of the other Latin-American countries.

**Effects of World War II.** Foreign trade revived somewhat during the later 1930's, partly due to war preparations abroad. Its growth, however, was restrained by the Johnson Act of 1934, forbidding loans to governments in default on debts to the United States (which included most of the country's allies in World War I and its best customers), by the 1936 embargo on loans to all belligerents, and by the Neutrality Acts of 1937 and 1939, forbidding American vessels to trade with belligerents.

*Trade Position in 1940.* Total exports in 1940 were nearly three times those in 1900. Only 41 per cent of the 1940 exports went to Europe, however, scarcely more than half the 1900 proportion. North American countries received 27 per cent, nearly twice the proportion in the earlier year. Asiatic countries received 15 per cent and South American countries 11 per cent. The commodity distribution of exports clearly depicted the nation's complete industrialization, seven eighths of the total consisting of manufactures. Raw cotton was no longer the principal item. Machinery, iron and steel and their products, petroleum and its products, automobiles and parts, in that order, had risen to the leadership. The exports picture, of course, was colored in no small degree by the outbreak of World War II in Europe. A considerable proportion of all the leading items mentioned above consisted of equipment and supplies destined for direct or indirect military use by Great Britain, France and Canada.

The change which took place since 1900 in the imports situation was hardly less drastic. European nations, which in the former year had supplied 52 per cent, now supplied only 15 per cent of the total. The Asiatic area provided 37 per cent as contrasted with 17 per cent, and North American countries 26 per cent as contrasted with 15 per cent at the turn of the century. Even South America's share was increased from 11 to 15 per cent. All these increases in proportions represented even greater absolute increases, for the value of 1940 total imports was more than three times that of 1900. Nearly 73 per cent of the 1940 imports consisted of supplies, crude and semimanufactured, for American industry as compared with 60 per cent in 1900. The largest single item was Malayan and East Indian rubber for use by the automotive industry. Nonferrous metals and ores, especially tin from Malaya and nickel from Canada, were second, with wood pulp and paper, principally from Canada, a close third. These were followed by Brazilian coffee, Japanese silk, and Cuban sugar in that order. A new entry to the list of principal items was petroleum and its products, which also appeared on the list of leading exports. The imports consisted mainly of crude petroleum shipped in by

American refiners from Venezuela and exported as refined petroleum products to various areas.

COMPOSITION OF UNITED STATES IMPORTS, 1860 TO 1953

The excess of exports to Great Britain over imports from that country was responsible in large part for the 1940 favorable balance of trade. Since her industry had been converted to war production, she was unable to maintain her normal peacetime exports. Under the Johnson Act she was not eligible to receive long-term credits in this country. In desperation, she liquidated practically all of her remaining American investments in order to pay cash for her purchases, and carefully restricted such purchases to minimum amounts of absolute essentials for prosecution of the war.

*Lend-Lease Shipments.* At this juncture Congress passed the Lend-Lease Act authorizing shipment on government account to nations opposing the Axis powers, not only munitions but also industrial materials and equipment, food,

or any other supplies which the President deemed essential for effective prosecution of the war, without definite arrangement as to repayment of the resulting credits. Throughout the rest of the war years most of the country's exports were under Lend-Lease.

Of the total, the United Kingdom received 43 per cent, the Union of Soviet Socialist Republics, 29 per cent; countries in the Middle East and Mediterranean areas, 11 per cent; China and India, 7 per cent; and Australia and New Zealand, 4 per cent. The United States received reverse Lend-Lease aid in the amount of $5,600,364,000, consisting mainly of capital installations abroad, munitions, petroleum products, and shipping services in approximately equal amounts. Of the total, the United Kingdom supplied 68 per cent, Australia and New Zealand 17 per cent, and India 9 per cent. Except for small token settlements and recoveries of unused supplies, the excess of Lend-Lease aid given over that received was regarded as part of the war cost and not as a favorable trade balance to be liquidated by subsequent imports or by capital investments abroad. Throughout the war the United States carried on considerable trade, both export and import, with Canada in munitions and war supplies, and with the Latin-American republics in nonwar commodities, on a normal exchange basis. This trade was closely controlled by a licensing and quota system. Submarine sinkings of both British and American ships forced this country into a shipbuilding program which dwarfed that of World War I. Disposition of this merchant fleet, by far the largest of any nation, remained unsettled after the war. The foreign trade pattern in 1945, of course, was strongly influenced by exports of war supplies during the first half and of relief supplies during the last half. Of the total exports, 56 per cent went to Europe, 20 per cent to North American countries, 14 per cent to the Pacific war theater, and 7 per cent to South America. Nearly seven eighths consisted of finished and semifinished manufactures, of which machinery, petroleum products, iron and steel products, and automotive equipment were the leading items in that order. Of the total imports, 46 per cent came from North American countries, 23 per cent from South America, 17 per cent from the Pacific area, and 10 per cent from Europe. Less than one third consisted of finished manufactures, the leading items being coffee, wood pulp and paper, wool, nonferrous ores and metals, and sugar, in that order. The volume of foreign trade expanded sharply with the postwar prosperity, as is shown by the export and import statistics for 1953. In that year imports were more than double the 1945 level, and exports had increased over 60 per cent; however, the commodity classes had shown little change.

## OTHER TRADE FACTORS AND TRENDS

**Production, Employment, and Payrolls.** In some ways the situation and trend of general business conditions at any particular time may be revealed less completely by prices and trade volume than by certain other factors. Among these other measures, three of which are highly regarded by business analysts, are production, employment, and payrolls. Production is both fundamental, since it measures the quantity of physical goods made available for trading, and sensitive, since it tends to fluctuate more widely than does total business activity. The significance of employment, of course, is in its indication of the working population's occupation in income-producing activity. Payrolls help fill out the employment-income picture by including the effects of wage-rate changes and of part-time employment.

In the 1921 recession production and employment were curtailed only a little more than 20 per cent. Payrolls were reduced about 35 per cent, however, because many factories effected a portion of the production adjustment by putting retained workers on part-time. During the generally prosperous eight years which followed, the output of physical goods doubled. Employment increased by only a little more than one-fourth, reflecting not only a return to full-time employment but also a rise in workers' productivity; the latter was consequent upon greater mechanization of production

processes and thus improved efficiency in utilization of labor, for which the workers were compensated by a more than proportionate increase in payrolls. An important aspect of production during this period was that the largest increases were in durable goods such as automobiles, home furnishings, and industrial equipment. When depression struck in 1929-1932, the demand for these goods collapsed, since they did not require immediate replacement. Their production was rapidly curtailed, and the depression soon spread to nondurable goods. The number of workers in all factory employment declined about 40 per cent. Output of physical goods dropped back nearly 50 per cent to the 1921 level as workers again went on part-time. For this reason and because of wage-rate reductions, factory payrolls fell off almost 60 per cent to a level far below that of 1921.

In the 1933-1937 recovery period productivity was restored as employment and production returned to the 1929 figures. Payrolls rose a little more sharply, but did not go as high as in 1929. All three indexes descended together in the minor setback of 1937-1938, and they rebounded together under the impetus of the 1939-1940 national defense program. During the 1941-1943 period of all-out war production, industrial effort and output rose to unprecedented heights, although the change in character of product casts some doubt on the comparability of the index figures with those of earlier peacetime years.

Immediately after the European invasion in mid-1944 the military branches of the government began cutting back their orders for munitions and stepping up the rate at which they drafted men into the armed services. As a result, factory production and employment fell off slightly. In order to expedite the flow of workers from plants whose munitions orders had been reduced to plants with continuing programs, however, the latter were permitted to raise their wage rates, and payrolls as a whole increased a little. Even before V-E Day and V-J Day, military production programs were being cut back drastically, but reconversion to peacetime production was slow. During 1945 and 1946 factory output fell off nearly one third, and employment and payrolls about one fifth, from the 1943 peak. After the 1946 reconversion period, production, employment, and payrolls began to rise rapidly, and soon surpassed the wartime levels. In comparison to the 1947-1949 averages, up to then the highest in the country's history, production in 1954 was 25 per cent higher, employment 10 per cent higher, and payrolls were 38 per cent higher. *See also* BANK FUNCTIONS AND OPERATIONS; BANKING, HISTORY OF; BANKING, INVESTMENT; BANK LAWS AND SUPERVISION; CREDIT INSTRUMENTS; FOREIGN EXCHANGE AND CREDIT; INDUSTRIAL AND MARKET CENTERS; MARKETING AND MERCHANDISING; MONEY. R. W. Ma. and J. W. L.

**TRADE-MARK.** The Federal Trade-Mark Act of July 5, 1946, which became effective on July 5, 1947, defined trade-marks as including: "any word, name, symbol, or device or any combination thereof, adopted and used by a manufacturer or merchant to identify his goods and distinguish them from those manufactured or sold by others" (Section 45).

**Historical Aspects.** The statutory definition is a restatement of common-law concepts of the meaning and function of trade-marks, which have been used since antiquity to identify the origin of merchandise, the processors and sellers of commodities, and the makers of articles of commerce. Indeed, the use of identifying trade-marks was at times made compulsory by law in various jurisdictions and localities centuries ago, and trade-mark regulation was associated with the earliest attempts at economic regulation in the interest of consumer protection and maintenance of standards of quality by the English guilds. Not only has the importance of the trade-mark kept pace with the growth of manufacture, trade, and commerce, but the trade-mark has been a vital factor in the facilitation of business growth. The law's concern with the protection of trade-mark rights was well phrased by the United States Supreme Court opinion in Mishawaka Mfg. Co. v. Kresge Co., 316 U. S. 203,205 (1941): "The protection of trade-marks is the law's recognition of the psychological function of symbols. If it is true that we live by symbols, it is no less true that we purchase goods by them. A trade-mark is a merchandising short-cut which induces a purchaser to select what he wants, or what he has been led to believe he wants."

**Modern Federal Law.** Nevertheless, only belatedly has Federal law assumed its share of responsibility for trade-mark protection and supplied much-needed systematization for the regulation of a business adjunct which has outgrown localism. Trade-mark legislation was first enacted by Congress in 1870. This original statute provided for registration of trade-marks in the Patent Office and made the wrongful use of the registered trade-mark by unauthorized persons a cause of action for damages in a civil suit by the owner of the registered mark. The fraudulent use of registered trade-marks was first made a criminal offense by Congress in 1876. Prosecutions brought under these criminal provisions culminated in the Trade-Mark Cases decision by the United States Supreme Court in 1879, which invalidated the trade-mark law on the ground that the legislation was not confined to trade-marks used in commerce, which was subject to regulation by the Federal Government, and hence exceeded congressional powers under the Constitution.

In 1881 Congress enacted trade-mark legislation which eliminated the invalidating defects noted by the Supreme Court in the earlier statutes, but which was woefully inadequate, in that application of the law was restricted to trade-marks used in foreign commerce and with Indian tribes and excluded interestate commerce from Federal protection. Not until 1905 did new basic legislation accord to trade-marks used in interstate commerce the comprehensive protection needed by the development of regional and national commerce, with its concomitant enhancement of the importance of the trade-mark as a species of business good will. The Act of 1905, and the laws amendatory thereof, were supplemented by the Federal Act of 1920. These laws, as well as incidental trade-mark provisions in other laws dealing primarily with unrelated subjects, were co-ordinated and codified into a single enactment by the Federal Act of 1946.

With reference to Federal statutes prior to that of the Act of 1946, it was generally held that Federal registration of trade-marks conferred no substantive rights upon the registrant. The courts declared that registration could not confer a title to a trade-mark, if some other person had acquired a prior right by adoption and use. Federal registration did, however, accord the registrant important advantages relating to procedure, proof, and redress in infringement suits. Registration under the Act of 1905 is held to create a presumption of validity, to constitute prima-facie evidence of ownership of the trade-mark by the registrant. Another important advantage is that the registrant can seek redress in the federal courts against infringement of trade-mark in interstate or foreign commerce without regard to the restrictions concerning diversity of citizenship and minimum amount in controversy, which otherwise prevail when Federal jurisdiction is invoked.

The Act of 1946 has extended the advantages and protection of Federal registration, and indeed appears to constitute a new departure in trade-mark law in that it purports to base substantive rights upon registration as distinguished from evidentiary advantages and mere implementation of common-law rights. Thus, Section 15 of the Act of 1946 declares that upon the expiration of five years following registration under the act, "principal register" trademarks shall be incontestible (except in certain instances specified in the law) and thereupon the certificate of registration shall be conclusive evidence (subject to statuatory exception) of the registrant's exclusive right to make appropriate use of the registered mark in interstate and foreign commerce (section 33[b]).

Any trade-mark used in interstate or foreign commerce by which the goods of the applicant may be distinguished from the goods of others is registrable on the "principal register" of trade-marks in the Patent Office, under the Act of 1946, except such as fall within a category of marks expressly made ineligible by the statute. Among the marks thus disqualified are those consisting of, or comprising, immoral, deceptive, or scandalous matter, flags or insignia of governmental entities, names or portraits of living persons used without due authorization, or the name or portrait of a deceased president of the United States during the lifetime of his widow except by her consent.

In addition, registration will be denied to a mark which so resembles a mark registered in the Patent Office, or a mark or trade-mark previously used by others, as to be likely, when applied to the goods of the applicant, to cause confusion or mistake or to deceive purchasers. However, the law provides for issuance of concurrent registrations to applicants, each limited to a designated area or mode of use, in cases when concurrent, lawful use of marks makes such type of registration an equitable solution of the relative rights of the parties. Marks which are merely descriptive of goods, or geographically descriptive of them, are not registrable unless the mark has become distinctive of the applicant's goods. The act authorizes the Patent Office to accept as prima-facie evidence that the mark has become distinctive five years exclusive and continuous use of such mark by the applicant, in interstate or foreign commerce. A mark which is primarily merely a surname is not registrable.

The Act of 1946 provides for the registration of "service marks," which are defined in the law as "used in the sale or advertising of services to identify the services of one person and distinguish them from the services of others, and includes without limitation, the marks, names, symbols, titles, designations, slogans, character names, and distinctive features of radio or other advertising used in commerce" (Section 45).

An application for registration must comply with the rules and regulations of the Patent Office and include a written application, a drawing of the mark, five specimens of facsimiles, and a filing fee of $25. The written application must be signed and sworn to by the applicant or an officer of a corporate applicant. It must contain a request for registration and, among other data, include the name, address, and citizenship of the applicant, and a declaration that the applicant is using the mark upon particularly described goods, in interstate or foreign commerce, and that to the best of the applicant's knowledge no one else has the right to use the mark in such commerce. The date of applicant's first use of the mark in connection with the goods specified in the application must be given, as well as the date of first use in interstate or foreign commerce. The Patent Office has established in its rules fifty-five classifications of goods and services, and the applicant should designate the class of his merchandise according to the official classification, as well as the manner in which the mark is used on, or in connection with, the particular goods described. The many detailed requirements of trade-mark registration render it essential that the applicant obtain a copy of the rules, if he is to prosecute his own application. However, the applicant may be represented by an attorney-at-law, or other person authorized to practice in trade-mark cases.

A certificate of registration remains in effect for twenty years, provided the applicant within one year next preceding the expiration of six years from the date of registration files an affidavit that he is still using the mark or showing special circumstances excusing nonusage. If the affidavit is not filed, the certificate of registration is cancelled at the end of the sixth year. Each registration may be renewed for a period of twenty years. A registered mark is assignable with the sale of the good will of a business and should be recorded.

All applications are treated as seeking registration on the principal register. The Patent Office under the Act of 1946, however, maintains a supplemental register, which is a continuation of the register under the Act of 1920. In this register are recorded trade-marks communicated to the Patent Office by the international bureaus provided for by the convention for the protection of trade-marks and commercial names made and signed in Buenos Aires on Aug. 20, 1910. In the supplemental register there may also be recorded descriptive trade-marks and certain other marks not eligible for registration in the principal register, if used for one year, or if domestic registration be required as a prerequisite to foreign registration. A mark registered on the supplemental register may be transferred to the principal register upon qualifying. Registration in the supplemental register is not prima-facie evidence of ownership, does not constitute constructive notice of the registrant's claims, and does not become incontestible.

The Act of 1946 contains a description of infringement of trademark in generic terms, including use in interstate or foreign commerce of a colorable imitation of any registered mark in connection with the sale of goods or services, likely to cause confusion, or mistake, or to deceive purchasers as to the source of origin of such goods or services. Redress for infringement of Federal Trade-Mark Registration includes provision for treble damages, as well as recovery of the profits of the infringer, and comprehensive injunctive relief.

The registrant of a mark is required to give notice of registration by displaying "Registered in the U. S. Patent Office," "Reg. U. S. Pat. Off.," or "R" enclosed with a circle. In the absence of such notice, recovery of damages or profits against an infringer may be had only upon a showing that he had actual knowledge of registration.

It must, moreover, be noted that the law of trade-mark infringement is merely a branch of the law of unfair competition. Courts of equity may enjoin as unfair competition the use of words associated with the business of others, even though such expressions are not eligible for registration as trade-marks and indeed not capable of becoming common-law trade-marks.

**TRAFALGAR, BATTLE OF** [trəfæ'lgər], the greatest naval engagement of the Napoleonic Wars, off Cape Trafalgar, on the southwest coast of Spain, Oct. 21, 1805. Fought between a British fleet under Lord Nelson and a combined French and Spanish fleet under the French Admiral Villeneuve, the Battle of Trafalgar did not, as is sometimes asserted, save England from a French invasion. Napoleon had some weeks earlier withdrawn the army assembled along the English Channel and ordered it to march against Austria. Yet the completeness of the English victory ended once and for all any menace from French naval power. Nelson had 27 ships at his disposal, with which to oppose a slightly smaller allied fleet. His strategy called for a split of the enemy force in two and the subsequent piecemeal destruction of each half. This plan was carried out with such effectiveness that no less than sixty per cent of the allied fleet was captured. This success is all the more remarkable as the battle was fought near the protecting Spanish coast, which the allies sought to reach in vain; Nelson, whose brilliant strategy prevented their seemingly easy escape, was killed in the battle. M. K.

**TRAFFIC ACCIDENTS.** *See* SAFETY.

**TRAGEDY,** a term applied to a serious literary composition, usually a drama which ends unhappily. The original Greek word τραγῳδία (*tragedia*) comes from τραγῳδός, literally "goat-singer" (τράγος, he-goat; ᾠδός, singer), and this odd name for what was originally a choric ritual song and dance has provoked conflicting explanations: that the performance was attended by the sacrifice of a goat; that the prize for the best performance was a goat; or that the performers were originally dressed in skins as goatlike men or satyrs or creatures akin to satyrs.

At all events, from the fifth century B.C. onward τραγῳδία meant a serious drama, generally based on a heroic legend. It might end happily or unhappily, but it always involved scenes of pity or terror and had by this time acquired a dignity that contrasted with the burlesque of comedy or the satyr drama. This was also true of the Latin *tragoédia,* but the dark ages forgot that "tragedy" was necessarily drama at all. Thus in the fifth century of the Christian Era Dracontius of Carthage gave the name of tragedy to his *Orestes,* a narrative poem in hexameters; Isidore, two centuries later, calls Horace, Juvenal, and Persius "tragedians," and in Byzantine Greek the word, like the modern Greek τραγούδι, means simply "song." In medieval Western Europe the term came to be applied to any narrative with an unhappy ending: in Chaucer's words, "a ditee of a prosperitee for a tyme, that endeth in wrecchednesse." Accordingly Chaucer gives this name both to his own verse narrative, *Troilus and Criseyde,* and to the doleful anecdotes with which his Monk annoys the Pilgrims in *The Canterbury Tales.* Similarly Dante called the *Divina Commedia* a "comedy" simply because it ended in Paradise, and he remarks elsewhere that an unhappy tale was called a "tragedy" or "goat-song" because a goat is a noisome beast. His fourteenth-century commentator, Francesco da Buti, explained the term with still more ingenuity: any passage from good to evil fortune, he says, is like a he-goat, because the creature is superb with horns and beard in front, but naked and squalid behind. With the Renaissance men realized anew that tragedy was essentially drama, but the medieval stress on an unhappy ending has somehow persisted ever since.

Thus for Antiquity a tragedy was a serious play, not always with an unhappy ending; for the Middle Ages it became any narrative, provided that the end was unhappy; for the modern world it is again a play, but the unhappy ending has now become essential. In other words the strict modern counterpart of the ancient τραγῳδία is not so much "tragedy" as "serious drama." This point is of some importance. To ignore it distorts, for example, the sense of Aristotle's *Poetics* and obscures the continuity of European drama. For example, the *Iphigenia in Tauris* of Euripides is a τραγῳδία, but it is not a "tragedy"; it ends happily and is, for us, as much a "romantic drama" as *The Winter's Tale* or *The Tempest.*

### HISTORY

Aristotle says that tragedy developed from the dithyramb, a choric song and dance especially associated with Dionysus. An indication of this may be found as early as 600 B.C. in the case of Arion, famous for his legendary ride on the dolphin, who is said to have composed in the Dorian city of Corinth both dithyrambs and music of the tragic style (τραγικὸς τρόπος). Certainly the Dorians of the northern Peloponnesus claimed to have originated tragedy, and it is perhaps a relic of their influence that choric odes in Attic tragedy employ Doric dialect forms. Nevertheless, the true glory of having founded tragedy was generally assigned in antiquity to Thespis of Icaria, who flourished about the middle of the sixth century B.C.

The district of Icaria at the foot of Mount Pentelicus, twelve miles northeast of Athens, was an ancient center of Dionysiac worship, and even today the village is called Dionysos. Legend has it that Icarius of Icaria was chosen by the god to spread the blessings of wine among men, but he was murdered by some shepherds who imagined, when the wine went to their heads, that Icarius had poisoned them. The festival of Dionysus at Icaria was supposedly founded to expiate this martyr's fate, and Icaria, through Thespis, may thus be considered the historical cradle of European drama, just as medieval drama sprang in part from the Church festivals of the Passion and Nativity of Christ. It is said that Thespis carted his mummers on tour about Attica and that he took the first step to turn choral lyric into drama by introducing an actor to engage in dialogue with the Chorus or its leader. Some idea of his primitive drama may perhaps still be gained from the dithyramb of Bacchylides (c. 507-430) called *Theseus,* a kind of oratorio in which King Aegeus discusses in lyric verse with a Chorus of Athenians the rumors about an unknown young hero who has appeared on the marches of Attica and is, in fact, his own lost son.

Sir William Ridgeway tried to flout ancient tradition and prove that tragedy arose from a ritual in honor not of Dionysus but of the dead. This is the reason, he argued, for the large part played in Attic tragedy by tombs, ghosts, and sepulchral rites. In fact, he was willing to ascribe a Dionysiac origin only to the satyr drama. This view, however, has not gained general acceptance, and despite the efforts of some modern critics it seems difficult to separate the origins of tragedy and the satyr drama. In any case, Dionysus himself was one of the slain gods of ancient religion who symbolize the alternate life and death of Nature through the cycle of the year; and between the worship of a dead god who lives again and the worship of a dead hero who lives still the ultimate difference is not immense.

After Thespis, Attic tragedy developed swiftly towards its brief century of triumph—from about 500 to about 400 B.C. Thespis won his first victory in the competition at the Great Dionysia in Athens in 534, but his career may well have begun much earlier, especially if there is truth in the

CULVER SERVICE

*OEDIPUS AND THE SPHINX*

FROM A PAINTING BY J. A. DOMINIQUE INGRES

story that the old statesman Solon (c. 640-560), anticipating the puritanism of Plato, the Medieval Church, and Tolstoy, denounced Thespis for daring to get up on a platform and tell lies to the public. In any case, only nine years after Thespis' first victory at Athens, there was born the first and one of the greatest of Europe's tragic masters, Aeschylus (c. 525-456), who added a second actor to the cast and thus turned tragedy definitely from lyric to drama. Now, with two actors, the dramatic clash of two personalities could begin, and since each actor could take several parts in different scenes of the same play, a more complex dramatic texture was now possible. A third actor may also have been added by Aeschylus, but it is usually Sophocles (c. 495-406) who is credited with both this innovation and the introduction of painted scenery. Sophocles is also notable for another dramatic advance, for whereas Aeschylus had written tetralogies consisting of three tragedies followed by a satyr drama, all on one consecutive theme, Sophocles wrote his four plays on independent subjects and thus was able to effect a further concentration of dramatic unity within each play. Sophocles' contemporary, Euripides (c. 480-406), basing his dramas on these structural principles, developed new tendencies—realism, romanticism, melodrama, pathos, intellectualism, humanitarianism, and rhetoric. His choral lyrics came to be more dissociated from the action of the play, but on the other hand the more elaborate music of his time found a new outlet in lyrical solos by single actors. Euripides relies less on inspiration and intuition than do Aeschylus and Sophocles, more on the critical intellect; and his general relation to his two great predecessors in some ways recalls that of Voltaire to Corneille and Racine. Less honored in his own day than Aeschylus and Sophocles, Euripides none the less exerted in later Antiquity and, partly through Seneca, during the Renaissance a wider influence than either. In the centuries after his death, Athens and then Alexandria continued to produce tragedies, but none of them has survived and none seems to have been worthy of survival.

The degree to which the future progress of European drama is already anticipated in the small fifth-century city of Athens remains astonishing, and it is all the more remarkable in view of the fact that Attic tragedy was curbed by so many more conventions and constraints than is modern drama. It was presented during a religious festival which lasted only a few days each year. With the exception of a few historical plays on recent events, like the *Fall of Miletus* and the *Phoenicians* of Phrynichus, an elder contemporary of Aeschylus, and the *Persians* of Aeschylus himself, the subjects had to be taken from an established body of heroic myths, a restriction comparable to that which a modern dramatist might face were he confined to medieval legend-cycles like those of Arthur, Alexander, and Charlemagne. The irremovable chorus of Attic tragedy, with rare and slight exceptions, also restrained the action to one place and a few hours. Verse was compulsory, and was often very complicated verse. There could be only three actors on the stage. Their faces were hidden in rigid masks. And the auditorium, though acoustically excellent, was vast enough to contain over 20,000 spectators, and these drawn from every class. Yet, despite such restrictions these dramatists mastered secret after secret of the stage: plot-construction; the clash, or the delicate contrast, of characters; the deeper dramatic interest of conflict within a character's mind; that other dramatic interest of the clash of ideas, which dominates the discussion drama of Ibsen or Shaw; tragic irony; and some measure of comic relief, not only in the burlesque satyr drama which followed the tragic performances, but also in characters like Orestes' nurse, Pentheus' messenger, or the Heracles of the *Alcestis*. They had little to learn in style, whether dialogue or lyric. They apparently composed their own music. Aeschylus and, in his youth, Sophocles were both actors. And Aeschylus, in particular, was also a master in the presentation of spectacles and crowd effects.

On the other hand it may be doubted if the admirers of Greek tragedy have not sometimes lost their sense of proportion. Aeschylus once called his plays "fragments from the great banquet of Homer," and indeed it may be felt that even in Aeschylus, and still more in his two younger rivals, some of the splendor of that Homeric banquet has passed away. It is not only that on the stage of Athens figures like Achilles, Agamemnon, Odysseus, and Helen have grown smaller and less fine than in the pages of the *Iliad* or the *Odyssey;* there is also in these Attic writers a generally narrow, less generous, less Shakespearian tolerance and understanding than in Homer. The arguments of these dramatists, and they are not always very intelligent arguments, about good and evil, right and wrong, God and man, grow at times to be tiresome compared with the quiet acceptance of the old Ionian poet, who often seems to pass over problems that vex the dramatists because he is too wise to indulge in questionings that are largely fretful and futile. The morbid guilt of Oedipus, the wranglings about the guilt of Orestes, the harshness of some of Sophocles often seem curiously primitive beside the older epic. There are times, too, when the style of Greek tragedy grows wordy, artificial, rhetorical; the line-for-line altercations of characters can become childish; and the Choruses, especially, are not exempt from a love of platitude, a preciousness of phrase, a loquacity of lamentation that make Housman's parody of Greek tragedy not

merely amusing to read but trenchant criticism as well. However it is no disgrace to be inferior to Homer. At their best, the great Attic Three have found few serious rivals, perhaps not half a dozen, in the more than two thousand years since they died.

In tragedy, as in so many literary forms, Rome faithfully followed Greece like a vast, but often dim and distorted shadow. Roman tragedy began with a Greek prisoner-of-war from Tarentum, Livius Andronicus (c. 240 B.C.), who was followed by Naevius (died c. 200 B.C.) and the more important trio, Ennius (c. 239-169), Pacuvius (c. 220-132), and Accius (c. 170-94). These last three won great acclaim in their own day, and they seem to have added to their Greek models a Roman virility, dignity, and energy that recall Corneille, but their works survive only in fragments. Lost too from the later Augustan period are the *Thyestes* of Varius and the *Medea* of Ovid, and there remain to us only the chamber dramas attributed to Nero's tutor and victim, the Spaniard Seneca (died A.D. 65), works of fourth-rate value in themselves, but, together with Plutarch's *Lives,* of vast influence on the drama of the Renaissance. In part this influence was useful. From Seneca the reviving theatre could learn again something of that Classical sense of form which the literature of the Middle Ages had largely lost. For his plays are regularly divided by their choral lyrics into five acts, whereas even in Athens the number had remained unfixed; they keep the unities of action, time, and place; their style has brevity, wit even to excess, occasional eloquence, and at least some ideas. At times this Stoic philosopher was even a poet, and descendants of the ghosts which he introduced in his plays were to people the Renaissance stage, as in *Macbeth* and *Hamlet,* with phantoms that are sometimes impressive. On the other hand Seneca's tragedies are often false, sadistic, tawdry with rhetoric and hyperbole and epigram, and thus typical examples of the cruelty of decadence, and of the havoc that unrestrained cleverness always works in poetry.

The Middle Ages had no real tragedy. The Terentian Latin dramas of the tenth-century German nun Hroswitha on Christian conversions and martyrdoms, or the Byzantine pastiches like the Χριστός πάσχων or *Passion of Christ,* of the eleventh to twelfth centuries remain mere curios. The real contribution of the Middle Ages was to prepare those elements of comedy and romance, that imaginative freedom, and that popular indifference to academic rules which were to save the drama, in Spain and England at least, from the pedantries of an overly pure Classical revival.

Italy began a long series of Renaissance imitations of Classical, and especially Senecan, tragedy with the Latin *Ecerinis* of Albertino Mussato, for which its author was crowned with laurel at Padua in 1315. Two centuries later came the first tragedies in Italian, Antonio Cammelli's *La Panfila* (1499) and Trissino's *Sofonisba* (1515), but though it has been calculated that between 1400 and 1735 Italy produced some six thousand plays and though Maffei's *Merope* (1714) is said to have run through seventy editions in his lifetime, no Italian tragedian of real distinction appeared before Alfieri (1749-1803).

In France the Classical tradition proved more fruitful. First, as in Italy, came translations of ancient tragedy or Latin imitations like those of Buchanan, in which the young Montaigne acted (c. 1540-1545). These were followed by the *Cléopâtre captive* of Jodelle (1552), who was celebrated by Ronsard and his friends with a flower-crowned goat which scandal accused them of actually sacrificing to Dionysus. In the next eighty years Garnier, Montchrétien, Hardy, Mairet, Rotrou prepared the way for Corneille, Racine, and Voltaire.

Brunetière, indeed, has claimed that only Greece and France have bred true tragedy, Shakespeare and the rest having written "drama," and it is true that in strictness of form only French Classical tragedy approaches the Greek. Indeed in some ways the French were even more rigid, for they kept strictly to five acts and to the three unities and avoided the least touch of comic relief or the slightest relaxation of ideal dignity. In Corneille the battles of will triumphant and in Racine the struggles of will overcome by passion are worked out with the logic of a chess game, and still, at their best, remain dramatic and alive. In Athens, this loftiness of tone had been maintained by the religious setting and the heroic legends taken from an aristocratic age; in France, though the drama was now condemned by religion, an aristocratic society still encouraged it as an aristocratic

*HAMLET ENCOUNTERING HIS FATHER'S GHOST*

CULVER SERVICE

form. Both the Greek and the French theatres also represent the brief triumph of a highly cultivated society, for between *Le Cid* (1636) and *Athalie* (1690) lies only half a century; yet many must feel that the perfect logic with which French tragedy can develop its plots does not compensate for its loss of the lyric beauty of the Attic writing. Nor is this loss redeemed by the French insistence on love interest. Greece had used this sparingly, but in France a delight in psychological anatomies of passion had already been stimulated by such works as D'Urfé's romantic novel *Astrée* (1607-27). None the less, though the Romantics triumphed over Classicism at last, neither Hugo's *Hernani,* nor Vigny's *Chatterton,* nor Musset's *Lorenzaccio* has succeeded in surpassing Racine's *Phèdre* or *Athalie.*

England, meanwhile, had produced a type of tragedy that was characteristically far more of a compromise and a reconciliation between ancient and medieval. Here, too, in the sixteenth century, there was first an apprentice period of Classical translations and imitations, both Latin and English, such as Legge's *Richardus Tertius* (1579) or Norton and Sackville's *Gorboduc* (1561). The triumph of Kyd's *Spanish Tragedy* (1586) and Marlowe's *Tamburlaine* (1587), however, made it clear that the English theatre, as democratic as the French was aristocratic, would maintain its freedom to multiply characters, to defy the bounds of time and space, to range from the loftiest poetry to the grossest realism, in short to indulge all those liberties without which Shakespeare himself would have been frustrated in much of his greatest work. Faguet has summed the matter up by saying that Greek tragedy concentrates on aesthetic beauty, French on reason, English on life. This seems truer than most such epigrams.

But in English tragedy the period of greatness proved even briefer than in France; Marlowe's *Faustus* and Middleton's *Changeling* are separated by little more than thirty years, and though Milton's *Samson Agonistes* may be considered as extending the period somewhat, it is an isolated work that remains as lonely and aloof as its author. The revival of tragedy under Dryden and Otway was but faint—"the second temple was not like the first"—and the centuries that followed produced little tragic drama that could long hold the stage until the Irish revival under Yeats and Synge.

Renaissance Spain preserved a like freedom in the theatre and was rewarded with the dramas of Lope de Vega (1562-1635), Tirso de Molina (1571-1648), whose *El Burlador de Sevilla* first brought Don Juan on the stage, and Calderón de la Barca (1600-1681). Germany, on the other hand, came late into this field, as into many others, for little interest attaches to the work of writers like Hans Sachs, Opitz, or Von Lohenstein, "the German Seneca." Classical influences are strong in Schiller's *Braut von Messina* and Goethe's finer *Iphigenie auf Tauris,* but both poets have left much more vivid work in the freer, more Romantic style of *Wallenstein* and *Faust.*

Since the seventeenth century perhaps the only tragic master to attain some of the universality of the Greeks and of Shakespeare has been the Norwegian Ibsen (1828-1906), whose superiority to his Swedish rival Strindberg does not seem seriously in question. Though he offers certain analogies to Euripides in his intellectual independence, a Greek would find tragedy strangely changed in Ibsen's hands. In his plays poetry has almost wholly given place to prose, and kings and heroes have become photographers and town councilors. Yet in this somber twilight of the north there relive in a new shape the ancient sense of the poetry of things and the ancient precision of form and economy in art. It becomes clear, too, that the Greek classification of tragedy as serious drama is more practical than our modern stress on unhappy endings. It would be pointless to put in separate categories *The Lady from the Sea* and *The Master Builder,* or to reclassify *A Doll's House* as a different type of play when Ibsen was temporarily forced to give it a happy ending. For modern criticism "tragedy" merges into "serious drama."

Even since the fall of Neoclassicism the influence of Greek tragedy on European drama has been considerable. It has not only produced direct imitations like Goethe's *Iphigenie,* Grillparzer's *Das goldene Vlies,* Foscolo's *Aiace,* Shelley's *Prometheus,* Arnold's *Merope,* Leconte de Lisle's *L'Apollonide,* Swinburne's *Atalanta in Calydon* and *Erechtheus,* Hugo von Hofmannsthal's *Elektra,* and Wedekind's *Herakles;* but the Greek form has also left its mark on Hardy's *Dynasts,* with its Choruses and its Aeschylean sense of doom, and the Greek concentration on reflection and states of mind rather than on abundant incident reappears in the "static drama" of Maeterlinck. Greek themes, again, have been rehandled by D'Annunzio, Gide, Cocteau, and Eugene O'Neill, and finally, it must not be forgotten that opera is a lineal descendant of Attic tragedy and that Wagner was consciously attempting to revive the Greek union of music with drama, however much the musical side might have gained in complexity since the days of Aeschylus.

## THEORY

Greece not only produced the first three great European tragedians, it also produced a theory of tragedy that has had an even greater influence. Aristotle's *Poetics* is indeed a treatise on tragedy rather than on poetry. Its value lies less in its answers, for these are often obsolete, than in the questions it asks. Thus Aristotle's definition of tragedy still pro-

vides an epitome of the famous battles of dramatic criticism from that day to this. "Tragedy," he says, "is a representation of an action which is important, complete, and limited in length; it uses language made beautiful in different ways in different parts of the play; it is enacted, not recited; and by arousing pity and fear it gives an outlet to emotions of this type."

This definition requires some elucidation. By "representation" (μίμησις) is here intended a reproduction by artificial means of the feelings produced by the real experiences of life, but this definitely does not imply realism, which the Greek stage conspicuously avoided. Moreover, an "action," as the Greeks knew and as Chekhov, for example, has shown again, may consist largely of mental events, with very little physical incident. What is "important" enough for serious drama has occasioned much angry controversy. The lovers and beggars of Euripides, Macbeth's porter or Hamlet's gravediggers, Racine's emperor hiding behind a curtain, and Ibsen's *bourgeoisie* have all been denounced as lacking in tragic dignity. But for true genius few things are common or unclean; it is the tone of the whole that matters.

The "beautiful language" of Aeschylus and Shakespeare is, on the other hand, a thing of the past, which the modern prose-bound dramatist may enviously regret. He can only try to escape from conversational realism by rhythmic prose, like Synge or D'Annunzio, or by the poetry not of language but of things and symbols, like Ibsen or Chekov.

Instead of "enacted, not recited" Aristotle should have said "enacted *rather than* recited," for Greek tragedy is full of messengers' speeches. In considering this portion of Aristotle's definition we are faced with the long battle of the unities: can we follow events, leaping over time and place, or must all events outside one spot and a few hours be recounted and not performed? The real reason for the unities of time and place disappeared with the immovable Chorus, but Renaissance pedantry loved rules regardless of reasons and chose to uphold the unities on the psychologically absurd ground of realism, as if the human imagination were a snail. The blunt good sense of Samuel Johnson finally disposed of the misconception that the unities were necessary to illusion, and if modern playwrights like Ibsen have sometimes returned to a partial observance of the unities of time and place, it has been simply for aesthetic neatness and concentration: the age of the cinema cannot suppose that they are needed to create a sense of reality. Furthermore, the film can now enact situations too difficult for any stage.

Last comes the famous question of the psychological effect of tragedy. Aristotle's *catharsis,* or purgation (*not* "purification"), is a frankly medical metaphor. Plato had condemned poetry for making men too emotional; Aristotle retorts that by providing a safety-valve tragedy prevents men from becoming too full of repressed emotions. This is typical of the unascetic good sense of the Hellenes: "nothing too much," they believed, neither too much emotion nor too much restraint, and Apollo must stand beside Dionysus. But though Aristotle has answered Plato, he has not answered us: we do not go to the theatre to be purged, but because we like it. But why do we like to watch suffering? Because we are malicious, said Rousseau, just as in comedy our pleasure is indicated by malicious laughter. There is some truth in this; but it is not the whole truth, or why should an audience weep with sympathy? Schopenhauer thought that tragedy appealed by revealing the true vanity and wretchedness of life. But audiences do not consist of Schopenhauers. Hegel found tragedy satisfying because it is not really tragic at all, and life's seeming tragedies really end happily in a higher

synthesis. In the *Antigone,* for example, although Sophocles would have been much astonished to hear it, Antigone and Creon are both right, but not right enough. Their destruction is therefore just, and pity, for which Hegel, indeed, had no use, would be misplaced.

For Nietzsche, the power of tragedy lay in its combination of our two impulses, the splendid Apollonian joy of creation and the dark Dionysiac lust to destroy and be destroyed. This too has its truth. But is it not perhaps enough to say that we go to see *Hamlet* or *The Three Sisters* for the sake, not of purging emotion, but of having it? We value an emotional experience because to feel more intensely, though not too intensely, is to be more intensely alive. Moreover, we gain in the theatre the wider experience of living other lives besides our own, and in this experience, which we value as we feel it to be essentially true to life, we test and deepen our own values and beliefs and sympathies. Finally, we feel, amid all the misery and folly and perversity of men, what fineness, what lovableness, and what courage are also there. In the words of Synge's Deirdre, as she stabs herself, "It is a pitiful thing, Conchubor, you have done this night in Emain; yet a thing that will be a joy and triumph to the ends of life and time."

Aristotle usefully divides serious drama into six elements: plot and character; diction and ideas; and the musical and the spectacular. The musical element provided by the Chorus is the oldest and has long vanished except in opera. From Aeschylus to Euripides we can already watch the rapid decline of the Chorus, as the tribal group from which tragedy sprang becomes less and less important and the individual more and more so. In the earliest extant play of Aeschylus

the members of the Chorus are themselves the heroines; in Euripides they fade to shadowy voices, whose lyrics provide a far-off poetic relief to the sorrows of the play's protagonists. In Elizabethan or modern drama the task of the Chorus is taken over, on the whole to advantage, by minor characters like Enobarbus in *Antony and Cleopatra,* by clowns, by First and Second citizens, by songs, by soliloquies, by confidants, or by *raisonneurs.* In Chinese drama, as in Aeschylus, a curious convention permitted the hero or heroine to act also as Chorus by singing their reflections at appropriate intervals.

Plot, Aristotle insists, must have a "beginning, middle, and end"; it must, in other words, be a well-defined, logical whole. French tragedy obeyed this rule scrupulously: Shakespeare smiled, and produced vast and illogical but magnificent excrescences like Falstaff; modern dramatists are less audacious. The most moving devices in a plot, Aristotle continues, are *peripeteia* and *anagnorisis,* which are usually mistranslated as "reversal" and "recognition." A *peripeteia* is an ironic frustration of purpose, producing an exactly opposite result from what was intended, as when Dejanira poisons her husband with the love philter that was to win him back to her or as when Lear puts himself at the mercy of the daughters that hate him and casts out the one that loves. The *anagnorisis* is wider than "recognition"; it is any "discovery" of the true situation. In other words, for Aristotle the most effective plot is that in which men's purposes are frustrated by their own blindness in a tragedy of errors, whose essence is tragic irony. The tragic error itself is Aristotle's famous *hamartia,* which may be a fault either in morals, like Antony's, or in judgment, like Othello's. Through it men ruin their own selves or those they love best, and this, as Aristotle justly points out, is more tragic than enemy ruining enemy or than the catastrophes of chance.

*Edmund Gwenn, Gertude Musgrove, Judith Anderson, and Katherine Cornell in a scene from* The Three Sisters *by Anton Chekhov*

This analysis of Aristotle's, with its stress on the irony of things, is amazing in its quiet logic and the light it throws on serious drama from Aeschylus to Ibsen. His emphasis on plot rather than character as "the soul" of serious drama seems more dubious. Corneille and Racine might have agreed; Shakespeare would not, for his plots are often lame and are saved only by characterization and sheer poetry. A thoroughly good skeleton is, indeed, most desirable for any human being, but the very best of skeletons is a limited blessing compared with the infinite possibilities of mind and character. In Chekov or Pirandello, indeed, the "action" takes place largely in the characters' own minds.

On character Aristotle is less illuminating. Character, he stipulates, should be true to type, or, as we should prefer to say, "convincing"; it should be consistent and as good as the plot permits. Here the overmoralistic bias of ancient criticism reveals itself; yet Aristotle is objecting to needless vileness and not always without good reason. On the other hand, the hero or heroine, he thinks, should not be quite faultless, for if they are, their unhappiness will revolt us. The true objection to faultless characters, however, is rather that they are themselves unbearable and not that their sufferings are. Aristotle's insistence that characters should also be of high estate is, of course, obsolete, though French tragedy long clung to it, and may be considered a relic of those religious origins of tragedy which concerned it with gods or heroes.

The style of tragedy, according to the *Poetics,* should be clear but not mean. Too many ordinary words make it mean, too many strange words make it jargon. The saving grace is metaphor, which can lend imaginative magic even to ordinary words. Of that, Shakespeare provides a vivid example. And even though verse in drama has given place to prose, there remains deep truth in this simple precept, as may be seen in the style of Synge's peasants, who have not worn out their language as the mechanically educated have done.

On the spectacular Aristotle is brief, but sound. It has its place; but it can easily encroach. Here, also, time has only too often proved him right.

In our own day the depressing view has been put forward that modern man is too insignificant for tragedy. Ibsen has already answered this contention. It is the tragic dramatist's own greatness that matters. Fine drama remains rare because it requires not only dramatic genius but dramatic audiences and other conditions which genius by itself cannot control. Unless the tyranny of totalitarianism should degrade mankind to the mass mentality of the servile state, there seems not the slightest reason that stage and film should not still produce tragic masterpieces. But the history of twenty-five centuries has shown tragedy to be like a sour aloe that is shy to flower and quick, when it has flowered, to die again.

**TRAHERNE, THOMAS** [trəhɜ′rn] (c.1637-1674), English writer, was born and reared in Hereford, where his father was a shoemaker. He was educated at Oxford and in 1657 was appointed rector of Credenhill, Herefordshire. Later he became chaplain to Sir Orlando Bridgeman, the Lord Keeper, and in 1672 accompanied him into retirement at Teddington, Middlesex. There Traherne died on or about Sept. 27, 1674.

During his short, quiet life, Traherne was not known as an author, for he had published only one book, an attack on Roman Catholicism entitled *Roman Forgeries* (1673). Two other prose works published later in the century did nothing to advance his reputation. The manuscripts of his literary prose and verse were, however, miraculously preserved until their discovery in a London bookstall in 1897, and the *Poems* were finally published in 1903. The *Centuries of Meditations* appeared in 1908, and two years later another collection, *Poems of Felicity,* was published from a manuscript that had lain neglected in the British Museum.

Although the poems have received more attention than the prose, some critics believe that, because of the technical

defects in Traherne's verse, his meditations are superior. In both forms, his thought is the same: true spiritual felicity is to be found in a mystical approach to God through a child-like enjoyment of nature and of people. H. B. W.

**TRAIL,** a city in British Columbia, Canada, situated on the Columbia River, about 250 mi. east of Vancouver, and served by the Canadian Pacific Railway. Founded as a small smelting town in 1895, it was the largest smelting center in Canada in 1947 and had one of the largest nonferrous metallurgical plants in the world. Lead, zinc, silver, gold, bismuth, antimony, tin, indium, and cadmium are produced. Fertilizers are also an item of the city's factory output. Pop. 1951, 11,430. D. G. G. K.

**TRAILER COURTS. Development of the Industry.** The trailer industry was born during the depression years after 1929. The earliest trailers were crude, home-built affairs primarily used for vacation trips and occasionally for housing. The first commercial manufacture of a house trailer was undertaken in 1930 by Arthur G. Sherman, who formed the Covered Wagon Company for this purpose. Public reaction to the early trailers was not too favorable, but as the size and comfort of the mobile homes increased, so did the public demand for this new type of lodging. By 1936 there were in use 250,000 trailers, housing nearly a million people. About 60 per cent of this number appeared to have been constructed in someone's back yard. Phillip H. Smith wrote of the interest in trailers in 1938, "the dwellings were regarded as a solution to the economic problems of the day by offering an opportunity to escape the drudgery of city congestion, to elude the tax collector, to avoid the payment of rent, to seek greener pastures in other sections of the country, or to satiate the desire for a gypsy-like way of life."

The industry prospered during the 1930's and by 1940 was considered to be the fastest growing business in the United States. At this time, purchasers of trailer homes fell into three principal groups: (1) vacationers, (2) retired individuals, and (3) people engaged in migratory occupations. With more and more trailers going into use, facilities to service and park them became an absolute necessity. Thus, in the late thirties, appeared many of the country's first trailer courts.

The advent of World War II started the real boom in trailer sales. As defense plants expanded, thousands of workers who migrated to these areas were unable to find housing. Many purchased trailers. The government purchased thousands of the homes on wheels and established regular housing developments around arsenals, defense factories, and later around armed service centers in an attempt to alleviate the housing shortage. The close of World War II brought on an even greater scarcity of living quarters, accompanied by inflationary price structures. The demand for trailers was increased both by this fact and because of the rapid strides made in creating new trailer designs which offered added comfort, convenience, and luxury. The demand has increased since 1946 until there are now 900,000 trailers in active use. For 1955, production of trailers reached the all-time high of 100,000 units.

**Trailer Courts Today.** At present there are 14,000 trailer courts in the United States. There is tremendous variability in both size and quality of these courts. The average court contains 30 to 35 units and the owner's investment approximates $32,000 or $1,000 per unit. Many courts contain only 10 units, but the range is from 7 to 1,500 in privately owned operations. The largest trailer court in the world was located at the government project in Aiken, S.C. It accommodated 4,000 trailers. The Kiwanis Park in Bradenton, Fla., with its 1,500 units, is the largest privately owned court.

The quality of a court is based upon its attractiveness of appearance and the completeness of its facilities. The Mobile Homes Manufacturers Association rates the courts periodically and provides a listing of approved courts for the general public in much the same manner that the American Hotel Association and the Automobile Association of America list approved hotels and motels. Less than 50 per cent of the country's trailer courts now carry the MHMA stamp of approval.

American trailer courts are of three types: (1) the transient park, (2) the permanent park, and (3) the resort park. Theoretically all parks service transients but in reality only 75 per cent do. The transient park has a rapid turnover of customers and is usually not so elaborate as the other two. The permanent park is comparable to a housing development and the park's customers are really citizens of the community. Here, the trailer will often have its wheels removed and be placed on a permanent foundation. A percentage of the trailers may be owned by the park operator and rented just as one would rent a house. This style operation is not typical and is found primarily in college communities. The resort park is quite elaborate. Very often a swimming pool, recreation facilities, and even a shopping center will be available in addition to the usual court services. Resort courts are located principally in Florida, California, and many of the national parks.

WIDE WORLD PHOTO

*A STREET IN A TRAILER COURT, TYPICAL OF THIS KIND OF COMMUNITY*

The traveler who stops at a trailer court can be certain that electricity and water service are available, while 75 per cent of the approved courts have sewer service. Where sewer facilities are unavailable the court always provides a utility building which satisfies all the basic needs of the customer. The usual charge at a trailer court is $1.25 per day, including utilities.

The heaviest concentrations of trailer courts are in the South, the Midwest, and the Southwest. Construction workers, members of the armed services, retired people, and a rapidly increasing group that prefer trailer living as a way of life are the chief purchasers of trailers, with the fastest growing market provided by retired people.

Where communities once looked with disfavor on tourist courts, they now recognize them as an asset. The residents of these parks spend money in the community and are, for the most part, solid citizens. Recent surveys show the trailer

resident's income to be $1,500 above the per capita average for the United States, and the juvenile delinquency rate for his children to be below the national average. That this new way of life has wide appeal is attested by the fact that 3,000,000 people now reside in mobile homes. G. W. L.

*Trajan's Column, a monument of marble which rises more than one hundred feet above the court between the temple and basilica in Rome's Forum of Trajan*

Trajan the territory of Rome reached its greatest extent. His wars with the Dacians (101-106) ended with the incorporation into the empire of all Dacia, in the Danube Valley. His Parthian wars (114-116) carried the Roman standard to the Persian Gulf. As the result of other annexations, the kingdom of the Nabataean Arabs became the Roman province of Arabia, and provincial status was likewise accorded the defeated Armenians. While the condition of imperial finance was improved by the acquisition of the Dacian treasury and the revenue from the Dacian gold mines, an extensive public works program provided the empire with new roads and better harbor facilities. In addition to the new forum which Trajan built at Rome, mementoes of his reign are the famous column at Rome which commemorates his Dacian victories, and the equally well known arch at Beneventum. Despite the lack of full and original literary sources for the reign of Trajan, it is known that he was personally popular and preserved good relations with the Senate; the army was happy and contented under this competent and successful leader. A darker side of the period is seen in the increasing prestige of the executive at the expense of the Senate; the lack of initiative in the case of the provincial governors and their utter dependence on the emperor is clearly shown in letters written to Trajan by the younger Pliny, governor of Bithynia. Trajan died at Selinus, in Cilicia, Aug. 8, 117.

**TRALEE** [trəli′], or Traighli, a seaport and the county town of County Kerry, Munster, Ireland, situated about 54 mi. southwest of Limerick (Luimneach), in a farming district. The town developed from a Dominican monastery established in 1213. There is a canal connecting the community with Tralee Bay, but incoming ships over 200 tons must dock at Fenit, 8 mi. westward, and the goods are shipped by rail to Tralee. There is a large trade in dairy products at Tralee. Pop. 1951, 11,045. A. W.

**TRANSCAUCASIAN SOVIET FEDERATED SOCIALIST REPUBLIC,** a federation of the Union of Soviet Socialist Republics established in 1923 and abolished in 1936.

At the end of World War I three independent countries were established in the Transcaucasian section of Asia: Armenia (Erivan), Azerbaidzhan, and Georgia. In January 1920 the Allied Powers accorded de facto recognition to them, and treaties delimiting boundaries were signed with Turkey. Although the formal independence of these countries was thereby accepted, they appeared to be under Russian control: in April the Azerbaidzhan government was overthrown by an internal revolution and replaced by a Soviet Republic; in December a Soviet government was established in Armenia; and a disturbance in January 1921 caused Russian troops to enter Georgia, where the organization of a Soviet Republic was announced in March. On Mar. 12, 1922, the three Soviet governments created the Transcaucasian Soviet Socialist Republic, an independent unit, and on July 6, 1923, the republic became the Transcaucasian Soviet Federated Socialist Republic, one of the four original federated republics in the Union of Soviet Socialist Republics. The area of the federated republic was 71,300 sq. mi. Under it were organized the Nakhichevan Autonomous Soviet Socialist Republic, the Nagorny Karabakh Autonomous Oblast, the Abkhazian and Adzhar Autonomous Soviet Socialist Republics, and the South Ossetian Autonomous Oblast. In December 1936 the federation was dissolved, largely because of stress arising from its ethnographic complexity, but the three constituents remained in the Soviet Union as individual republics. Their combined area, however, is spoken of today as Transcaucasia.

**TRANSCENDENTALISM** [tra′nsɛndɛ′ntəlɪzəm], a philosophical theory that postulates the existence of realities which, though they are beyond the reach of the senses and the understanding, the mind may nevertheless apprehend by direct intuition. "Transcendentalism" is most commonly used in America, however, to designate a cultural and philosophical movement that flourished in New England during the second and third quarters of the nineteenth century. The movement is indirectly and loosely traceable to German idealism, but it has its deeper roots in a revolt against the skeptical implications of classical British philosophy. Although sporadic traces of it can be discovered during the first quarter of the century, its first coherent expression is found in James Marsh's introduction to the first American edition of Samuel Taylor Coleridge's *Aids to Reflection,* in

1829. Marsh, who had some acquaintance with German philosophy, elaborated a distinction between the understanding and the reason somewhat after the manner of Immanuel Kant.

In the summer of 1836 a few young men, including Frederic Henry Hedge, George Ripley, Amos Bronson Alcott, and Ralph Waldo Emerson, joined together with the avowed purpose of finding a more satisfactory basis for their beliefs than the "sensualism and materialism" of Locke. This little group came to be called the Transcendental Club, and in the next three or four decades most of the literary, philosophical, social, and religious leaders of New England were connected in one way or another with the movement. The literature of American Transcendentalism consists of poetry, fiction, orations, sermons, and essays.

Ralph Waldo Emerson, who became the acknowledged leader and spokesman of the movement, was the descendant of a distinguished line of New England ministers and was, in a sense, a product of the New England Puritan church tradition. Instead of pursuing an ecclesiastical career, however, he resigned his pulpit in 1832 for doctrinal reasons and settled in Concord, Mass., for the remainder of his quiet and contemplative life. In 1836 he published his first work, *Nature*. In this brief prose poem the reader finds little information about nature. Instead, he is introduced to the doctrine that man, through his inner perceptions, is one with all men; all men are one with nature; and nature is one with God. This was the theme of Emerson's poems and essays throughout the remainder of his life. He had found a text suited to his thought that truth is the expression of spiritual or personal insights rather than a deduction from premises provided by history and science. Transcendentalism is, thus, essentially a moral philosophy. In proclaiming the dignity of the individual man, it cut the roots of institutional tyranny and turned the mind to imagination, hope, exploration, and self-reliance. Transcendentalism also had a socialistic strain, which established a bond between many Transcendentalists and the various social, political, and religious reform movements of the day, but in Emerson's thought, and in that of his friends Henry David Thoreau and William Ellery Channing, socialistic ideas were strictly subordinate to a radical individualism. H. G. T.

**TRANSCONA** [transko'nə], a town in Manitoba, Canada, served by the Canadian Pacific and the Canadian National railways, 7 mi. east of Winnipeg, of which it is a suburb. It is an important railway center, and large shops of the Canadian National Railways are in the town. Other industries include an explosives plant, a malting factory, and grain elevators. It is the site of two power stations. Pop. 1951, 6,752. L. G. R.

**TRANSFORMERS,** stationary apparatus for transferring electrical energy from one alternating-current circuit to another without change of frequency, through the medium of a magnetic field. The transformer may step up the voltage (step-up transformer), it may step down the voltage (step-down transformer), or the energy may be delivered at the same voltage as that at which it is received (one-to-one transformer). Transformers have a high efficiency, from 97 per cent in the smaller ratings to over 99 per cent in the higher ratings; they are rugged, and the cost per kilovolt-ampere is relatively low.

The transformer consists of a core made up of laminations, usually of silicon steel (*See* Fig. 1). There are two windings on the core, the primary $P$ and the secondary $S$. For simplicity, the windings are shown on separate sides or legs of the core. Actually, with this arrangement there would be considerable magnetic flux (lines of force) linking one winding but not the other, with a consequent loss of flux called leakage flux. With this arrangement the transformer would regulate poorly. In practice, the primaries and secondaries are located close together, as in Fig. 2.

In Fig. 1 alternator $A$ supplies an alternating current $I_0$ at voltage $E_1$ to the primary winding $P$. At the instant shown, the current in the upper conductor is positive and increasing, and the primary winding produces a flux $\phi$ in a clockwise direction around the core. This flux $\phi$ which links both windings is called the mutual flux, the alternation of which induces an electromotive force (e.m.f.) in both the primary and the secondary. The e.m.f. induced in the primary is a counter e.m.f. which opposes current entering the primary and corresponds to the counter e.m.f. of a motor. The e.m.f. induced in the secondary is available for delivering energy from the secondary and corresponds to the e.m.f. of a generator.

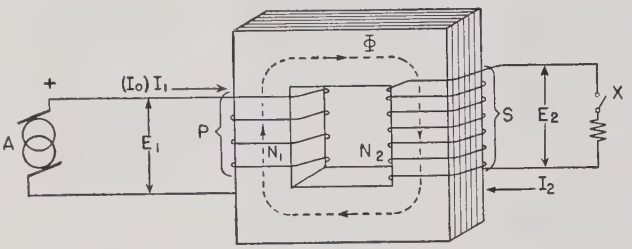

*Fig. 1—PRINCIPLE OF THE ELEMENTARY TRANSFORMER*

The induced e.m.f. in a transformer winding is given by $E = 4.44\,\phi_m f N \phi\ 10^{-8}$ volts, where $\phi_m$ is the maximum instantaneous value of the flux $\phi$ in maxwells, $f$ is the frequency in cycles per second, and $N$ is the number of turns. Since $\phi_m$ is common to both windings, it follows that the induced e.m.f. in each winding of a transformer is proportional to its number of turns. That is:

$$\frac{E_2}{E_1} = \frac{N_2}{N_1}.$$

In the usual transformer, the terminal voltages differ from the induced e.m.f.'s by only a few per cent, so that for most practical purposes the terminal voltages are practically proportional to their numbers of turns, $V_2/V_1 = N_2/N_1$.

The current $I_0$ which flows at no load produces the flux $\phi$ and in conjunction with the impressed voltage supplies the eddy-current and hysteresis losses in the core. At no load, the primary copper loss $I_0^2R$ is negligible. The current $I_0$ is called the exciting current and is usually 1 to 2 per cent of the rated current of the transformer, although in 25-cycle transformers it may reach 5 or 6 per cent.

If the switch $X$ in the secondary circuit of Fig. 1 is closed, the secondary delivers current. By Lenz's law, the direction of the secondary current is such as to oppose the flux $\phi$. When the flux $\phi$ is reduced, the primary counter e.m.f. $E_1$ is reduced and more current flows into the primary to supply the power which the secondary delivers. The counter e.m.f. $E_1$ differs from the impressed voltage $V_1$ by only 1 or 2 per cent. $V_1$ is constant. If $E_1$ remains essentially constant, the mutual flux $\phi$ remains essentially constant, and hence the net ampere-turns acting on the core remain essentially constant. Thus, the secondary ampere-turns which are added when load is applied to the secondary must be balanced by opposite and practically equal primary ampere-

turns. The exciting current is small compared with the load currents and is usually well out of phase with them. Hence, it may be said that the primary and secondary ampere turns are opposite and equal; that is:

$$N_2 I_2 = N_1 I_1, \quad \text{and} \quad \frac{I_2}{I_1} = \frac{N_1}{N_2}.$$

Thus, in a transformer the currents are practically inversely proportional to the turns in their respective windings.

**Regulation.** Fig. 2 shows a sectional view of one leg of a transformer with the associated primary and secondary coils *P* and *S*, the primary lying outside the secondary. Even though the coils are wound close together there is a certain amount of flux $\phi$, which is produced by the primary current and which encircles or links only the primary coil *P;* this is called the primary leakage flux. Similarly, there is a secondary leakage flux. These two fluxes produce reactance

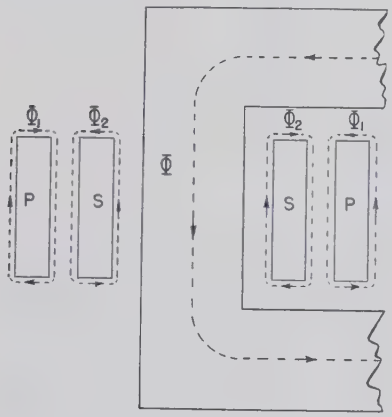

*Fig. 2—SECTIONAL VIEW OF ONE LEG OF A PRACTICAL TRANSFORMER*

drops in their respective windings, which in combination with the resistance drops decrease the secondary terminal voltage with application of load.

The primary and secondary resistance are reactances which can be used individually, or they can be combined into a single equivalent resistance and a single equivalent reactance referred to either side in determining the regulation. Thus, in Fig. 3, $V_1$ is the primary terminal voltage, and $I_1$ is the primary current lagging behind, $V_1$ by $\theta$ degrees. $I_1R_{01}$, in phase with $I_1$, and $I_1X_{01}$ in quadrature (displaced by 90 deg.) with $I_1$ and leading, are added vectorially to $V_1$ to obtain $E_1$. The value of $E_1$ is then:

$$E_1 = \sqrt{(V_1 \cos\theta + I_1R_{01})^2 + V_1 \sin\theta \mp I_1X_{01})^2} \text{ volts.}$$

With leading current the minus sign is used. In the case of unity power factor $\cos\theta = 1$ and $\sin\theta = 0$. The regulation is:

$$\frac{E_1 - V_1}{V_1}.$$

When referred to the secondary, $R_{02} = R_{01}(N_2/N_1)^2$; $X_{02} = X_{01}(N_2/N_1)^2$. The foregoing equation then may be employed, using secondary voltages and currents that give the same regulation. The resistance and reactance drops range from about one to three per cent of the terminal voltage and in Fig. 3 are exaggerated for clarity.

The efficiencies of transformers are so close to unity that poor precision is obtained if direct measurement of output and input is made. A more precise method is to compute the efficiency input from the losses, determining the core loss $P_c$ by measuring at no load the power to either winding when that winding is operating at rated voltage. The efficiency ($\eta$) then follows as:

$$\eta = \frac{V_1 I_1 \cos\theta}{V_1 I_1 \cos\theta - I_1^2 R_{01} - P_c} = \frac{V_2 I_2 \cos\theta}{V_2 I_2 \cos\theta - I_2^2 R_{02} - P_c}.$$

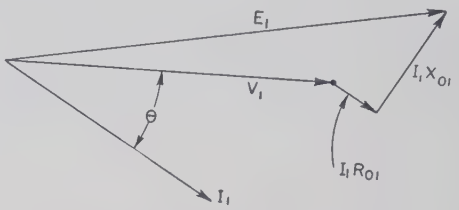

*Fig. 3—VECTORIAL REPRESENTATION OF REGULATION*

**Autotransformers.** An autotransformer is defined as a transformer in which part of the winding is common to both the primary and secondary circuits. When the ratio of transformation is low, considerable saving in cost and an increase in efficiency over the conventional two-winding transformers are obtained.

Fig. 4 (*A*) shows a 2:1 autotransformer. Unity power factor is assumed, and losses and exciting current are assumed to be negligible. The winding *ac,* continuous on a transformer core, may be split into two or more coils on opposite legs of the core. To obtain a 2:1 ratio, a tap *b* is taken from the mid-point of the winding *ac,* and the secondary load is connected between the points *bc*. For power transformation, the winding *ab* is the primary and the winding *bc* the secondary. Assume that the load current *I* is 20 amp. at 50 volts. A current of 10 amp. flows from *a* to *b* and thence to the load *dd'*. The power, represented by the current of 10 amp. dropping 50 volts, is 500 watts, which goes into the magnetic field in the core and reappears by raising

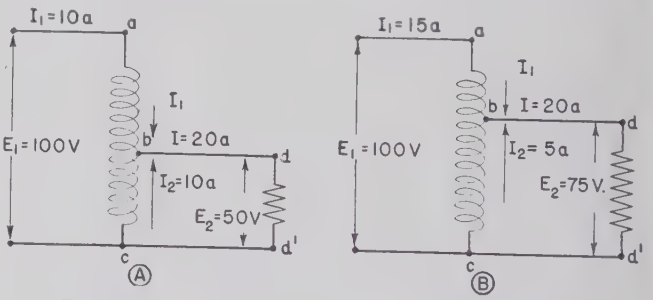

*Fig. 4—TRANSFORMER ACTION IN AN AUTOTRANSFORMER*

the 10 amp. $I_2$ by 50 volts from *c* to *b*. Hence, of the total power to the load of 1,000 watts, 500 watts flows conductively from *a* to *b* without transformation, and 500 watts is transformed. With the usual two-winding transformer not only would the winding *ac,* rated at 100 volts and 10 amp., be necessary but also a secondary winding rated at 50 volts and 20 amp. having an equal amount of copper would be necessary. Moreover, with a single winding, less iron is required for the core. Hence, in the autotransformer with a 2:1 or 1:2 ratio, the material required is half that for the usual two-winding transformer, and the losses are also about one-half.

Fig. 4(*B*) shows an autotransformer with a 100-volt primary and a 4:3 ratio. The secondary load is 20 amp. at 75 volts, so that the output is 1,500 watts. Hence, the primary current must be 15 amp. The tap *b* is located at a point corresponding to three-fourths the number of turns

from $c$ to $a$. A current of 15 amp. flows from $a$ to $b$ and thence to the load $dd'$. This current, in dropping 25 volts from $a$ to $b$, gives $15 \times 25$ or 375 watts to the magnetic field, and reappears in raising 5 amp. by 75 volts from $c$ to $b$, corresponding to a power of 375 watts. Hence, in this transformer only 375 watts are transformed, and the remainder, 1,125 watts, flows conductively from the 100-volt to the 75-volt circuit. Therefore, this transformer need be only one-fourth the rating of the usual two-winding transformer that would transform all the power.

If $n$ be the ratio of low-voltage to high-voltage e.m.f., the ratio of the power transformed to the total power delivered is $(1 - n)$. Hence the ratio of the rating of the autotransformer to the usual two-winding transformer is $(1 - n)$. Thus, in Fig. 4($A$), $n$ is equal to $\frac{1}{2}$ and the rating of the transformer is $(1 - \frac{1}{2})$ or one half that of the usual two-winding transformer. In Fig. 4($B$), $(1 - n) = (1 - \frac{3}{4}) = \frac{1}{4}$, and the rating of the autotransformer is one fourth that of the usual two-winding transformer.

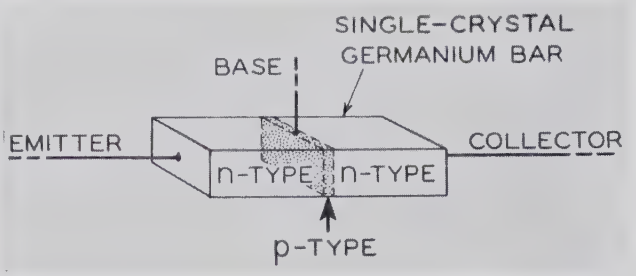
Autotransformers are used in power systems to effect transformations of moderate ratio, such as 2:1 or 1:2. They are also used for motor starters, for "balance" coils, and for innumerable other purposes in which moderate power ratios are sought.

**Instrument Transformers.** It is difficult to make measurements at high voltages, since high-voltage instruments are expensive and usually unwieldy, "static" may affect the accuracy, and there is danger to the operator. When the current exceeds 60 amp., it is difficult to construct accurate-reading ammeters on account of the large wires, and the errors due to the stray field of the leads become too large. Also, ammeters and current coils in high-voltage circuits are dangerous to the operator and are subject to "static" errors. By the use of potential and current transformers, the instruments are insulated from the high voltage and voltage coils rated at 110 volts, and current coils rated at 5 amp. can be used. The secondaries should be grounded as shown. Unless the scales of the instruments are calibrated in terms of the transformer ratios, the voltmeter reading must be multiplied by the potential-transformer ratio, the ammeter reading by the current-transformer ratio, and the wattmeter (and watt-hour meter) reading by the product of the potential- and current-transformer ratios. C. L. D.

**TRANSISTOR,** a solid electronic device, capable of performing most of the functions of a vacuum tube and of operating on very small amounts of power. It was called a transistor because it is a re*sistor* or semiconductor device which can amplify electrical signals as they are *trans*ferred through it. Semiconductors are neither good conductors of electricity as are the metals (copper and silver), nor are they good insulators, like rubbber.

The word "transistor" is now used as a generic term for an ever-growing family of semiconductor amplifiers. Although transistor technology is undergoing rapid change, the basic theory which resulted in the invention of the device remains the same.

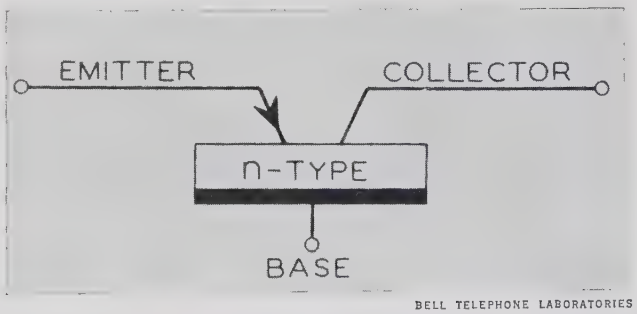
This device was invented at Bell Telephone Laboratories in 1948 by John Bardeen and Walter H. Brattain. It was not discovered by "accident." William Shockley, a physicist, had predicted the possibility of controlling the meager supply of movable electrons inside a semiconductor by influencing them with an electric field imposed from the outside without actually contacting the material. The first type of transistor to be developed is now called a point-contact transistor. It consists of two thin wires spaced a few thousandths of an inch apart and resting on a tiny wafer of germanium. The flow of current in one of the fine points controls the flow in the other.



*THE POINT CONTACT TRANSISTOR*

Shortly after the invention of the point-contact transistor, the "junction" transistor was predicted theoretically by Dr. Shockley. Its development was announced by Bell Telephone Laboratories in 1951. This type of transistor can be built to occupy only about 1/400 of a cu. in. and can operate on less power than the original point-contact device. It consists essentially of a tiny sandwich of germanium or silicon, treated so that alternate layers have different electrical properties. The boundaries, or junctions, between the regions in the crystal serve the same functions as the two points in a point-contact transistor.

A crystal of silicon or germanium with a perfect electron-pair bond structure would normally act as an insulator. In order that conductivity of the electric current may occur, imperfections are necessary in the atomic structure of the crystal. These are introduced in the form of atoms of materials, such as boron, arsenic, and indium, and may amount to as little as one part in 100,000,000. Depending on the impurity used, the crystal may then have an excess of electrons or a deficiency of electrons. The first is called the $n$-type transistor—$n$ for negative—since the electron is a negatively charged particle; the second, the $p$-type—$p$ for positive.

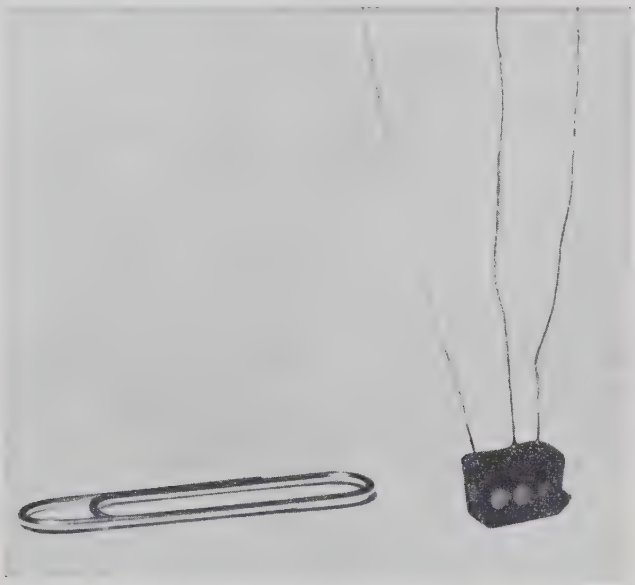


*THE* n-p-n *JUNCTION TRANSISTOR*

Most of the electrons in a semiconductor do not contribute to carrying the current at all. They are held in fixed positions and act as a rigid cement to bind together the atoms in a solid. If, however, one of these electrons gets out of place or if another electron is introduced in one of a number of ways, current can be carried. Also, if one of the electrons normally present in the "cement" is removed, the "hole" left behind it can move like a bubble in a liquid and, thus, carry current.

The transistor is much smaller than electron tubes of equal power capability. Like electron tubes, it will serve as an amplifier or an oscillator. The advantages in its use are that it is rugged, with a long life expectancy, and that

it has no grid, no plate, and no cathode. Lacking these elements, the transistor will operate instantly without the need for a warm-up period.



BELL TELEPHONE LABORATORIES

*THE JUNCTION TRANSISTOR COMPARED IN SIZE TO A PAPER CLIP*

**TRANSIT,** in astronomy and geodesy a term used in several meanings. (1) The transit of a celestial body is usually its passing over the observer's meridian. Upper transit is the crossing over the meridian passing through the zenith; lower transit is the crossing of the antemeridian, or meridian passing through the nadir.

(2) In general, transit is also the crossing of a body over an apparently larger body, as the transit of Venus over the sun's disk.

(3) In geodesy, transit refers to an engineer's instrument for surveying work. A larger and more elaborate instrument used in observatories is the transit instrument. This is a precision instrument, used for observing star transits across the meridian to determine time. H. S. R.

**TRANSITION ELEMENT,** a term applied to three groups of elements in which there is a change in an inner rather than an outer electron shell as the atomic number increases.

The first transition series runs from scandium, element number 21, to zinc, element 30. The structure for scandium is $1s^2 - 2s^2 - 2p^6 - 3s^2 - 3p^6 - 3d^1 - 4s^2$; and the number of 3d electrons increases as follows: $Sc = 3d^1$; $Ti = 3d^2$; $V = 3d^3 4s^2$; $Cr = 3d^5 4s^1$; $Mn = 3d^5 4s^2$; $Fe = 3d^6$; $Co = 3d^7$; $Ni = 3d^8 4s^2$; $Cu = 3d^{10} 4s^1$; $Zn = 3d^{10} 4s^2$. Excepting the abnormalities of chromium and copper, the members of this transition series differ essentially in the number of 3d electrons. There is a gradual change in some physical properties: the density rises from 2.5 for scandium to 8.9 for copper; the m.p. falls from 1,800° for Ti to 1,220° for manganese; the ionization potentials are between 6.7 and 7.8. The readiness of shifting the 3d level electrons results in most compounds in this series being highly colored. The elements are characterized by variable valence; probably for this reason they are useful catalytic agents, since the mechanism of catalysis often involves a change in valence. The transition elements iron, cobalt, and nickel in Group VIII of the periodic table are particularly similar in properties, although iron tends to exist in the ferr*ic* state, cobalt as *-ous* and *-ic,* and nickel only as *-ous.* These three elements are intermediate between chromium and manganese, on the one hand, in which all the 3d or transition electrons may be removed, as in chromate and permanganate; and copper and zinc, on the other hand, in which one or none, respectively, of the 3d electrons may be taken away.

The second transition series runs from yttrium, element 39, through cadmium, element 48. In these the number of 4d electrons is increasing with certain abnormalities, from 1 through 10.

The third transition series begins with the rare earths or lutetium, element 71, and runs through mercury, element 80. In these, the 5d level is increasing with certain abnormalities from 1 to 10.

Many interesting interrelationships exist between elements of these three transition series. They are characterized by variable valence, colored compounds, and ability to form coordinate compounds such as the ammine complexes. The +6 compounds of iron, ruthenium, and osmium resemble those of chromium, molybdenum, and tungsten. Nickel, palladium, and platinum resemble copper, silver, and gold. The textroxides of ruthenium and osmium are volatile. Nickel, palladium, and platinum absorb hydrogen in large quantities. *See also* ATOMIC STRUCTURE; PERIODIC TABLE.

H. N. A.

**TRANSJORDAN,** now called **JORDAN,** a kingdom in the Near East, at the northwest corner of the Arabian peninsula. Transjordan was so named because it originally comprised the region directly east of more populous Palestine and the Jordan area; the name became a misnomer as a result of the country's claim to areas not "across" (*trans*) the Jordan, but on both sides of that river. Jordan's status as a nation derives from the recognition by the French government in 1920 that it was not part of their mandate of Syria, but was instead part of the British mandate of Pales-

GROEBLE FROM BLACK STAR

*The terraced city of Amman, capital of Transjordan, is built on seven hills on the western edge of the Arabian Plateau.*

tine; and from the acceptance of an offer by Great Britain, later in that year, of the designation as ruler or emir to Abdullah ibn-Husein, son of King Husein of the Hejaz and brother of King Faisal of Iraq.

Jordan has an estimated area of 45,000 sq. mi. From north to south it is 235 mi. in length, and from east to west it is 250 mi, at the widest point and about 100 mi. at the narrowest. On the north the kingdom is bounded by Syria; on the east by Iraq and Saudi Arabia; on the south by Saudi Arabia and the Gulf of Aqaba (an arm of the Red Sea); and on the west by Israel. For administrative purposes Jordan is divided into several districts: Ajlun (ancient Gilead) in the north, east of the Jordan River; Belqa (ancient Amman), south of Ajlun and containing Jordan's capital, Amman; Kerak (ancient Moab), farther south; Ma'an (ancient Edom), the southermost region; the Desert Area (under the control of the Arab Legion), east of these districts; and Palestine (which was incorporated into Jordan in 1950), the area west of the Jordan River and the Dead Sea.

## GEOGRAPHICAL FEATURES

**Topography.** Jordan is an elevated plateau above the escarpment of the Jordan River and the Dead Sea and has an altitude varying from about 1,500 to 5,000 ft. Except for the western fourth of the country the land is extremely arid and consists of steppe and desert. The western area, which is roughly that west of the Hejaz Railway, has agricultural potentialities. During Roman times it was the most productive area, and with more and better irrigation it could become so again.

**Climate.** Western Jordan has, in general, a Mediterranean climate. The rains come from October to May, with rainless summers, although the prevailing westerly winds moderate the climate throughout the year. In the Jordan Valley the temperatures range from 50° to 105° F. On the plateau to the east the range is from 35° to 95° F., and in the eastern desert temperatures range according to the season from 32° to 105° F. Some places on the plateau receive as much as 30 in. of rainfall each year although the annual rainfall for the entire plateau area is from 14 to 16 in. This tapers off to the east until in the desert many areas receive about one inch per year. In the higher areas snow falls nearly every winter.

**Soil.** The soil is generally fertile, but the scarcity of water and the seasonal rainfall make agriculture very dependent upon irrigation. Thousands of acres could be opened to agriculture if all irrigation possibilities were developed.

**Minerals.** The greatest mineral resources of Jordan are contained in the waters of the Dead Sea, the salinity of which is about eight times that of ordinary sea water. It is estimated that the total quantity of the chief minerals in solution are: magnesium chloride, 22,000,000,000 tons; sodium chloride, 11,000,000,000 tons; calcium chloride, 6,000,000,000 tons; potassium chloride, 2,000,000,000 tons; and magnesium bromide, 980,000,000 tons. Other known or proven mineral deposits are not very great. In the Ajlun region there are iron ore deposits of about 200,000 tons, but transportation facilities are lacking. Small amounts of copper, magnesium, ochre, bitumen, and oil exist but hardly in workable quantities. Phosphates, gypsum, marble, and industrial sands and clays are not extensively utilized.

**Fauna.** Wild boars and ibex are found in the gorges, while south of the Dead Sea may be found the hare, jackal, fox, wildcat, hyena, wolf, and a few panthers. Wild fowl such as partridges and pigeons are plentiful. The desert and steppe regions to the east have little game although some gazelles are occasionally seen.

## ETHNOLOGY AND POPULATION

Almost the entire population of Jordan is Arab. Those now settled in villages and on farms are the descendants of nomadic Arabs who have drifted in from the eastern desert

throughout the course of history. The Arabic tongue is spoken, and Islam is the state religion.

There has never been an official census of Jordan, for the people rebel against an enumeration since the procedure is too similar to the registering for taxation and army service under the Ottoman government. Following the annexation of eastern Palestine, Jordan's population in November 1950 was estimated at 1,367,000, comprising 464,500 native Jordanese, 102,500 refugees east of the Jordan, and 800,000 inhabitants and refugees in West Jordan. Of these, 15,000 are Shiite Moslems and 30,000 Christians belonging to various rites, almost all of whom speak in the Arabic tongue. Oddly enough, there are several Bedouin tribes that subscribe to Christianity, but in many ways, even to the practice of polygamy, they are practically indistinguishable from the neighboring Moslem tribes.

The steppe and desert land of Jordan, except for a few instances, is uninhabited during the greater part of the year. The inhabited area, west of the Hejaz Railway, has a population density of about 100 per square mile. The population is divided roughly into four groups: 40,000 Bedouins; 120,000 seminomads; 500,000 refugees; and 700,000 townsmen and villagers. The chief towns and their estimated populations are Amman, 108,000; Old Jerusalem, 75,000; Irbid, 23,000; Es Salt, 15,500; and El Kerak, 5,500. In northern Belqa and in Ajlun the townsmen and settled villagers predominate, and the customs are those of the agriculturist. In southern Belqa and in Kerak the seminomadic element is more numerous, but under the security established by the Abdullah government the old tribal system is beginning to break down, Ma'an and the eastern desert region remain the realm of the Bedouin.

## GOVERNMENT AND POLITICS

**Central Government.** The Hashimite Kingdom of Jordan is ruled by King Husein. In accordance with the treaty with Great Britain establishing Transjordan's independence, constitutional government was adopted, and the newest constitution went into effect in 1952, having been approved by the legislative assembly and the king. The executive power is in the hands of the cabinet, which is responsible to the assembly and may be ousted by a two-thirds vote of that body. The assembly consists of two houses. The House of Notables, consisting of twenty-four members, is appointed by the king, and the House of Deputies of forty members consists of the cabinet members and representatives elected by all males who are nonnomadic and over eighteen years of age. The courts are presided over by judges appointed by the king, and jurisprudence is based on Moslem law. The chief *qadi,* or judge, is regarded as a member of the cabinet ex officio.

**Political Parties.** Political parties as such did not exist in the kingdom before 1950, when an opposition party was allowed to form. Local leaders and tribal sheiks have followers and political power, but they were never able to exercise any real independence during the strong rule of King Abdullah.

**Finances.** The finances of Jordan operate under peculiar circumstances. Large portions of usual government expenses for education, public health, and armed forces are financed by foreign, religious, and charitable institutions and by the British government. About five sixths of the cost of maintaining the Jordanian Frontier Force is met by funds from the treasury of Great Britain. In addition, Great Britain in various grants-in-aid contributes about 50 per cent of the total of the annual governmental budget. The most important tax in Jordan is the land tax; others are an animal tax, a house and land tax on urban property, an income tax, excise and stamp taxes, and custom duties.

The Jordan dinar is the monetary unit, and it is divided into 1,000 mils. The dinar is tied to and equivalent to the British pound sterling and was devalued in 1949 when the ratio of sterling to the dollar was changed. Gold coins of every mint are also in circulation although most of these are British sovereigns and Turkish gold pounds. Since the Arabs do not value copper coins, the smallest coin in circulation is the nickel five mils piece.

Jordan has no real public debt, having paid off its share of the old Ottoman debt in 1946. This debt actually was paid by a loan-in-aid received from Great Britain, but no one expects it ever to be repaid. In Jordan it has been looked upon as one of the many grants-in-aid made by the British each year. Such grants total between £2,000,000 and £3,000,000 annually in addition to special military grants, which often surpass that amount. However, grants for hydrographic surveys and for the construction of the Jordanian portion of the Haifa-Baghdad Highway are examples of other British contributions which have been made explicitly "to cover legitimate expenditure which the territory was unable to meet with its unaided resources." In addition, in 1952 Jordan received $3,780,000 under the United States Point Four program, to be spent on farming, health, sanitation, education, and transportation; and in 1954 is received $8,000,000 from the United States for economic aid.

**Armed Forces.** The trained armed forces of Jordan consist of the Jordanian Frontier Force and the more publicized Arab Legion. These are largely subsidized and equipped by the British and number more than 20,000. The Legion is empowered to act beyond the Jordan frontier, and it was this force which broke the Nazi-inspired *coup d'état* in Iraq in 1941. Its strength was never utilized at the time of the partition of Palestine.

## ECONOMIC ACTIVITIES

**Agriculture.** Agriculture, in general, follows the same methods used since the beginning of historic times, though various improvements in seed and irrigation projects have increased the total yield of the crops. Wheat, barley, and millet are the chief crops and since 1937 Jordan has had quite an exportable surplus. Beans, peas, and lentils are the main leguminous crops. The farmers along the Jordan River, however, have in recent years turned in part to the cultivation of vegetables such as tomatoes, cabbages, eggplant, cucumbers, potatoes, squashes, and melons. Jordan has long been a land that cultivated olives and grapes. As in Roman times, the grapes, raisins, and wine of Ajlun and Belqa are exported to Palestine and beyond the sea. Olives and olive oil are also exported. Tobacco, sesame, apricots, bananas, lemons, pomegranates, almonds, and figs are grown in smaller amounts and mainly for local consumption. The Bedouin and the seminomads raise sheep, goats, camels, horses, donkeys, and a few cattle. These are raised for food as meat and for work animals. Since 1930, however, the increased number of motor vehicles, especially trucks, has depressed the market for camels, and the Bedouin has been hard pressed financially.

**Mining.** The only significant mining in Jordan is that done by the Palestine Potash Company which holds a concession to exploit the minerals in the Dead Sea until the year 2005. The principal products have been potash and bromine, and in some years this Anglo-Jewish concern has extracted over 100,000 tons of various salts. In 1950 the

utput was low because of the heavy damage done to the nstallations during the Palestinian war.

**Industries.** Jordan has virtually no industries. Two obacco factories in Amman employ several hundred people nd produce solely for the local market. There are three rude distilleries, a small textile factory, and a few olive resses in the country, but in the main the requirements of ordan are still met by home industry and imports.

**Fisheries.** The Gulf of Aqaba abounds in edible fish, but very attempt to exploit this resources has failed. A good narket for fish exists in Israel and Jordan, but transport of he catch has never been organized and developed.

**Trade.** Jordan's export trade consists almost entirely of ivestock and agricultural products, delivered chiefly to raq, Israel, Syria, Saudi Arabia, and Egypt. Textiles are he chief import, and the prewar market, mainly Japanese, as been supplanted by Britain, Lebanon, and Syria. Commerce is handled primarily by individuals or by families in artnerships, and much of the trade is arranged through eighboring markets, such as Baghdad, Damascus, Beirut, Haifa, and Alexandria. Banking is in a primitive state. The Ottoman Bank of Paris is the government bank, and cts as a currency-issuing authority. Other banks engage in he transfer of funds and in foreign exchange.

**Communications.** Jordan is a member of the International Postal Union and mails are dispatched via Syria, Iraq, Israel, and Egypt. The principal towns are connected by elephone and telegraph, and extend to the neighboring countries. These facilities are largely used by the government and imited in service to the public. A number of all-weather roads have been constructed since 1936 when the British government began many grants-in-aid for this purpose. Roads east-west and north-south through Amman to the frontiers have been built and about 210 mi. of the modern Haifa-Baghdad Highway traverses Jordan, the chief town on this road being Irbid which is developing into a commercial center. The only railroad in Jordan runs from Nassib to Ma'an, a distance of 200 mi., and is part of the Hejaz Railway which operated only before World War I. It is little used and only one train each week operates over the Amman-Ma'an section. It incurs a considerable yearly deficit and probably never will be profitable until Jordan becomes more developed. The British Royal Air Force maintains landing fields at Amman and Ma'an, and the Iraq Petroleum Company has one at its pumping station in the eastern desert. A large air field, recently constructed at Mafraq in the north, at a cost of £2,500,000, has become one of the most important airports of the Near East. Two Jordan airlines serve Amman and Jerusalem, linking them with Beirut, Cairo, Aden, and Baghdad.

## EDUCATION AND SOCIAL CUSTOMS

**Education.** Half of the inhabitants of Jordan are illiterate. Every town and major village has a school, but applicants are turned away each year for lack of buildings and teachers. Education is free, but it is not compulsory. There are about 750 schools, with some 3,000 teachers and about 125,000 pupils. Advanced students are sent abroad.

**The Family.** In the villages and towns the important unit of society is the family, and all social life revolves around it. Among the seminomads and Bedouins, the tribe with a sheik at its head functions much as it did in early Biblical times, although the more the farmers become involved in agriculture the less they adhere to tribal organization. As this trend continues and various of the Bedouin tribes become settled, the old customs of the desert will disappear.

## HISTORY

The land east of Palestine, between the Jordan River and the barren deserts farther eastward, has experienced considerable prosperity in several historical periods. Known in Biblical times as Gilead and the kingdom of Moab, under Antoninus Pius as Arabia Petraea, and as an important province in Byzantine, Ommiad, and Abbassid times, Transjordan was one of the granaries of the world. After the conquest of that general area by the Ottoman Turks in 1516, Transjordan was relatively unimportant and became a part of the vilayet (province) of Syria.

SCOFIELD FROM EWING GALLOWAY

*A BEDOUIN FALCONER OF THE DESERT OF EASTERN TRANSJORDAN*

**Post-World War I.** Included in the unified Arab state which was promised to Grand Sheriff Husein ibn-Ali for his participation in the Arab revolt against the Turks during World War I, Transjordan became in 1920 a part of the Syrian state proclaimed from Damascus by a congress of Arab notables. Faisal, Husein's son, was chosen king. French armed forces, however, compelled Faisal to quit Syria, but the French never occupied Transjordan, leaving it to the British who merged it with Palestine. Sir Herbert Samuel, the first High Commissioner for Palestine, established in Transjordan local councils of Arab leaders who maintained order and an administration under the guidance of several British army officers. Late in 1920 Abdullah, another of Husein's sons appeared at Ma'an in southern Transjordan with an armed force, ostensibly on his way to Damascus to regain the city for his brother. Because Abdullah was cordially welcomed by the Arabs, Winston Churchill, then British Secretary of State for the Colonies, on his visit to Jerusalem in 1921, effected a compromise by recognizing Abdullah as Emir of Transjordan. The Emir agreed to accept advisers (Col. T. E. Lawrence was the first to hold this post) and a British subsidy for the maintenance of an Arab army. The Council of the League of Nations consented to this arrangement with the proviso that the articles in the Mandate of Palestine concerning the Jewish National Home were not to apply to Transjordan. In April 1923, Sir Herbert Samuel visited Amman and agreed to recognize the independence of the government whenever a constitution

SCOFIELD FROM EWING GALLOWAY

*The ruins of Gerasa of the Decapolis, a confederacy of ancient cities lying east of the Jordan which united in Roman times to form a customs union and to guard against invasion*

should be adopted that would respect the obligations to the British government. At that time Emir Abdullah organized his government around a self-appointed Council of Ministers. As the revenue of the government was inadequate to meet the expenses, Great Britain at first subsidized Abdullah to the extent of about £200,000 a year.

Transjordan was invaded from the east in 1922 and again in 1924 by the Wahabi Arabs. Serious fighting occurred, but in each case the British forces and Abdullah's Arab Legion, with the use of superior mechanized equipment, were able to rout the Wahabis. At that time a British air force camp was established at Amman and an air field at Ziza, south of Amman. In 1925, the Hadda Agreement defined the frontier to satisfy Abdullah and Ibn Saud, king of the Wahabis, and each agreed to punish perpetrators of raids into the other's territory. With peace insured, Transjordan was able to carry out a program of road improvement, water supply, and many long-needed developments. In 1931 the Hadda Agreement, which had also established a common frontier between Transjordan and Iraq, was supplemented by the Treaty of Friendship between these two states, and the long series of treaties which ended in the formation of the Arab League was begun.

Under High Commissioner Field Marshal Lord Plumer (1925-1928), the defense force in Transjordan was transformed into the Transjordan Frontier Force, which in turn became embodied in the British Imperial Army. In 1925-1926, while the risings in Syria were in process, the Frontier Force and an armored car contingent held the Transjordan frontier inviolable, although many Syrian exiles were admitted, appreciably increasing Transjordan's population. Under Lord Plumer, Transjordan experienced a period of economic development, internal security, fiscal reform, and general administrative co-ordination.

In Jerusalem, in February 1928, the British and Abdullah signed an Anglo-Transjordan treaty which, in effect, changed Transjordan from a mandate to a protectorate. Abdullah agreed that all communications with foreign powers would be directed through the British resident in Amman and that no foreigner would be appointed to any office without the approval of the British. Although the treaty stipulated that powers of legislation and administration were to be exercised by Abdullah through a constitutional government, the British High Commissioner was designated as Abdullah's guide in all matters with respect to finance, justice, foreign relations, tariffs, loans, construction and operation of railroads, budget, concessions for exploiting natural resources, and any law concerning matters governed by the mandate or the treaty. Furthermore, Abdullah consented to the maintenance of British armed forces in Transjordan and pledged his full co-operation with them.

Simultaneously with this treaty of 1928, Great Britain presented to Abdullah a constitution or organic statute for his issuance. Strong opposition arose among the people of Transjordan over this constitution and the treaty with Great Britain, but they were accepted in April 1929. The organic statute provides for an hereditary emirate in the family of Abdullah, to rule with the aid of an appointed Council of Ministers and an elected Legislative Council. All powers of the emir must be exercised through a written instruction or decree. The first Legislative Council was reluctant to pass any legislation, and Abdullah dissolved it when it refused to pass the budget. The principal governmental responsibility has been the maintenance of public security. For this task, the Arab Legion has been concerned with internal questions while the Frontier Force has defended the borderlands facing Syria, Iraq, and Saudi Arabia. Other functions of government have been the development of better motor roads to make all parts of the country more accessible, the establishment of an educational system, the introduction of vaccination, the founding of a hospital at Amman, and the improvement of agriculture. Many of the officials in the several departments of the government are Palestinians, Syrians, Lebanese, Iraqis, Egyptians, and Turks; Jordonian officialdom is a welter of nationality.

**World War II.** Upon the outbreak of World War II, the British took various precautionary measures to insure the position of Transjordan, and the Arab Legion and Frontier Force were strengthened and modernized. These forces played an extremely significant role in defeating the pro-Nazi attempted *coup* in Iraq in 1941, and in many ways the forces in Transjordan served as a shock force and as a steadying influence upon the entire Near East during World War II. Abdullah remained steadfast in his loyalty to Great Britain, perhaps in the hope of becoming the head of a larger or expanded Arab state.

**The Arab League.** In 1944 Transjordan was one of the signatories of the Alexandria Protocol which created the Arab League consisting of independent Arab states bound together to preserve Arab countries, including Palestine, for the Arabs. Although Abdullah visited Syria and Turkey in the interests of the Arab League, at times he wavered in his opposition to the Zionists and the partition of Palestine. He sold land in Transjordan to Zionist groups and unquestionably hoped to annex the Arab parts of a divided Palestine to Transjordan. In 1946 Abdullah negotiated another Anglo-Transjordan Treaty, grainting him greater independence and obtaining British recognition of his position as King of Hashimite Transjordan.

The treaty was revised in March 1948, making Transjordan a military ally of Great Britain and extending an annual British military subsidy of about £1,600,000. As a result, the Transjordan government obtained a stronger voice in the determination of facilities to be granted British forces

on Transjordan soil. On Oct. 20, 1947, the first elections for members to a House of Delegates, twenty in number, previously appointed by Abdullah, were held. Ten sheiks, appointed as before by the king, formed the House of Notables.

Transjordan was an important member of the Arab League, and King Abdullah, at first, pursued a policy in harmony with the general policy of the League. He backed its policy against the partition of Palestine, which he considered the most important concern of the whole area. In the meantime, Abdullah urged his plan for unifying Transjordan, Lebanon, Syria, and Palestine into a Greater Syria. This plan, together with the failure of Transjordan's famed Arab Legion to pursue an aggressive military role in the civil war in Palestine, antagonized all of the other Arab League governments. In December 1948 Abdullah was proclaimed King of all Palestine, Parliament approved the merger of Transjordan with Arab Palestine, the name of the new state became the Hashimite Kingdom of Jordan, and Abdullah appointed a new Mufti of Jerusalem.

Most of the other Arab states did not accept Abdullah's unilateral action and recognized the Arab government for Palestine in Gaza. Great Britain, however, continued its friendly relations and increased the financial aid to Abdullah. 1950 elections were held for a new Parliament, and a new House of Notables was appointed. The new Parliament approved of the formation of the Hashimite Kingdom of Jordan, and Abdullah notified the United Nations of the annexation. This action intensified the resentment of the dissident Arab elements, and on July 20, 1951, Abdullah was assassinated in Jerusalem by a supporter of the exiled Mufti who opposed the annexation of Arab Palestine. Abdullah was succeeded by his son Talal, who was in Switzerland suffering from a nervous disorder. In August 1952 Parliament removed Talal because of continuing ill health and proclaimed his son Husein as king.

Jordan has attempted to carry out a rather difficult and seemingly contradictory foreign policy. In 1951 it signed friendship pacts with Syria and Lebanon, and in 1952 it became a signatory of the defense pact of the Arab League. Its abandonment in 1952, under King Talal, of Abdullah's Greater Syria project improved relations with its Arab neighbors. In 1953-1954 border clashes with Israel threatened a renewal of the Israeli-Arab War, and in view of this, Jordan requested and received promises of military support from the Arab states. But at the same time it was sympathetic to the Western powers, possibly due to British influence, and expressed an interest in the Turkey-Iraq agreement. In 1955 Jordan was invited to join the Mid-East Defense Pact, sponsored by Turkey and Iraq (and later joined by Iran) but opposed by other Arab League members, Egypt and Saudi Arabia.

**TRANSLOCATION IN PLANTS.** *See* PLANTS, TRANSLOCATION IN.

**TRANSMIGRATION.** *See* METEMPSYCHOSIS.

**TRANSMISSION LINES, ELECTRIC,** either wires strung on poles or towers, or underground cables. On the overhead transmission lines, the principal insulation is the atmosphere, supplemented by porcelain insulators to support the wires from the pole or towers. Because of the low dielectric strength of air, wires of opposite phase must be several feet apart. The conductors of opposite phase in underground cables, on the other hand, have to be very close together, necessitating the use of insulating material of the highest electric strength. The most suitable material for this purpose has been found to be kraft paper impregnated with mineral oil. Underground cables of this type are in operation for voltages as high as those for any aerial transmission line, namely, 230,000 volts. Serious problems arise in connection with the termination of underground cables because their ends are necessarily in air and require the wide separation characteristic of aerial lines. In order to bring the impregnated-paper-insulated conductors of an underground cable from their close proximity to the separation they require in air, elaborate terminal devices have to be installed. A similar problem exists where the widely separated conductors of an aerial line are brought into the confined space of a transformer. The difficulty of design of suitable terminals and the limitations imposed by corona, described at the end of this article, are the principal obstacles which have to be overcome as transmission lines are built for higher and higher voltages.

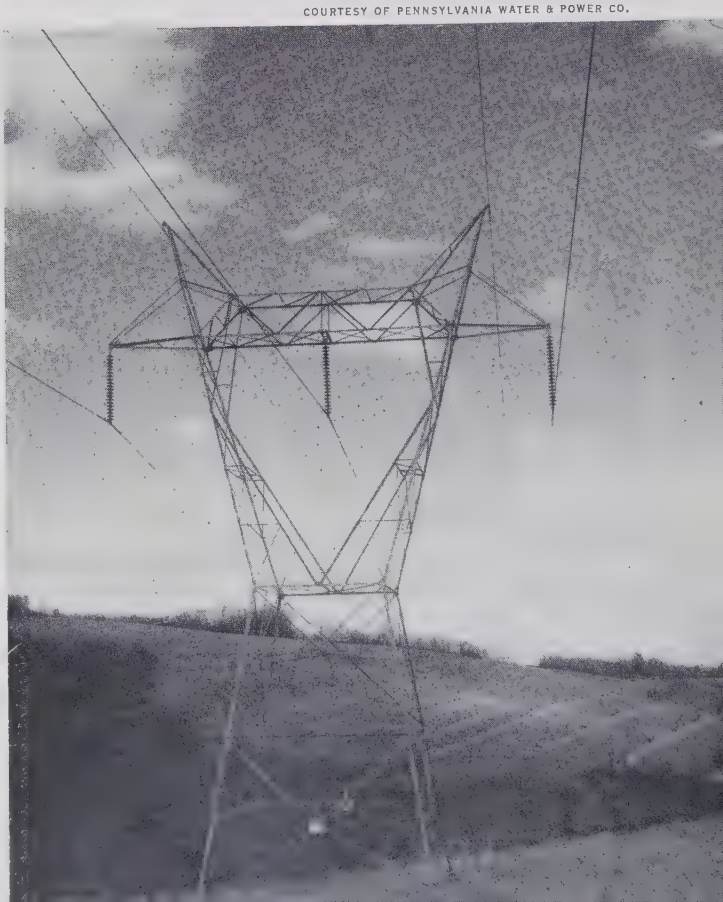
### POLE AND TOWER LINES

Pole and tower lines are used in electrical transmission and distribution as supports for conductor-carrying insulators.

**Poles.** Poles, usually of wood, are used for urban and suburban distribution, with an average spacing of about 125 ft. Since the disappearance of chestnut, the woods most favored are northern white cedar, western red cedar, creosoted pine, and wallaba. The crossarms, however, are more generally made of Dougas fir. Poles are set in soil to a depth varying from 5 ft. for a 20-ft. pole to 9 ft. for an 80-ft. pole, or about two-thirds these amounts if set in rock. Poles are guyed with galvanized steel wire where there is tendency for excessive bending, as at curves and ends of the line. Insulators are placed in the guy lines as a safety precaution. Crossarms are attached by one or two steel bolts after "gaining" the pole, i.e. cutting a flat surface against which the crossarm fits. Braces applied diagonally are used where the

*Typical tower and electric transmission lines carrying 220,000 volts*

COURTESY OF PENNSYLVANIA WATER & POWER CO.



load is heavy. The top surface of a crossarm is curved to shed rain. All hardware is of hot-dip galvanized steel.

**Towers.** Towers are made of structural steel, mostly angles, the four legs being either set in concrete foundations or bolted to structural-steel foundations. The spread (area) of a tower is usually about 20 to 25 per cent of its height. Flexible two-leg towers are also in limited use. Crossarms of towers are of steel, integral with the main structure.

**Insulators.** There are two types of insulators. One type is supported on the crossarm on either wood or steel pins, wood being used only up to 7,500 volts. Wooden pins fit in holes in the crossarms and are nailed in place. Steel pins have a threaded shank which passes through a hole in the cross-arm, and they are fastened by a nut and lock washer underneath. Such insulators are used up to about 25,000 volts. Above this voltage, another type of insulator, known as the disk or suspension type, is used, consisting of a series of disks, usually of porcelain. These hang below the crossarm and are connected together by hardware which gives flexibility to the string and is so attached to the disks as to put the porcelain in compression.

**Cables.** The cables used on pole and tower lines are generally either of bare copper or bare aluminum with a steel core. Cables hang in a catenary curve which is so nearly a parabola that design calculations are usually based on the simpler equations of a parabola. These equations give the relation between span, sag, tension, weight of cable, temperature, and weight of ice and wind loads.

**Zones and Hazards.** The National Electric Safety Code divides the United States into three ice and wind zones for purposes of aerial line design.

Overhead lines are subject to vibration, revealed by humming, which is likely to cause breakage of the wire at, or near, the insulators. Vibration may be stopped by means of a Stockbridge damper, a dumbbell-shaped metal weight attached to the cable at the center of its waist. When coated with ice, overhead lines are also subject to "dancing," an irregular motion of considerable amplitude, if there is gusty wind. Such dancing has been known to wreck a line completely, and there is no known way to stop it except by melting off the ice. Lightning protection is afforded by arresters and choke coils at the stations, by arresters at intervals along the line, or, in the case of the higher voltages, by one or more grounded cables carried at the top of the towers, above the transmission cables.

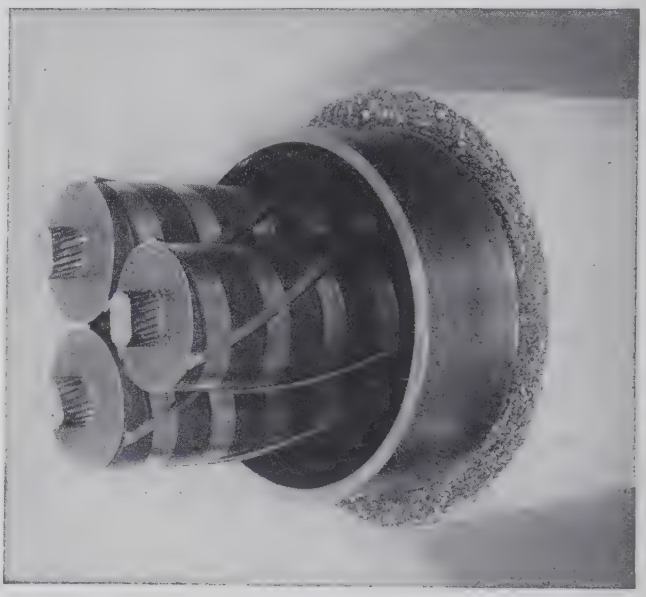
## HIGH-VOLTAGE CABLES

Practically all high-voltage cables are used for three-phase circuits and therefore are either three-conductor cables or single-conductor cables used in groups of three.

For voltages of about 15,000, rubber insulation is used only for such special purposes as submarine cables, and a few aerial distribution lines. Varnished-cambric insulation is used for high voltages to a limited extent, principally for station cables and in places where there are tall vertical runs. Such cables are insulated with helically-applied tapes of varnished cambric with a "slipper" of oil or grease between layers.

**"Solid" Impregnated-paper Cables.** Impregnated paper in several forms is almost universally used for important high-voltage cables for several reasons, among which are economy, higher dielectric strength, lower energy loss in the dielectric, and excellence of service record. The basic element of a paper-insulated cable is a stranded copper conductor covered with strips of oil-impregnated kraft paper, about ¾ in. wide and about 0.006 in. thick. The paper is laid helically with about 1/32 in. between turns, successive layers being staggered about one-third the tape width and the number of tapes depending on the voltage. In a single-conductor cable, this basic element is enclosed in a lead sheath. In a multiple-conductor cable, a group of such "singles" is laid up helically, and the group, usually rounded out with crepe-paper fillers, is enclosed in a lead sheath.

For three-conductor cables up to about 10,000 volts it is usual to place a belt of paper insulation over the group of singles and fillers. Formerly, this construction was used up to about 33,000 volts but was abandoned in the higher ranges



COURTESY OF PHELPS DODGE COPPER PRODUCTS CO.

*Three-phase, 138,000-volt, compression cable system. Steel pipe contains oil or nitrogen under a pressure of 200 lb. per sq. in. The cable is insulated with oil-impregnated paper, sheathed with polyethylene, and armored with bronze tape. The segmental wires over the bronze tape are "skid wires" to facilitate installation.*

because of a destructive phenomenon due to the nonuniformity of the voltage at the surface of the singles around the circumference. This condition gives rise to tangential stresses, that is, electrical stresses along the surface film of oil on the paper. Since the oil has only a small fraction of the dielectric strength of the impregnated paper, it chars, with resultant serious damage to the cable.

**Shielding.** Tangential stresses were overcome by the device of shielding. First introduced in Germany by Martin Hochstadter about 1913, shielding consisted in enclosing each insulated conductor in a shield composed either of metal or metallized paper, whereby the voltages all around the circumference of the insulation were equalized. Shielding also had the effect of preventing ionization of any voids that might exist between the insulation and sheath. Such voids were liable to occur because the expansion of the oil under load would stretch the sheath beyond its inherent elastic limit, leaving spaces as the oil contracts with decreasing load. In the United States, this system came into general use in the 1920's. Shielding has become standard practice on all three-conductor cables for over 15,000 volts; many utilities place the limit at about 10,000 volts.

The success of external shielding prompted inventors, notably C. Beaver in England and M. Weiset in Germany, to use internal shielding, i.e., shielding over the conductors. This may take the form either of paper coated with aluminum or paper containing sufficient carbon black to make it

semiconducting. In either case, both the 60-cycle and impulse dielectric strength are somewhat augmented. Shielding did not entirely eliminate ionization of voids, and as transmission voltages increased it became necessary to have cables without ionizable voids.

Cables so far discussed have been of the type known as "solid" because the insulation is handled as if it were a solid like rubber. During manufacture, such cables are dried and impregnated with viscous mineral oil, sometimes holding rosin in solution, just before the application of the lead sheath. Solid cables are made in lengths averaging about 400 ft. and are shipped on wooden reels. In American practice, they are installed in ducts, the ends terminating in manholes, where joints are made between successive lengths. European and South American cables are generally armored with steel tape and are buried directly in the ground or in concrete troughs. The joints between successive lengths are also buried.

**Fluid-filled Cable System.** J. F. Watson of England proposed in 1914 to use a thin (low-viscosity) oil which would move with comparative freedom through the paper insulation and quite freely through special tubular channels built into the cable and connected to reservoirs at the joints. By this means, expansion and contraction of the oil would be directed into and out of the reservoirs without stretching of the lead sheath or forming voids. It remained, however, for L. Emanueli of Italy to develop this idea into a practical combined electrical and hydraulic system, known as the fluid-filled or oil-filled cable system. In this, the oil channel consists of a tube of helically laid steel or bronze strip. In single-conductor cables, the strip is located inside the conductor; in three-conductor cables, in each of the three spaces ordinarily occupied by fillers. This system has had an enviable record of success on a large scale, especially for voltages from 33,000 to 138,000. One line in Paris, France, operates at 230,000 volts. The line of cable has to be designed on a hydraulic basis to balance or limit the internal pressure on grades and with respect to the flow of oil in and out of the reservoirs, through the long, narrow oil ducts. To facilitate this balancing, stop joints are used at intervals along the line and reservoirs are installed at each such joint, thus limiting the distance that the expanding and contracting oil has to travel. These reservoirs are tanks containing multiple pressure-responsive metal cells which hold either the oil, itself, or nitrogen gas under pressure, in which case the oil is in the tank external to the cells. Where it is not possible to balance pressures by gravity, nitrogen gas pressure in the tank may be substituted.

**Pressure Cables.** In the middle 1920's, H. W. Fisher and R. W. Atkinson conceived the idea of putting cable insulation under gas pressure so as to eliminate voids. The system was never implemented in any practical form. The idea, however, was taken up by Martin Hochstadter and W. Vogel of Germany soon after the appearance of Emanueli's fluid-filled cable system. Whereas in the Emanueli system it is customary to install the cables in ducts, these inventors developed a system known as the compression cable system, wherein the cable is of the solid type with a lead sheath but is contained in a steel pipe under a gas pressure of some 200 lb. per square inch. Such a pressure squeezes the lead sheath against the insulation and develops a substantially-equal pressure inside the cable so that void formation and ionization are effectively prevented.

In all the numerous European installations of the compression cable, and in the first American installation in Detroit, the cables have lead sheaths and the pressure medium in the pipe is nitrogen gas, pressure being applied from high-pressure gas cylinders, through reducing valves, at the ends of the line. Later American installations have a sheath of polyethylene reinforced with bronze tapes instead of the lead sheath, and sometimes oil is used as the pressure medium. In such cases, pressure is applied by means of small pumps at the ends of the line, and the expansion and contraction of the oil are taken up by terminal tanks.

In American practice the pipe is seamless steel, with welded joints every 40 ft. and corrosion protection of the highest quality. Some installations have been made in England wherein the cable has a double sheath with a gas pressure space between them, the outer sheath being heavily reinforced with metal tapes to withstand the gas pressure.

**Oilostatic Cable.** In the early 1930's Hugo Sonnenfeld of Czechoslovakia and C. E. Bennett at Hawthorne, N. J., independently developed a form of pipe pressure cable differing from Hochstadter's in having no permanent cable sheaths. The cable, which is of the solid type, is made with a sheath provided with a rip-wire by means of which it is removed as the cables are drawn into the pipe. The oil pressure is maintained, and the oil expansion and contraction are provided for by terminal pumps and reservoirs. Several successful lines of this Oilostatic system are in operation at voltages up to 132,000, one of the most notable being that of the Pennsylvania Railroad at Baltimore.

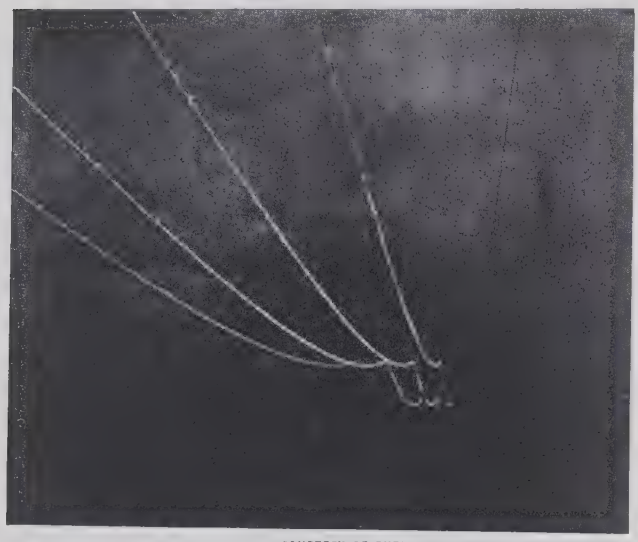
**Low- and Medium-pressure Gas-filled Cable.** An ingenious type of cable for voltages up to about 46,000, developed by G. B. Shanklin, came into use in 1938. In the past, every effort had been toward preventing the formation of voids in paper cables, whereas this inventor deliberately drained as much oil as possible and replaced it with nitrogen gas. The cable is kept under a pressure of 15 to 20 lb. per square inch from tanks at the terminals, using channels, similar to those in fluid-filled cables, as a means for applying the pressure to the insulation. In a three-conductor cable, two of these channels are made of helical bronze tape and therefore allow the gas access to the insulation along their entire length. The third gas channel is a solid copper pipe, open only at the joints, serving to by-pass any obstructions in the other channels which might be caused by oil slugs. Single-conductor cables have gas ducts in or under the sheath for local gas pressure, and usually use an external pipe, connected into the joints, to carry the gas pressure past local obstructions. The moderate pressures used in these cables is not great enough to bulge the sheath. Cables of similar type have been developed for gas pressures of 40 lb. per square inch. In these, an extra-thick sheath or one with suitable reinforcement is used.

Cables with minimum excess oil but no sheath, placed in steel pipe with nitrogen gas under pressure, are in use in England and there is one installation in Detroit, where it is known as the S.M.D. system. The latest development in pressure cables is the Hydrolene system, invented by K. S. Wyatt, in which the cable is insulated with polyethylene, the pressure medium is water, the pressure is 50 to 100 lb. per square inch, and the pipe is normally of asbestos cement. It is important that in these various pressure systems, all the conductors of a circuit, usually three, be placed in one pipe to avoid having magnetic material between phases, thus preventing the formation of eddy currents and consequent loss of power.

## CORONA

Corona is a luminous glow which appears on an electrical conductor when the electric stress near its surface becomes greater than the dielectric strength of the surrounding air. This phenomenon, unless proper precautions are taken, may

occur on high-voltage transmission lines, giving rise to considerable loss of energy and radio interference. Corona is explained by the ejection of ionized (charged) particles from the high-voltage conductor and their collision with molecules of the gases composing the surrounding air. Such collisions ionize the gas molecules and lead to the formation of more ionized particles, the action extending outward until a distance is reached at which the electric-field strength is insufficient to support it. Ionization by collision cannot occur unless



COURTESY OF PHELPS DODGE COPPER PRODUCTS CO.

*The phenomenon of "corona" on an electric power line*

the ionizing particles are moving at a sufficient velocity to detach ions, i.e., charged particles, from the molecules of air. Therefore, the dielectric strength of air is critical not at the surface of the wire but at a distance sufficient to allow the ejected ions to accelerate to the requisite velocity. It is usual to design transmission lines to operate without corona, using formulas originated by F. W. Peek and modified by others. However, on lines far from inhabited communities, it may be permissible to operate with mild corona, both as an economic measure, where the incremental cost of power is low, and to serve as an aviation warning. Corona may be eliminated or reduced by making the conductor diameter great enough to keep the electric stress below the ionization point of air.

The voltage at which corona appears depends on a number of factors: (1) whether the wire is solid or stranded—corona is higher with solid than with stranded conductors; (2) the number of wires in the outer layer of a stranded cable (the outer layer usually has 6 or 12 wires)—the smaller the number of wires, the higher the corona; (3) the spacing of conductors—the greater the spacing, the higher the corona; (4) the smoothness of the surface—the smoother the surface, the higher the corona; (5) the presence of grease on the wires—the less the amount of grease, the higher the corona; (6) the barometric pressure—the greater the pressure, the higher the corona; and (7) the temperature—the lower the temperature, the higher the corona.

Conductors of ordinary stranded construction, used for very high voltages, would require a greater amount of metal than needed to carry the current if they were to have the requisite diameter for corona suppression. It is economical, therefore, to use conductors of special design, such as the following: (1) the A.C.S.R. type, consisting of aluminum wires stranded over a steel cable; (2) the H.H. or Hedderheimer type, consisting of a tube of interlocked strips of copper; (3) the P.D.C.P. type, consisting of one or more layers of copper wires stranded over a group of hollow copper tubes; or (4) the I-beam type, consisting of one or more layers of copper wires laid helically over a twisted copper I-beam. *See also* ELECTRIC-POWER TRANSMISSION; VESSELS, INLAND. **TRANSPOSING INSTRUMENT,** a musical instrument that produces notes of a different pitch from those written for it. A large number of the wind instruments, in particular the clarinets, trumpets, horns, and saxophones, are of this type. Originally these instruments were constructed in a variety of sizes, to produce various key and pitch ranges. To obviate the need for the player to learn new fingerings or positions for each real sound to be produced, the convention developed that the fundamental tone would be designated as "C," whatever the actual pitch of the instrument might be. Thus the note "C," if played on a trumpet in B♭, produces the sound of B♭, and each note played on such a trumpet sounds correspondingly one tone lower. On the same principle, the "C" of a horn in F actually sounds as F, with all real sounds a fifth lower than those written. The string bass and contra bassoon are transposing instruments whose notes sound one octave lower than written, while the piccolo in C sounds notes an octave higher. In these cases the transposition is made to eliminate the excessive and confusing use of ledger lines in the written parts. *See also* CLARINET; HORN; SAXOPHONE; TRUMPET. R. F. G.

**TRANSPOSITION,** in music, the rewriting or extemporaneous performance of a passage in another key, and thus another pitch, than that in which it originally appears. Rewritten transposition is often necessitated by the inability of singers to reach the extreme notes of a song or aria, while transposition "at sight" is a common necessity among modern orchestral players confronted with parts written for an instrument pitched differently from their own; many clarinetists, for example, play parts for the obsolete C clarinet on a B-flat instrument, thus mentally transposing every note a tone higher. *See* TRANSPOSING INSTRUMENT. W. Li.

**TRANSUBSTANTIATION,** the technical term employed by the Roman Catholic Church to express the total substantial conversion of bread and wine into the body and blood of Christ in the celebration of the Holy Eucharist. A conversion is a change of one thing into another in some aspect of being, and implies two positive extremes. A change is substantial when one substance becomes another, and if this conversion affects the whole substance and results in the transition of the entire substance of one thing into the substance of another thing, it is said to be total. Hence the doctrine of transubstantiation comprises three distinct propositions: 1) that though the accidents of bread and wine continue, their respective substances no longer exist; 2) that Christ is really present under the appearances of bread and wine; 3) that these two doctrines result from the total conversion of the bread and wine into the body and blood of Christ. Such change is without parallel in nature, and is

appropriately named since transubstantiation accurately describes this unique conversion. Thus excluding consubstantiation, which means that in the Holy Eucharist bread and wine persist and that the body and blood of Christ coexist in and with the natural elements, and excluding impanation, which proposes a personal union between bread and wine and the God-Man, transubstantiation represents precisely the Catholic teaching, and furnishes Catholics with a sure criterion for discerning errors relative to the Holy Eucharist. It is the teaching of the Church that this total conversion is clearly set forth in Christ's words: "this is my body;" "this is my blood." When He who is All Truth and All Power said these words, through their utterance the bread became the body of Christ and the wine became His blood. And to the priests of His Church He gave the power to do as He had done. D. J. M. C.

**TRANSVAAL** [transvɑ'l], an inland province in the northeastern part of the Union of South Africa. It is bounded on the north by Southern Rhodesia, on the east by Mozambique and Swaziland, on the south by Natal and the Orange Free State, and on the west by the Cape of Good Hope and Bechuanaland. The Limpopo River forms the northern boundary, and the Vaal and Pondola the southern. The area of the Transvaal is 110,450 sq. mi.

**Geographical Features.** In the southern part of the Transvaal are the treeless plains and rolling grass country of the High Veld, most of which is about 5,000 ft. above sea level. The eastern section of the High Veld is traversed by the Drakensberg Mountains, whose ragged outliers extend northward almost to the Limpopo. To the east of these ranges the land falls away to less than 1,000 ft. along the Mozambique border. To the north of the High Veld is the Bush Veld. Here both altitude and precipitation decline toward the north. The Transvaal as a whole is within the region of summer rainfall, more than 85 per cent of the precipitation coming between October and March. Rainfall exceeds 50 in. annually in the Drakensbergs and is below 15 in. in the far north. Throughout most of the High Veld it is between 25 and 35 in., decreasing toward the west and north. At Johannesburg (5,735 ft. above sea level) the average annual rainfall is 29.47 in.; the annual maximum temperature is 70.7° F., and the minimum is 47.9° F. Much of the province's precipitation is in sudden thunderstorms, and much of it is lost in runoff. Although there is much heavy scrub country, there are only a few small forested areas. With the advance of settlement, wild life has become scarce except in game reserves, notably the Kruger National Park (area about 8,000 sq. mi.) located between the Drakensbergs and Mozambique.

**Population.** The Transvaal had a 1951 population of 4,801,708, thus making it the most populous of the Union's four provinces. Population by groups was as follows: native Africans, 3,472,640; Europeans, 1,205,458; colored or mixed, 75,415; and Asians, 48,195. The majority of Europeans live within a radius of about 40 mi. of the industrial and mining center of Johannesburg, which in 1951 had a total population of 629,847, of whom about half were Europeans. Johannesburg is the largest city in southern Africa. Pretoria, capital of the province and administrative capital of the Union, had 230,243 inhabitants in 1951. Other important cities are Germiston (114,215) and Krugersdorp (74,960), both within 20 mi. of Johannesburg.

**Government.** The government of the Transvaal is derived from the South Africa Act (1909) and subsequent amendments to it. According to the Senate Act of 1955, the Transvaal is represented in the Senate of the Union by 27 seats. The Transvaal's representation in the Union's 159-member House of Assembly is based on population. At the 1953 election Transvaal obtained 68 Assembly seats. Under the Union's Bantu Authorities Act of 1951, the Transvaal African population is largely administered through tribal, regional, and territorial structures, established in accordance with traditional institutions.

*SWIRLING WATERS OF THE NELS RIVER NEAR NELSPRUIT STATION IN EASTERN TRANSVAAL*

COURTESY OF THE UNION OF SOUTH AFRICA GOVERNMENT INFORMATION OFFICE

As in the other provinces, the Transvaal's executive branch has an administrator appointed by the governor-general in council, and a provisional council, elected for five years, which has an executive committee of four. There are 66 members in the provincial council, and their governmental authority extends to local matters. Ordinances passed by the provincial council are, however, subject to veto by the governor general in council.

**Economic Activities.** Industry, mining, and agriculture (including pastoral pursuits) in that order are the basis of

the Transvaal's economy. The rapidly developing industry of the province ranges from the manufacture of iron and steel at Pretoria and Vereeniging to the small plants for processing agricultural produce located in other cities. There are engineering factories of various kinds, brass foundries, chemical plants, grain mills, breweries, brick and tile works, potteries, auto-assembly plants, and other industrial establishments. About half of the world's supply of gold comes from the Transvaal's fabulous mines on the Witwatersrand on either side of Johannesburg. The province's 1953 gold production of 11,940,616 fine oz., most of it coming from the Rand, was valued at £147,564,998. Uranium mining is now associated with South Africa's gold-mining operations, and many of the Rand's mines have installed uranium recovery plants. The largest known white diamond—the Cullinan—was found just east of Pretoria in 1905. The province's 1953 diamond output was valued at £13,992,729. Other important mineral products are coal, copper, tin, iron, asbestos, limestone, chrome ore, nickel, lead, silver, and the platinum metals.

Only a small proportion of the 55.5 million acres suitable for farming is cultivated. Chief products are sorghum, maize, oats, wheat, tobacco, vegetables, and citrus fruits. Much of the fruit and about half of the tobacco are exported. Cattle and sheep are the most valuable livestock, with meat, wool, hides and skins the chief animal exports.

**Transportation.** The Transvaal has 3,399 mi. of railway owned and operated by the Union. Main lines cross the province from north to south and from east to west, and there is a network of branch lines limited largely to the High Veld country of the south. The Union of South Africa Railways also operates an extensive motor road service. Johannesburg is the Union's air transport center, both local and international, and the terminus of British, South African, Swiss, Dutch, and Belgian lines to Europe and of Pan American World Airways to New York.

**Education.** Education is compulsory for European children, and 92 per cent of them attend government schools. As the result of the Bantu Education Act, education of the Transvaal's African population comes under the jurisdiction of the Union's central government, a system that supplants a previous network of state-aided missionary and church schools. The province had 1,488 Bantu schools in 1954. There is a third school system for both colored and Asiatic children and some schools for Indian children only. Government support for non-European schools substantially increased during the 1940's. The University of Pretoria is for Europeans only, while the University of Witwatersrand admits non-Europeans. Potchefstroom University College is a branch of the University of South Africa.

**History.** Before the early nineteenth century the Transvaal was inhabited mainly by the Bantu natives. Then the Zulus (Matabele) invaded and conquered large parts of the territory. In 1829 Robert Moffat, famous missionary of Bechuanaland, visited the Transvaal, and British explorers and traders soon followed. After the Great Trek of the Boers (1835-1840) Dutch settlements were made despite battles between the Boers and Bantu natives. The Boers declared the Transvaal independent, and many who disliked the British rule found a refuge there.

By the terms of the Sand River Convention of 1852, Great Britain acknowledged the independence of the Transvaal. In 1855 the town of Pretoria was founded. Marthinus Pretorius, first president of the South African Republic, as the Transvaal was called, wished the Orange Free State to join with the Transvaal to form a great Dutch-speaking republic. The Orange Free State declined and was not persuaded even when Pretorius and Paul (Oom Paul) Kruger led a raid to force the union of the two states.

The new South African Republic was soon divided by political rivalries and religious controversies. The machinery of government was almost paralyzed, and the economically weak state was nearly bankrupt. In 1877 Sir Theophilus Shepstone, British South African secretary for native affairs, annexed the Transvaal. The Boers proclaimed a republic again in 1880, went to war with the British, and obtained self-rule in 1881 under British sovereignty. The Transvaal then sought to expand, especially toward Swaziland, Zululand, and the coast; but the British and the natives resisted Boer encroachment. When gold was discovered in 1886 thousands of Uitlanders (foreigners) entered the Transvaal, particularly in the Witwatersrand area. The Boers took drastic measures to maintain their supremacy, and under Kruger continued a policy that was partly responsible for the Boer War (1899-1902). Four years after the end of the war the British government granted the colony self-government. In 1910 the Transvaal joined Cape Colony, the Orange Free State, and Natal to form the Union of South Africa, and the first prime minister of the new union was General Louis Botha, who had been premier of the Transvaal since 1907. Together, he and Jan Christian Smuts, also from the Transvaal, guided the affairs of the new Union for the next decade. W. M. W., G. S., and W. W. W.

**TRANSYLVANIA COLLEGE,** an accredited, coeducational, privately controlled college of arts and sciences, located in Lexington, Ky. It is under the auspices of the Disciples of Christ Church. The institution was chartered in 1780 and first instruction was offered in 1785. It was named Transylvania Seminary in 1783. In 1798 the name was changed to Transylvania University. After many changes in name and mergers with other educational organizations, the institution became known in 1915 as Transylvania College, although the legal name continues to be Transylvania University.

The only degree offered is the A.B. Pre-law, pre-medical, teacher, and business administration courses are given. Students not living at home must live in the college residences. Scholarship aid of small stipends is offered and there is a fund for loans. Some tuition scholarships are administered specifically for foreign students. Opportunities for self-help enable some students to earn part of their expenses. *For statistics see* COLLEGES AND UNIVERSITIES.

J. R. To.

**TRANSYLVANIAN ALPS,** a mountain range in Romania, crossing the country in an east-west direction. Actually the southern part of the great Carpathian arc, the Transylvanian Alps are so-called because they are reminiscent of the Swiss Alps in both appearance and development. Formed in Tertiary times, they are composed of a great crystalline core of gneiss, granite, and schist, with small zones of sedimentary rock on its flanks. Although cirques point to former glaciation, none of the present peaks are snow-capped permanently. The highest elevation is attained by Mt. Negoi, 8,347 ft. above sea level. Many low passes, some occupied by tributaries of the Danube River, allow easy railroad communication between the Danube Plain, south of the Alps, and the Transylvanian Basin, which is framed by the Alps and the Carpathians. D. L.

**TRAP,** a field and commercial term for any dark, fine-grained, igneous rock. The usual species included under this

name are basalt, diabase, and andesite. In trade parlance the coarser-grained gabbro and diorite may also be marketed as trap. The quarrying and crushing of trap is a fifteen to twenty million dollar industry annually in the United States. Leading states in trap production are Connecticut, New Jersey, Oregon, and Washington, with California, Colorado, New York, and Pennsylvania falling in the second group. Trap is used principally in concrete and road metal; other uses are as railroad ballast and riprap. K. K. L.

**TRAPANI** [trɑpɑ′ni], a province and also the capital city of the province, at the western extremity of Sicily. Trapani apparently took its name from the Greek word for sickle, *drepanon,* which the curving peninsula on which the city stands resembles.

**The City.** Trapani, 47 mi. west of Palermo, at 38° 1′ N. lat. and 12° 29′ E. long., is situated on a tongue of land which extends westward from the mainland for over two miles, terminating in several small islands and shoals. On the mainland, to the northeast, rises the massive height of Monte San Giuliano, which was famous in antiquity as Mount Eryx. To the south stretches a wide and fertile coastal plain. The important port of Trapani is on the southern side of the peninsula. Historically it was the port of departure for nearby Africa, and later was the entrepôt for traffic with the Egadi and other islands. Trapani is the terminus of two railway lines from Palermo. Salt, produced locally, is exported in large quantities, along with wine, fish, and prepared cereals. Enclosed within a wall, Trapani has been the scene of much conflict because of its strategic location at the tip of Sicily and at the narrowest point in the Mediterranean. In Carthaginian possession at the outbreak of the First Punic War, it fell under Roman rule in 241 B.C. The decline of Rome brought in the Vandals, who first touched Sicilian soil at Trapani. After a period of Byzantine rule, Trapani was conquered by the Arabs in the ninth century, who in turn were followed by the Normans in the eleventh century. In June 1266 a hard-fought naval battle took place off Trapani between Genoese and Venetian forces, with the latter triumphant. Pop. (off. est. 1947), 73,062 (including suburbs).

**The Province.** The province of Trapani comprises 20 communes, with an area of 965 sq. mi. In general, elevations are low, broken occasionally by peaks over 2,500 ft. Most of the population is engaged in agriculture, chiefly cereals, fruits, and wine. The principal industries are salt and wine production. The city of Marsala is noted for its own brand of fortified wine. Other important cities in the province are Alcamo, Castelvetrano, Erice, Mazara del Vallo, and Castellammare del Golfo. Pantelleria and the Egadi Islands belong to the province. Pop. (off. est. 1947), 412,000. R. G. W.

**TRAPASSI, PIETRO.** *See* METASTASIO.

**TRAP-DOOR SPIDER,** a common name given to various burrowing spiders, related to the tarantulas, that fit the top of their burrows with a hinged lid. These spiders live mostly in the warmer parts of the United States. They are much more abundant than is generally known, because of their nocturnal habits and well-concealed burrows. When disturbed, the spider holds the lid shut with surprising strength. The best known species are *Pachylomerides audouinii,* a 1⅓ in. spider, of the southeastern states and *Bothriocyrtum californicum,* a 1-in. spider, of southern California. The latter species can survive many months without food or water. Their food consists of insects which they capture at night. The young are hatched in the burrows. W. I.

**TRAP DRUM,** a colloquial term for the bass drum used in theatre or dance bands. It is played, together with a small cymbal, by means of a foot-pedal. Sounding the fundamental rhythm with this combination, the trap drummer has his hands free to manipulate countless auxiliary instruments and sound devices. Among these are snare drums, extra cymbals, wood blocks, *maracas* and other rattles, gongs, bird and animal calls, triangles, ratchets, bells, chimes, and whistles of many kinds. W. Li.

**TRAPEZIUM.** *See* GEOMETRY.
**TRAPEZOID.** *See* GEOMETRY.
**TRAPPING.** *See* HUNTING AND TRAPPING.

**TRAPPISTS** are the members of the Order of Cistercians of Strict Observance, a Roman Catholic religious order. The order was founded in 1098 by St. Robert de Molesmes in the Monastery of Cîteaux in France, and reformed in 1664 by Abbot Arman de Rancé of the Abbey of Notre Dame de La Trappe. In 1925 the revised Constitutions of the Order were approved by Pope Pius XI. The Order has about 3,000 professed members in some 80 monasteries throughout the world. The Abbot General of the Order resides in Rome.

The monks follow a strict and austere observance of the rule of St. Benedict, in a common life of prayer and seclusion. They support themselves by manual labor, especially agriculture and cattle raising, in which their skill has always been famous. Among them have been great saints and scholars. Introduced into the United States in 1848, the Trappists numbered in 1954 nearly 800 in six abbeys and three monasteries, of which two (Gethsemane in Kentucky and New Mellary in Iowa) date from 1848 and 1849 and six were founded since 1944. W. C.

**TRAPSHOOTING,** a test of shooting skill, generally with a shotgun, at aerial targets. The original targets were live pigeons, released or sprung from a cagelike affair known as a trap; from this the sport received its name.

**Origin and Development.** Pigeon shooting originated in England in the 1790's and first became popular in the United States in about 1830. A typical set of pigeon-shooting rules dating from the 1860's stated that single birds should be shot at a 21-yd. rise and double birds at an 18-yd. rise, the "rise" being the distance from the gunner to the traps. The butt of the shotgun had to be held below the gunner's elbow until the trap was sprung. A boundary fence was erected at a distance of 100 yd., and a bird, to be scored, had to fall within this boundary and be retrieved by hand within three minutes.

The first artificial targets used instead of live pigeons were glass balls which broke when hit. These were tossed into the air by a spring trap and shot at under rules and in a manner similar to pigeon shooting. The first such device was introduced in the United States in 1866. The glass ball did not prove a very satisfactory substitute for live pigeons and was soon supplanted by a target known as a clay pigeon, invented in 1880. This was a saucer-shaped target made of brittle clay, which, when sprung from the trap with a spinning motion, sailed for a considerable distance in the manner of a discus. Soon accepted as the most satisfactory artificial target for shotgun shooting, this clay pigeon has remained universally popular among trapshooters and has almost entirely replaced the use of live pigeons.

In modern trapshooting at clay pigeons, the gunner shoots in rotation from five stands, located directly behind and a little to each side of the trap to provide variety in the shoot-

ing angle. The distance from the shooting position to the trap is 16 yd. The gunner is scored on the number of hits he makes out of each 25 shots. Skeet shooting, conducted at closer range and at a greater variety of shooting angles, is an outgrowth of the so-called down-the-line style of trapshooting. The record run of hits in regulation trapshooting was set in 1938 by Joe Hiestand, who broke consecutively 1,179 officially judged targets without missing. D. Ho.

**TRASIMENO** [trɑ′zimɛ′no], the largest lake in peninsular Italy, having an area of 50 sq. mi., a perimeter of 33 mi., and a maximum depth of 20 ft. It is on the northwestern edge of Umbria, in the province of Perugia, and its surface is at an elevation of 850 ft. above sea level. Formerly it was believed to have been a Pliocene or post-Pliocene lake, similar to others in several Umbrian intermountain valleys. The present opinion is that it is of recent origin, formed by the filling up of its outlets. Its basin, especially for so large a lake, is very small. There are two small islands: Isola Maggiore, in the north, and Isola Polvese, in the southeast. Trasimeno has no natural outlet. An ancient artificial outlet, which had ceased to carry off the water, was replaced in 1898 by a ditch connecting it with the Nestore River, a tributary of the Tiber. Prior to this, the lower areas around the shores had been subject to periodic and disastrous inundations. A proposal to drain the remarkable shallow lake was dropped when the level of the lake became stabilized. Passignano is on the northern shore and Castiglione del Lago on the western. At Lake Trasimeno, Hannibal inflicted a severe defeat on the Roman army under Flaminius in 217 B.C.

R. G. W.

**TRAS-OS-MONTES E ALTO DOURO** [tra′zuzh mõ′ntzi ɑ′ltu tho′ru], the province in northeastern Portugal which includes the modern administrative districts of Vila Real and Bragança. The region has an area of 7,396 sq. mi. and is bounded on the west by the provinces of Douro Litoral and Minho, on the south and east by the Douro River, and on the north by Spain. Outlying flanks of the Cantabrian Mountains form part of the boundary to the north. The province is one of the least known sections of Portugal. The capital of the province is Vila Real.

Geographically, the major portion of the province is a slope of the great central Iberian plateau. It is granitic and calcareous, with vast sections supporting only enough vegetation to provide pasture for sheep. There are few trees, and villages are small, widely separated, and inhabited by primitive, pious, and conservative people. Tras-os-Montes is the coldest of Portugal's provinces; the climate is raw, and in the winter the temperature often falls below the freezing point. The Montezinho, although not extremely high, is Portugal's only mountain range covered with perpetual snow. The southern part of the province inclines towards the basin of the Douro and the Saber rivers; it has a better soil and in the more protected places has a type of agriculture similar to that usually found in Portugal. This southern verge, known for its port-wine grapes, also produces oranges, lemons, figs, olives, cork, and cereals. Capitals of the two districts of Vila Real and Bragança are the cities of the same names. Pop. 1950, 547,781. *See also* BRAGANÇA; BRAGANZA. J. S. R.

**TRAÙ** or **TROGIR** [trɑu′, tro′gɪr], a town on a little island in the Adriatic Sea, west of Split on the Dalmatian coast of Yugoslavia. As early as the fourth century B.C., a Greek town occupied the site. In Roman times it was called Tragurium. In medieval times it came under Venetian control. Its old bastions near the harbor gate, its fifteenth-century fortifications, its thirteenth-century cathedral, and other beautiful buildings give Traù a medieval aspect. Traù is connected to the mainland by a stone bridge. Pop. 1948, 23,468.

F. Sc.

**TRAUMATOTROPISM.** *See* TROPISMS.

**TRAUTMANN, REINHOLD** [trau′tmɑn] (1883- ), German linguist, was born at Königsberg on Jan. 16, 1883. He studied at the universities of Königsberg, Berlin, and Freiburg im Breisgau, took his doctor's degree at Königsberg in 1906, became *Privatdozent* for comparative linguistics at Göttingen in 1907, and in 1911 was appointed extraordinary professor of Indo-European linguistics and Slavic philology, and director of the Slavic Institute, at the German University at Prague. Thereafter he held professorships successively at Königsberg, Leipzig, and Jena and became a member of the Sächsische Akademie der Wissenschaften and of the Deutsche Akademie der Wissenschaften. For purposes of research he traveled extensively in Russia, Poland, Yugoslavia, and Italy.

Starting his scholarly career with research in comparative Indo-European linguistics and an intensive study of the Avesta, Professor Trautmann later turned more and more to Slavic linguistics, philology, and literature. Believing in a Balto-Slavic unity, he published a Balto-Slavic dictionary (1923). His interest in Slavic literature extends from the ancient Russian heroic lay, the ancient Russian chronicle of Nestor, and the Old Czech *Alexandreis* to such modern authors as Turgenev and Chekhov. He also contributed to the difficult field of proper names in his studies of Old Prussian personal names and Slavic place names.

Among Trautmann's most important publications are *Die altpreussischen Sprachdenkmäler* (1910), *Die altschechische "Alexandreis"* (1916); *Die altpreussischen Personennamen* (1925); *Der Wolfenbütteler niedersorbische Psalter* (1928); a translation of *Die altrussische Nestorchronik* (1931); *Volksdichtung der Grossrussen; Das Heldenlied* (1935); *Zu Form und Gehalt der Novellen Turgenjews* (1942); *Die slawischen Völker und Sprachen* (1947); and *Die Elb- und Ostseeslawischen Ortsnamen* (1949). F. M.

**TRAVAILLEURS DE LA MER, LES** [lɛ tra′vai′yœ′r də la mɛ′r] (*The Toilers of the Sea*), a novel of adventure by Victor Hugo, published in 1866 during the period of the author's exile on Guernsey in the Channel Islands, where the scene of the story is laid. The theme as announced in Hugo's preface is the conflict of man with the forces of nature, and the chief merit of the work lies in the magnificent descriptions of the sea. The hero, Gilliat, by his energy, resourcefulness, and bravery, vanquishes the elements, overcomes a vicious octopus in the most famous scene of the book, retrieves the engine from the wrecked ship *Durande,* and returns for his reward, marriage to Déruchette. Upon learning that the rector of the parish has won Déruchette's affection during his absence, Gilliat drowns himself in despair.

The novel contains many of Hugo's characteristic literary effects: personification of natural objects, astonishing coincidences, frequent antitheses, extensive use of unusual words, elaborate similes and metaphors, and long digressions on technical details. R. A. P.

**TRAVANCORE AND COCHIN, THE UNITED STATE OF** [træ′vənkor ko′tshɪn; kɒ′tshɪn], a state of India, formed in 1949 by the union of the two states of Travancore and Cochin and incorporated in the republic on the

inauguration of the new constitution of India in January 1950. Since both Travancore and Cochin have long and distinguished histories as distinct political entities, each will be considered separately. Pop. 1951, 9,280,425.

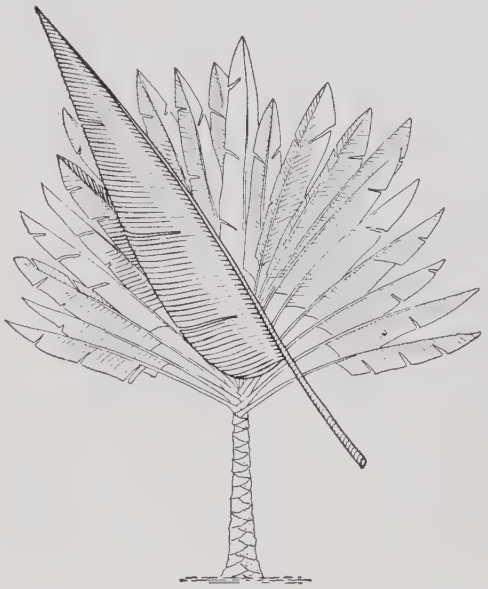
**Travancore.** Travancore, with an area of 7,662 sq. mi., lies at the southwestern tip of the Indian subcontinent. It is bounded on the north by Cochin and by the Coimbatore district of Madras, on the east by the Madura, Ramnad, and Tinnevelly districts of Madras, and on the south and west by the sea. Its rulers trace their descent from ancient Chera kings; the throne is inherited through the female line. For at least a generation the state has enjoyed a reputation as an enlightened despotism, outstanding for its high literacy rate of 47.05 per cent. Of the population, about two thirds are Hindu, and over one quarter are Christians. The Christian community of the Syrian rite traces its connection with the region to very early times, and in modern times both Catholic and Protestant missionaries have operated freely in Travancore. The state has 3,500 schools attended by over 700,000 pupils; the University of Travancore was established in 1936 at Trivandrum, the capital. There are four first-grade colleges, and colleges for law, teacher-training, and Sanskrit.

The state owes its prosperous economic condition to the wealth and variety of its agricultural products. Pepper, in early times the rajah's most important asset in dealing with Europeans, became in modern times but one in a long list of valuable tropical products: coconuts, ginger, turmeric, tea, cardamoms, tapioca, rubber, blackwood, ebony, and teak. Fish are important as food, as are rice, gram, beans, and yams grown on the plains of the littoral. The state has an excellent system of communication via inland waterways and the South Indian railway system, and the government has directly or indirectly subsidized various types of industrial enterprise. The industrial development of the state depends greatly upon power supplied by the Pallivasal hydroelectric scheme, completed in 1940. There are a ceramic plant at Kundara, a sugar and chemical factory, a rubber-processing plant, and a plywood mill at Punalur, an aluminum smelter and a glass factory at Alwaye, and extensive salt-works on the coast. Further schemes for industrial development were projected after World War II. In the spring of 1949, the governments of India and of Travancore jointly financed a corporation with a view to processing annually at least 1,500 tons of thorium-bearing sands.

**Cochin.** Cochin, with an area of 1,493 sq. mi., lies between the northern boundary of Travancore and the Coimbatore and Malabar districts of Madras. Like Travancore, Cochin has enjoyed an enviable reputation as an enlightened despotism with a high literacy rate and an educational system unique in India. The government supported 217 rural libraries, 719 schools with 229,800 students, 9 first-grade colleges, and a teacher-training college. The rajah's capital in modern times was Ernakulam; the city of Cochin, formerly held by the Portuguese and later by the Dutch, became British territory at the close of the eighteenth century, and hence was politically in Madras. This city, as a result of extensive harbor improvements in the 1930's, is the leading port of southwest India.

Cochin, like Travancore, has an unusually high percentage of Christians in its population. The community of "Cochin Jews," most of whom live outside Cochin in the city of Cochin, are said to have emigrated to Cochin before the ninth century. The economy of Cochin is similar to that of Travancore, except that industrial development is more limited and is confined largely to the processing of agricultural products. Fish, coconut products, and timber have a more important place in the economy than is the case in Travancore. H. Fu.

**TRAVELER'S-TREE,** *Ravenala madagascariensis,* of the banana family, native to Madagascar but grown in other warm climates because of its interesting appearance. It grows as high as 30 ft. The palmlike trunk carries alternate



*Traveler's-tree of Madagascar,* Ravenala madagascariensis, *showing detail of palmlike leaf*

leaves on opposite sides, each leafstalk 6 to 8 ft. long, and the shining leaves 4 to 6 ft. more, giving the tree a fanlike appearance. At the base of the stalks are cuplike enlargements containing a refreshing watery sap sought after by thirsty travelers. The leaves are used for thatch and the stalks for the partitions of native huts. J. C. Wis.

**TRAVERSE CITY** [træ′vərs], a city in the northwestern part of the Lower Peninsula of Michigan, the county seat of Grand Traverse Co., on Grand Traverse Bay, 125 mi. north of Grand Rapids. The city was founded in 1847 and incorporated as a city in 1905. A commission and city manager administer the local government. Traverse City is the headquarters for air patrol of the Great Lakes. The National Music Camp, where summer music courses are held annually, is 14 mi. southwest at Interlochen. Of interest in the city is Clinch Park with its miniature replica of Traverse City. Transportation is provided by the Pennsylvania, the Manistee and Northeastern, and the Chesapeake and Ohio railroads and by the Capital Airlines. Although primarily a resort and an important cherry shipping center, Traverse City has a diversified factory output, including processed cherries, automobile parts, electrical items, sprayers, and iron and steel products. Pop. 1950, 16,974.

**TRAVIATA, LA** [lɑ trɑ′vyɑ′tɑ], an opera in three acts by Giuseppe Verdi with a libretto by Francesco Maria Piave based on *La Dame aux Camélias* by Dumas fils. Verdi wrote the opera in four weeks during his work on *Il Trovatore;* it was first performed on March 6, 1853, in Venice, and contains several of Verdi's most poignant melodies, with ensemble music of great sweetness and sonority. Conceived as a "contemporary" opera, it was first performed in modern dress, and this, combined with a poor cast, made the first

performance a failure. A year later, however, the period of the story was put back 150 years, and since that time the popularity of the work has been uninterrupted.

**TRAWLER.** *See* Fishing Vessels.

**TREASON,** a crime the essence of which lies in the breach of allegiance to a government by a person who owes allegiance to it. The English Statute of Treasons, enacted in 1351, is a principal source of the law governing this crime. It declared seven classes of acts to be high treason. The United States Constitution, Article III, Section 3, in defining treason, limited it to two of these classes, declaring: "Treason against the United States shall consist only in levying war against them, or adhering to their enemies, giving them aid and comfort." Treason by levying war requires in general the actual assemblage of men in force for the purpose of overthrowing the government or to coerce its conduct. It is usually committed in internal insurrections directed by persons within the state. Treason by adhering to enemies is considerably wider in scope. It covers in a broad sense any act clearly indicating a want of loyalty to the government and sympathy with its enemies, and which, by fair construction, is directly in furtherance of their hostile designs. It is generally committed in connection with a war waged against the government by a foreign power. Most of the states of the Union, in their constitutions or statutes, have adopted the words of the federal Constitution in declaring what shall constitute treason against the state. E. O. B.

**TREASURE ISLAND,** a novel by Robert Louis Stevenson, written for his stepson, Lloyd Osbourne, and first published in book form in 1883. It recounts the adventures of Jim Hawkins, the son of an innkeeper on the west coast of England, and of Squire Trelawney and Dr. Livesey in their search for treasure buried by the notorious pirate, Captain Flint. The finding of a map in the sea chest of Billy Bones, Flint's mate, after he has been frightened into a fatal stroke at the Admiral Benbow Inn by the appearance of Black Dog and the blind beggar, Pew, is the starting point for a sea voyage, a mutiny, a long fight on the island between the treasure seekers and the buccaneers, and final discovery of the buried plunder. Stevenson originally called his story *The Sea-Cook,* after one-legged Long John Silver, cook of the treasure ship *Hispaniola,* who had once been Flint's quartermaster. This likable and plausible scoundrel is the story's most colorful character. *Treasure Island* has long been established as the very prototype of the rousing adventure tale of buried treasure. J. P. Wo.

**TREASURY, DEPARTMENT OF THE,** an executive department of the United States Government created by act of Congress on Sept. 2, 1789, and charged with the management of the national finances. Its primary functions are the collection of revenues, the disbursement of funds, and management of the public debt. In addition, the department controls the coinage and printing of money, supervises the national banks, and has general responsibility for procurement of Federal supplies. It is required to maintain a complete system of central accounts for the Government, although audit of accounts is under the General Accounting Office. The Treasury participates actively in advance estimating of tax yields. The Treasury is required by statute to make an annual financial report directly to Congress, but it is considered to be an integral part of the executive branch of the government. Lacking the general powers over budgeting and personnel administration enjoyed by its British counterpart, the United States Treasury has never achieved the pre-eminent status of the British Treasury.

The Secretary of the Treasury is the head of the Department and is appointed by the President with Senatorial confirmation. By custom, he is one of the key members of the cabinet. Alexander Hamilton was the first Secretary, and the post has since been held by many noted statesmen, including Albert Gallatin. In 1950, the bureaus within the department included: Comptroller of the Currency, Customs, Engraving and Printing, Internal Revenue, Mint, Narcotics, Accounts, and Public Debt. Other important subdivisions included various divisions engaged in research, the Office of the Treasurer of the United States, Foreign Funds Control, Procurement Division, United States Secret Service, and United States Coast Guard. R. F. St.

**TREASURY NOTES.** *See* Money (*Monetary Units*).

**TREBLE** [trɛ′bəl], a term in music for high voices, instruments, or parts, synonymous with "soprano" except in the case of "treble clef" and "soprano clef," designations of two different clef signs. W. Li.

**TREBUCHET.** *See* Engines of War.

**TREE, SIR HERBERT BEERBOHM** (1853-1917), English actor-manager, was born Herbert Beerbohm in London, Dec. 17, 1853. He was a son of Julius Beerbohm, naturalized grain merchant of German origin, and a half-brother of Max Beerbohm, the essayist and caricaturist. Herbert Beerbohm made his theatrical debut, under the name of Tree, in *Engineering* (1878). His first great success was as the Curate in William Gillette's farce *The Private Secretary* (1884). Three years later he opened the Comedy Theatre under his own management, and soon moved to the Haymarket, where he won a series of successes with plays by Shakespeare and Sheridan, as well as with such new plays as Oscar Wilde's *A Woman of No Importance* and a dramatization of George du Maurier's *Trilby.* The part of Svengali, in *Trilby,* was one of Tree's most popular roles; other parts in which he excelled were King John, Falstaff, Shylock, Wolsey, Stockman in Ibsen's *An Enemy of the People,* Fagan in

*SIR HERBERT BEERBOHM TREE*

CULVER SERVICE

*Oliver Twist,* and Micawber and Peggoty in a dramatization of *David Copperfield.* Tree was knighted in 1909, and died July 2, 1917, in London. J. Ga. and T. G. R.

**TREE,** a large, woody, perennial plant consisting of a root system with one or more main roots and their branches, and a shoot system comprising normally one stem or trunk with branches and leaves. Shrubs generally are smaller and are characterized chiefly by many stems from the same root. Arbitrary limits to distinguish trees from shrubs in the matter of size have been set by various authorities but are not universally applicable.

The tree varies in size from that of the shrub to the largest organisms of the plant kingdom. Its growth and reproduction is dependent upon the living matter or protoplasm in its cells. Moreover, all plants containing the green pigment, chlorophyll, in the cells of their tissues are able to utilize the energy of the sun which is absorbed by the pigment; they take up carbon dioxide from the air through the leaves and absorb water and minerals through the roots from the soil; with these materials they manufacture food in the form of sugars or carbohydrates. This most important process upon which all life is dependent is called photosynthesis (putting together by light). The food, not immediately utilized for growth, is stored in the form of starch in various parts of the plant, such as the roots, and becomes readily available in this way to other living things. The tree might well be called a natural carbohydrate factory.

*Age and Size.* Trees are perennial, that is, they live from year to year, and some individual trees grow to be the largest and oldest of all living things. As in human families, the qualities of age and size in trees are hereditary. The beech family, containing the beech, oak, and chestnut, is noted for its longevity. A chestnut tree, *Castanea sativa,* on Mt. Etna in Sicily, is estimated to be more than 3,000 years old.

For height and girth, if the eucalyptus of Australia is excepted, the conifers hold the record. The following figures, taken from the U.S.D.A. Conservation Year Book for 1954, refer to the largest trees in the United States.

Largest Trees in the United States

| *Name* | *Girth at 4½ ft. from ground* | *Height* | *Place* |
|---|---|---|---|
| Western red-cedar (*Thuja plicata*) | 62 ft. 8 in. | 100 ft. | Olympic National Park, Washington |
| Redwood (*Sequoia sempervirens*) | 62 ft. 8 in. | 308 ft. | Maple Creek, Humboldt Co., Calif. |
| Giant sequoia (*Sequoia gigantea*) | 101 ft. 6 in. (at base) | 272 ft. | Sequoia National Park, Washington |
| Sitka spruce (*Picea sitchensis*) | 51 ft. 6 in. | 235 ft. | Olympic National Park, Washington |
| Douglas fir (*Pseudotsuga menziesii*) | 53 ft. 4 in. | 321 ft. | Olympic National Park, Washington |

Estimates of 1,000 to 2,000 years have been made for these trees. The giant sequoia, though shorter than its relative, the redwood, has a larger girth and is believed to attain a greater age. It has been estimated that some of the trees were already 2,000 to 2,500 years old at the time of Christ, and that a few may possibly antedate the recorded history of mankind. A tree from the Converse Basin Grove is reported to be at least 4,000 years old.

The so-called Cypress of Montezuma of Mexico, *Taxodium mexicanum,* or *micronatum,* also known as the Tule tree, is located in the cemetery of Santa Maria of Tule in Oaxaca. It is 120 ft. high and has a circumference of 90 ft. at the base. Apparently this is the same tree which Ferdinand Cortez mentions in his history of the development of America. Cortez stated that he could encamp all his troops in its shade. De Candolle has estimated its age as 6,000, while von Humboldt considers it to be 4,000 years old.

The baobab, or monkey-bread tree, *Adansonia digitata,* of French West Africa is also considered to be among the oldest of trees. A specimen of this tree, found at the mouth of the Senegal River and with a trunk diameter of 33 ft., has been calculated to be 5,150 years old.

Although no data are available about their age, the tall eucalyptus trees, native to Australia, should be mentioned. The greatest heights of the eucalyptus species are disputed. Some reports have been made of measurements of over 525 ft. The two tallest species are the Mountain Ash, *Eucalyptus regnans,* and the Alpine Ash, *E. gigantea.* The Mountain Ash is believed to reach a height usually between 300 and 350 ft. Official measurements of different individuals of this species include heights of 326, 347, and 362 ft. It can be seen that they eclipse the height of our tallest redwoods. An individual of another species known as the karri, *E. diversicolor,* was found in an official measurement to be 342 ft. tall, although this species usually does not reach the heights of the other two. The outstanding size can perhaps be better visualized with the information that a karri tree, 265 ft. in height, having a girth of 33 ft. at 4½ ft. from the ground, yielded 62,000 ft. of timber and weighed 120 tons exclusive of the branches.

*Uses.* Trees are of incalculable value to man. The most important use is as a source of construction lumber. Paper manufacture, plastics, and plywood also consume large quantities. Fuel is another important use. The bark of certain species of trees yields cork and commercial supplies of tannic acid for leather manufacture; other species give valuable medicinals such as quinine; some contain flavoring substances, such as cinnamon. Very popular beverages including coffee and cocoa are products of trees. Other trees yield latex, a milky sap from which rubber or chicle is obtained. Economically important gums such as camphor belong to another group of tree products. Some woods give us valuable dyes. The sap of some trees is especially sweet in the spring, the starch stored in the wood during the winter having been converted into sugar. This sweetness is particularly pronounced in the sap of the sugar maple, which when boiled down is known as maple sugar. The nuts and other fruits of many trees furnish food.

In addition to these material uses, trees are beneficial to man in many other ways. When in large numbers, as in forests, they prevent floods and erosion of valuable top soil. When planted in rows or belts they act as wind and snow breaks on the farms of the Great Plains. They serve as game preserves and they offer ideal recreation places for camping, fishing, hunting, hiking, and so on. Not to be forgotten is the value of beautiful trees as ornamental features of the landscape.

*Coloration.* The change from the fairly uniform greens of the foliage to the varied assortment of colors—brilliant reds, purples, golden yellows—in autumn, just preceding the fall of the leaves, actually occurs in only a relatively small portion of the world. In the torrid regions, the trees are green during the rainy season. As the dry season approaches, the leaves turn brown and drop off. Occasionally in areas that usually have autumn coloration the same condition may occur when there has been a long period of severe drought in the summer. In temperate regions, however, where the supply of moisture is normally more moderate and con-

tinuous throughout the year and a warmer period alternates with a cold one, coloration occurs. In the southern hemisphere, such a region exists in only a small portion of southern South America. In the northern hemisphere, it covers parts of eastern Asia, southwestern parts of Europe extending northward along the Atlantic coast and eastward through southcentral Europe, and the eastern section of North America. The most beautiful autumn coloration occurs in the northeastern section of the United States, namely, new England, and adjacent Canada, where conditions are ideal.

During the summer, leaves are green because of the abundance of the green pigment, chlorophyll. This substance absorbs all of the light waves, with the exception of the green which it reflects, and these light waves, principally the red and the violet, are used by the leaf to obtain the energy needed in the process of photosynthesis. Chlorophyll is not a "fast" color; throughout the growing season it is continually being destroyed and replaced each day by fresh supplies. In the autumn, because of lowered temperatures and other factors, "old age" of the leaf sets in, the leaves become less and less active, and the chlorophyll is manufactured less rapidly.

As the chlorophyll gradually disappears, other pigments, some of which have been hidden by the chlorophyll during the growing season, begin to show their colors. The carotinoid, or yellow and red, pigments are present in the leaf during the summer in the same plastids or protoplasmic bodies that contain the chlorophyll. Their function is not certain. The principal carotinoid pigment is xanthophyll, a yellow substance which is responsible for much of the yellow in autumn foliage, as in the birch, tulip tree and elm. Xanthophyll is more resistant than chlorophyll to the destructive action of light. Carotene, another pigment, may also be present, imparting a red or orange color. Other reds, as well as the purples and blues, are due to the presence of anthocyanin, a pigment of variable color, in the cell sap. An early frost will destroy the yellow pigments and prevent the production of anthocyanin. The latter pigment develops in the fall with the disappearance of the chlorophyll, with the accumulation of sugar in the leaf, and in the presence of strong sunlight. Low temperatures, but not frost, also promote the production of anthocyanin. In alkaline soils the pigment tends to be blue or purple, while in acid soils it is red. The brilliancy of sumacs, sweet-gum, various oaks, and other trees is due to the presence of this pigment. In many cases it finally undergoes oxidation, which results in a brown color. With a little practice one can recognize many kinds of trees at a distance by their autumn hues.

Autumn coloration can occur only in those species of trees and shrubs which are able genetically to produce the appropriate pigments. For example, the sugar maple, dogwood, sumac, red oak, and sweet gum are among the most favorable types. Coloration develops to the fullest extent when the summers are not too dry, when the temperatures become low without heavy frosts as fall approaches, and when the weather continues sunny, clear, and cool for a long continuous period.

*Poisonous Trees.* Many of our common trees possess, surprisingly, some poisonous qualities. Actually, almost any plant could thus be classified, if all those effecting allergic reactions in individuals were included. The poisons that are produced in the stems, leaves, roots, flowers, fruits, or the sap may be classified chemically as alkaloids, glucosides, organic acids, resins, volatile acids, and others which are not yet identified. Their irritant or toxic effect may occur on the skin, on the nervous system, in the blood, or in the muscles. In the following table are presented a number of those trees which contain specific substances known to be toxic to animals and human beings. In general, all of those listed have an effect only when eaten, with the exception of poison sumac whose oil produces an irritation of the skin in many people on contact with any part of the plant.

TREES CONTAINING POISONOUS SUBSTANCES

| *Tree* | *Poisonous substance* | *Location* |
|---|---|---|
| Balsam poplar | Glucoside | Leaves |
| Black locust | Glucoside (robinin) | All parts |
| Boxwood | Alkaloids (buxine and buxidine)<br>Oil (oil of euphorbia) | All parts |
| Catalpa | Glucoside | Bark and fruit |
| Cherry (also plum, peach, and apple) | Glucoside (amygdalin) | Leaves and seeds |
| Chinese tung-oil | Glucoside (saponin) | Leaves and fruit |
| Ginko | Resin | All parts |
| Hemlock (also Norway spruce and others) | Resin | All parts |
| Horse chestnut | Glucoside | Leaves and fruit |
| Kentucky coffee tree | Alkaloid (cytisin) | Leaves and fruit |
| Magnolia | Glucoside | Leaves |
| Manchineel tree | Oil (Oil of euphorbia) | Sap |
| Pacific yew | Alkaloid (taxine)<br>Oil (oil of yew)<br>Acid (formic acid) | Leaves and fruit |
| Poison sumac | Oil (toxicodendron) | All parts |
| Tree-of-heaven | Glucosides (ailanthin and saponin) | Bark |
| Tulip tree | Alkaloid (tulipiferine)<br>Glucoside | Flowers |
| Walnut | Acid (juglandic acid) | Bark |

## STRUCTURE AND FUNCTIONS OF THE PARTS OF THE TREE

**Stem.** The trunk or stem of the tree and its branches are composed of the following parts: (1) outer bark, (2) inner bark, (3) cambium, (4) wood, and (5) pith.

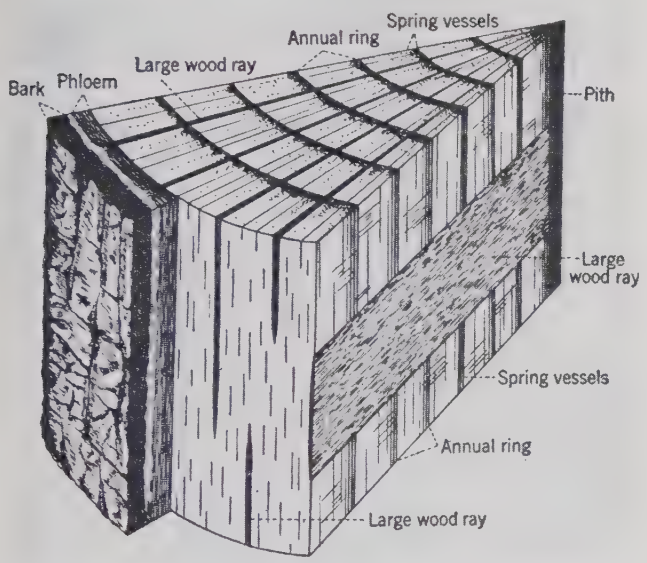
*Outer Bark.* In the young tree plant the outer bark is very thin and is merely the single epidermal layer of the stem which was produced along with the rest of the primary growth. As the tree becomes older, secondary growth is initiated by the formation of an inner cambium or growing layer of cells which produces tissues known as xylem and phloem. (These tissues are described later on.) At this stage of development another kind of cambium called the cork cambium develops beneath the epidermis in the outer portions of the phloem. This cambium produces (to the outside) cells whose walls are impregnated with a waxy substance which is called suberin and is impervious to water. The amount and manner of this bark or cork development vary in different species and result in the characteristic bark of the species.

A feature of the bark in the young stages is the appearance of the lenticels, small dots which indicate the presence of openings through which there is an interchange of gases within the tree and the air without. In the young tree or small twig these lenticels usually have a gray or white color,

but as the tree or branch increases in diameter these dots become lengthened until they appear as transverse lines in the bark.

The function of the dead outer bark is important since it serves to protect the interior parts of the tree from rapid changes in temperature and from invasion by organisms causing disease. Sometimes, indeed, it is of such thickness that it can protect the interior from the heat of a forest fire. The bark of old redwoods is very thick and offers much resistance, but young trees with thinner bark are quickly killed by a light ground fire. This thickness of bark is a critical factor in forest fires. However, the roots usually escape injury in a light fire so that sprouts soon appear. These may equal the old growth in a few years.

*Inner Bark.* The inner or living layer of bark is easily distinguished from the outer layer by its paler color. It can be observed by making a slanting cut on the surface of the tree. It is yellow in the black oak and pinkish in the red



BY PERMISSION FROM "BOTANY: PRINCIPLES AND PROBLEMS." BY SINNOTT & WILSON. COPYRIGHT, 1955, MCGRAW-HILL BOOK COMPANY, INC.

*Pie-section of an oak log. The block shows the three cutting planes: radial, at right; transverse, above; tangential, side with bark partly removed.*

and scarlet oaks. This layer contains conducting tissues functioning in the transport of organic food substances such as the sugars to the growing regions of the tree. It is called the phloem. The phloem cells are of several kinds and differ from the wood cells later described in the fact that they are for the most part living cells. The conducting or sieve cells in the gymnosperms are joined together in the angiosperms to form a sieve tube. The sieve cells or sieve tube elements have perforated areas known as sieve plates on the side or end walls. Adjacent to them in the angiosperms, but lacking in the gymnosperms, are smaller cells called companion cells. In addition, there are fiber cells, non-living with thickened walls, which have a mechanical, protective function.

Since the phloem carries organic or manufactured food to regions of growth, it is of the utmost importance that the flow be uninterrupted. Hence it is that a girdled stem dies or soon will do so. Such a stem has its bark ringed around by a cut as far in as the wood. The roots and in particular the growing points near their tips can then receive no food. This situation applies also to the constriction of the bark when encircled by chains, iron bands, or even strong ropes, as is sometimes done to prevent trees with forked trunks from splitting apart. The only practical prevention in such a case is the use of an iron rod, passing it through the approximate center of the forked branches and securing it firmly at each end.

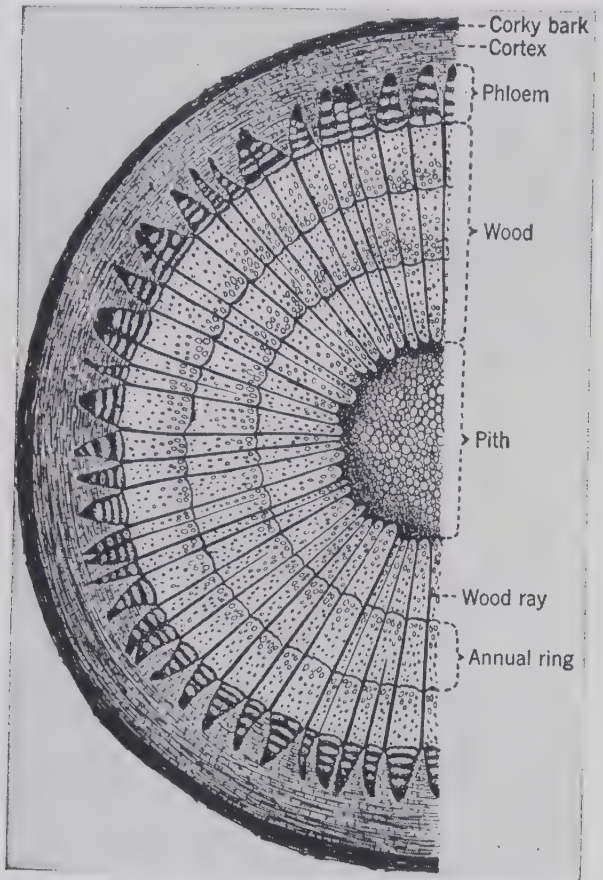
*Cambium.* This is a layer of cells capable of active growth and division, situated between the inner bark and the wood, the latter being known botanically as the xylem. The cambial cells are in shape like long, flattened, four-sided boxes, their wider dimensions being more or less parallel (tangential) to the outer surface of the trunk, and fitting together above and below by beveled ends. They are filled with protoplasm (the living matter) and during the growing season are continually increasing in size and dividing, differentiating new wood cells on their interior side and new phloem cells on their exterior, but usually forming more wood than phloem cells. Thus this cylinder of actively dividing cells is constantly advancing outward and therefore increasing in circumference, leaving behind each year a ring of wood cells, and forming in front a much thinner ring of inner bark. Due to the mechanics of this process a continually increasing pressure is exerted upon the outer layers of the bark which results in cracking, fissuring, and exfoliation of these outer layers.

*Wood.* The primary function of wood tissue or xylem is to carry water and mineral solutions, known as "sap," upward to the leaves. For this purpose many of the wood cells which are derived from the cambium are much elongated in the direction of the tree's length. These elongated wood cells which function in sap transport are of two kinds. The larger vessel-segments are cells with perforated end walls joined together vertically to form "vessels." The smaller elongated cells known as tracheids have small openings known as "pits" scattered in the radial and end walls. There are also wood fiber cells which are elongated, thick-walled cells functioning in support. The tracheid is the only type of conducting cell found in the gymnosperms. The wood cells, as do all true plant cells, possess cellulose walls, usually a primary wall and an inner secondary wall which develops after the cells have completed their growth and elongation. However, wood cells, in addition, undergo a process known as lignification in which a substance called lignin impregnates the cellulose wall giving the hard and woody character to this tissue. In the economy of the plant, lignin serves a double purpose. It does not have the stretchability of the ordinary cellulose wall and so lends rigidity to the tree; nor does it absorb water and swell as can the cellulose cell wall; and yet water passes through it with great rapidity and ease. Thus it is admirably suited for conducting the sap stream up the tree. Parenchyma cells, comparatively thin-walled and with shorter dimensions, functioning in storage of food or by-products such as resins or gums, are also present in the wood. As the living wood, or sapwood, becomes older its cells die and are infiltrated with various substances which darken the color of the whole. It is then known as heartwood and its only function is to support the tree. The importance of this function can be realized when one sees the ease with which hollow trunks in which the heartwood has rotted out are overthrown in windstorms.

Because the first wood cells formed by the cambium in the spring of the year usually have larger cavities and thinner walls, a contrast between spring and summer wood is clearly evident in any cross section of the trunk, in most cases even to the naked eye. The whole thickness of this ring of wood formed in any given year is called the annual

ring, although some authorities apply this term only to the boundary line made by the contrast between the thick-walled summer wood of one year and the thinner-walled spring wood of the next. By counting these annual rings the age of the trunk can be approximately determined.

A method of dating ancient pieces of wood known as cross-dating has lately been developed out of this knowledge.



BY PERMISSION FROM "BOTANY: PRINCIPLES AND PROBLEMS," BY SINNOTT & WILSON. COPYRIGHT, 1955, MC GRAW-HILL BOOK COMPANY, INC.

*Transverse section of a three-year-old tulip tree twig.*

It can be applied in dry regions like our arid southwest where a single factor, that of rainfall, determines the width of an annual ring of wood. Therefore, the proportionate widths of the rings in all of the trees in a given region will correspond. Series of large and small rings can be found which, in their succession, are absolutely distinct and follow a definite pattern. Beginning with any ancient beam or piece of wood, its rings can be matched at some point with those of a younger beam, and so on through still younger beams down to the present, perhaps with the stump of a recently felled tree. Counting backward, the ancient beam can thus be dated.

The method, however, is not always entirely reliable. For example, if the tree becomes defoliated by insects new leaves may be put forth and new growth of the stem and its branches results in the same season; or similarly, if, after a drought, a change in the weather more favorable to growth occurs, new leaves may be developed and a second ring of growth formed in the same year. As a matter of fact, such secondary growth, if caused by insect defoliation, results in a weakening of the tree, since it is accomplished by immature buds intended for the following year, and the new growth has little time to form satisfactory buds for the next year.

In the tropics because of the irregularity or absence of change in the seasons, the annual rings are often indistinct. Here, differences between wet and dry seasons may result in annual rings.

*Pith and Pith Rays.* At the center of the tree trunk or branch is an area of loose, comparatively thin-walled tissue called the pith. In the older and larger tree trunk, the proportion of pith is so small as to be almost invisible. Around this tissue the conducting or vascular system of the tree has developed, and from it, radiating outward into the bark, are plates of thin-walled tissue called the medullary or pith rays, which besides providing for a lateral communication between the wood cells, cambium, and living bark, sometimes contain a store of reserve food during the winter season. These rays do not all extend as far as the pith. New ones are continually being formed by the cambium along with its increase in circumference. The thickness of these rays varies in different kinds of wood. Thus in a log of oak they are prominent in the cross section and they impart the characteristic grain to the "quartered oak." In other woods, such as the maple, the rays are barely distinguishable to the naked eye. In any classification of woods their prominence is of special significance as a diagnostic feature.

The above describes the characteristic internal appearance of trees which belong to the gymnosperm group (conifers and relatives) and to one group (dicotyledons) of the angiosperms or flowering plants. However, in trees which belong to the other members of the angiosperms (monocotyledons) the arrangement differs. The stem or trunk consists of (1) outer bark and (2) inner cylinder of vascular tissue. The structure of the bark varies with the species. In some the successive layers are produced much as in the other groups. In others, bands of bark tissue are produced which join together to form a complex irregular mass covering the stem. In still others such as the royal palms, it is persistent and covers the entire surface with a relatively thin layer.

In the monocotyledons the xylem and phloem tissues are found in clusters known as bundles which are scattered throughout the stem embedded in a less specialized tissue. There is no definite pith region. Secondary growth from a special cambium does not occur. There are no annual rings. In a few tree forms of such plants as *Yucca, Aloe,* and *Dracaena,* the stem is increased somewhat in diameter by the

*Portion of a transverse section of a pine stem, much enlarged, showing cambium, wood, and phloem cells.*

development of new cylinders of bundles of vascular tissue. The main growth in such trees is in length due to the terminal growing point. As is easily observed, such trees seldom, if ever, branch, but consist of a straight unbranched trunk with a cluster of leaves at the apex.

**Flowers and Fruit.** One of the chief functions of the stem of a plant is to bear the flowers and fruit to assure the reproduction of the species. In some kinds of trees the flowers are either minute or inconspicuous as in the elm or are borne so early in the season as in the maple that they escape notice. In others such as the horse chestnut and our

*Transverse section of an oak log showing heartwood and sapwood.*

cultivated fruit trees, they are large and very attractive. Many trees must grow for at least a dozen years before any flowers are borne. The flowers possess the usual sexual organs, the pistils and stamens, which may be in the same or different flowers, and the accessory parts, the petals and sepals. In certain species, the two types of flowers are on the same tree as in the oak, hickory, and birch. In others, the male and female flowers are borne on different trees, for example, in the willow, poplar, and gingko. As the fruits of the gingko have a disagreeable odor, it is possible to avoid them and yet enjoy this easily grown, attractive tree by planting only the male forms. In the conifers, the ovulate scales and stamens are usually produced in very unlike cones. The ovules are borne in the pistils or ovulate scales and the pollen grains develop in the stamens. The latter, on reaching the pistils or ovulate scales by means of insect or wind pollination, form pollen tubes which grow into the ovule, carrying with them the sperm cells, one of which unites with the egg in the ovule. From this fertilized egg, by growth and continued cell division, a tiny embryo develops; this embryo and certain of the surrounding tissues eventually form the seed. Some trees can also reproduce asexually, that is, without seeds. The willow is an example. Its brittle branches which break off, fall to the ground, or perhaps are carried off some distance by a nearby stream, take root easily and grow into trees.

**Leaves.** Although all living parts of the tree co-operate in its life processes, the leaves may be regarded as the most important organs, as in them are first formed the organic foods which serve as a basis for growth and development. To the casual observer, a leaf is just a leaf and nothing more. And yet, on its structure and functions all life, animal as well as plant, is ultimately dependent. For here, within countless green cells, photosynthesis takes place. This process in which sugar, the first organic product, is produced, is of such vital importance to all life that scientists have long endeavored to understand and imitate it and thus make sugar (or carbohydrate) artificially. It has been shown that white or albino leaves or white parts of leaves in which chloroplasts are completely absent, cannot photosynthesize at all, and in order to be kept alive must be supplied with food material from other green parts of the plant, or if isolated, the culture medium must contain some form of sugar, preferably sucrose. Pieces of green leaves can easily be kept alive and functional in a culture medium which supplies water and minerals in solution. More recently, the chloroplasts themselves have been isolated outside of the cell, and these green bodies are able to carry out *in vitro* in the presence of carbon dioxide and water several of the intermediate steps in the process of photosynthesis in the same way as it occurs in the leaf. The studies carried out with these isolated chloroplasts have shown that chlorophyll can convert light energy obtained from the sun into chemical energy in a certain form which is then used in the complex cycle of chemical reactions that follows in the process leading to the ultimate production of sugar. A number of the steps in the process have also been carried out *in vitro* by the use of cell-free extracts without the presence of chlorophyll or light.

The sugar of photosynthesis, in solution, is combined with various minerals, particularly those containing nitrogen, to form proteins, a process which it is now believed is carried on partly in the leaf but mainly in the growing points or wherever a supply of actively growing living matter or protoplasm is at hand. The sugar that is not utilized immediately in this way is converted into starch and stored in various parts of the plant, such as the cortex of the root and stem and the pith of the latter.

If one considers a typical leaf, it becomes clear how well it is constructed and adapted for carrying on its important work. It is composed of a blade and stalk or petiole, although some leaves lack the stalk and then are called sessile. The point of attachment of the leaf is known as the node; the region from one leaf down to the next one on the stem is the internode. The blade of the leaf is thin and flat and arranged in such a way that it is more or less at right angle (or perpendicular) to the light rays. The latter penetrate to all its parts. It is also provided with a multitude of openings known as stomata (singular, stoma) which admit air with its quota of carbon dioxide for photosynthesis and oxygen for respiration. These openings also give off the water of transpiration in vapor form and the carbon dioxide and water which are released in respiration.

The internal structure of the leaf is also such as to pro-

vide for its most efficient functioning in the process of photosynthesis. A typical leaf has lower and upper outer, nonchlorophyllous layers, one cell deep. They are known as the epidermis and contain the stomata through which gaseous exchange occurs. Just below the upper epidermis there is a compact layer of columnar-shaped cells, the palisade layer, containing many chloroplasts. Beneath that and above the lower epidermis is a layer of irregularly shaped and arranged cells, the spongy layer, also containing chloroplasts. The former carry on photosynthesis to the greatest extent, and the latter provide the necessary large surface areas for the exchange of carbon dioxide, oxygen, and water vapor. Running into the leaf from the stem and forming the vein pattern or venation is the vascular tissue of xylem and phloem through which water is transported from the roots and the synthesized material is carried away.

The majority of the broad-leaved trees and a very few conifers (such as the tamarack and bald cypress) are deciduous; that is, they shed their leaves every year. Usually, late in the autumn in temperate regions, a special layer of cells, the abscission layer, begins to form across the base of the petiole or stalk of the leaf. This becomes a region of weakness so that eventually the leaf severs its connection with the tree and falls to the ground. A leaf scar remains on the stem in which may be seen the bundle scars which are the ends of the system of veins into the leaf.

In a large number of the conifers, in many tropical species, and in some broad-leaved trees of the temperate zone, leaves are retained for more than one season and are then known as evergreens. This fact does not mean that the leaves persist indefinitely. The length of time before an abscission layer forms and the leaf drops off, however, is longer and varies. For example, the needle leaves of the conifers may remain on the tree for 3 to 5 years. Only in some trees, such as the palm, does an abscission layer not develop. Such leaves remain until weathering finally disintegrates them completely.

*Winter buds.* Buds are found by examining the end of a woody stem and the axils of the leaves, that is, the angle between the stalk of the leaf and the stem. These buds are composed ordinarily of scale-like leaves (bud scales) on the outside and tiny embryonic leaves within which surround a central cone or growing point. The growing point consists of embryonic cells which, in the growing season, are constantly growing and dividing, forming new embryonic leaves and perhaps embryonic flowers. In our hardwood and coniferous trees, these "winter buds" contain by the end of summer all of the leaves and flowers in embryonic form that will appear when the "buds are shooting" in spring or early summer of next year. Such "shooting" occurs with the advent of warm weather, in temperate regions in late April or early May. It consists practically of an "untelescoping" or unfolding of all parts of the bud; thus the nodes or joints where the embryonic leaves of the bud occur become separated, the internodes being lengthened so that in the horse chestnut, for example, we find in a few days a growth in length of several inches. Immediately upon the unfolding of the leaves, the formation of buds for the following year commences in the axils and at the ends of the stem and its branches. Where the outer scales drop off at the commencement of the "shooting" process they leave tiny rings, and these, of course, mark the beginning of the year's growth in length of the branch. By counting these rings backward the age of the branch or of the whole tree may be estimated.

Most trees in temperate regions, for example, the hickory, birch, and maple, complete their growth in length sometimes in a few weeks or at most by midsummer. In such

trees the growth is called definite or determinate. In some instances, the growth in length may continue until stopped by the frosts of autumn. This is then called indeterminate growth.

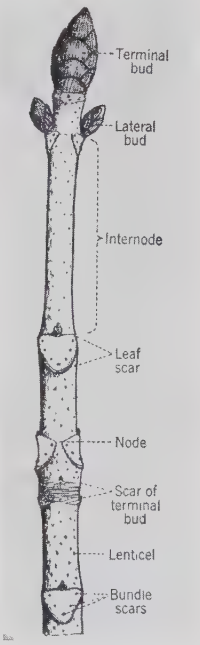
**Root.** The form of the root and its branches and their relative depth in the soil vary with different kinds of trees. In general the oak has long, more or less vertical roots (tap roots), but some kinds, like the pin oak, have a shallow, much-branched root system. Trees with a shallow root system are an easy prey in violent windstorms. Some trees have what appears to be a horizontal root, in reality an underground stem, which sends up shoots at intervals to form a thicket. It occurs in the black locust and various sumacs. A different arrangement is seen in the banyan tree, a native of tropical Africa and India, which sends some of its branches downward to the ground where they take root and form new trunks. In this way a large forest is eventually formed. The banyan tree under which Alexander the Great camped and which is said to have sheltered 7,000 men measures more than 2,000 ft. in circumference and has over 3,000 trunks. The mangrove tree of tropical shores puts out a series of prop roots after the fashion of the midseason roots of our maize or Indian corn. The seeds of this tree germinate while still on the tree and are so weighted that they drop into the water with the root pointing directly downward. By these means the mangrove makes extensive thickets which hold down the soil.

The internal structure of the root is basically the same as that of the stem. However, the arrangement of the tissues differs somewhat. The outer layer of the root, the epidermis, is one cell in depth in the younger parts and the rootlets, whereas in the older parts a bark tissue is produced as in the stem. Behind the protective root cap at the very apex of the root is the growing region. Just behind the tip is the root hair zone where the cells are still rather immature. The epidermal cells of this region possess fine long projections known as root hairs. Further back of the root hair zone the tissues become matured and differentiated. Beneath the epidermis is a layer of parenchymatous cells known as the cortex which is eventually sloughed off in older roots. The innermost layer of cells of the cortex is known as the endodermis. Adjacent to it is a layer of cells known as the pericycle. The pericycle is considered to be the outermost layer of the vascular system. The xylem and phloem in roots are usually in an alternate or radial arrangement which differs from that of the stem. There is no pith. In older roots, a cambium develops which then produces cylinders of xylem to the inside and phloem to the outside in exactly the same pattern as in the stem, so that rings of woody growth also appear.

Branch roots develop internally from a group of cells in the pericycle, rather than from lateral buds on the surface as in the stem. This group of cells undergoes rapid division in an outwardly direction through the cortical and epidermal tissues to ultimately reach the outside.

The chief functions of the root system are (1) to absorb water and mineral solutions from the ground and (2) to hold the tree in place. Absorption of the water and minerals takes place mainly through the root hairs. The root hairs in their growth weave about among the soil particles which, except in very dry soil, are surrounded by a film of water containing mineral solutions. By osmosis, a kind of diffusion, the soil solutions pass through the permeable wall of the root hair and thence are transported through the conducting tissues up the root and into the conducting tissues of the stem.

These delicate root hairs and the fine branch roots are the principal reason for care in transplanting woody or in fact any of the flowering plants. Exposure to the sun or wind dries them out very rapidly so that the tree cannot absorb its customary amount of moisture when transplanted to its new position. Furthermore, because digging around the plant preparatory to transplanting is certain to cut off some of the roots, a considerable amount of the shoot system must be pruned after the tree is set in its new position. Usually about one third of the latest year's growth is cut off. This is of the utmost importance. The reason is that a healthy tree always has a sufficient absorbing system in its roots to supply the leaves with the water they need. If some of this absorbing system is removed, the leaves will wilt. Therefore,



*Horse chestnut twig in winter condition.*

BY PERMISSION FROM "BOTANY: PRINCIPLES AND PROBLEMS," BY SINNOTT & WILSON. COPYRIGHT, 1955, MCGRAW-HILL BOOK COMPANY, INC.

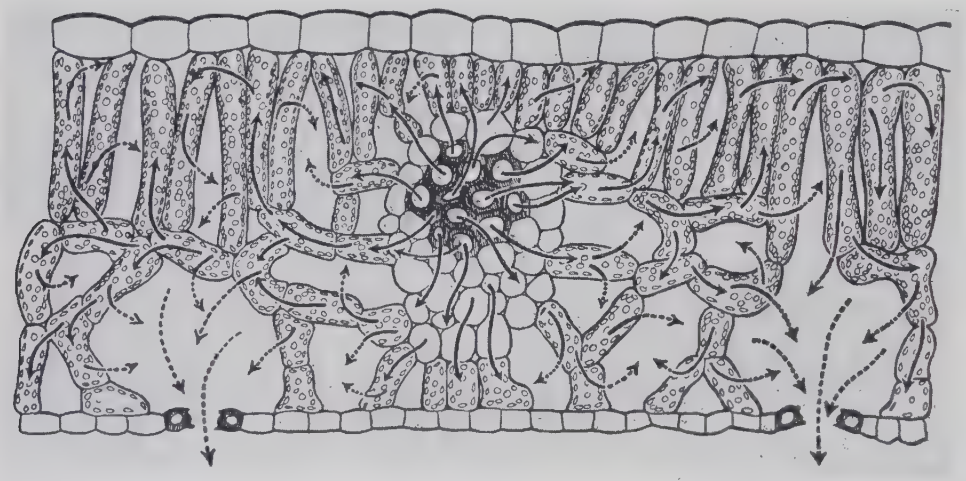
enough of the stem must be pruned away to bring about a balance between roots and leaves. This fact explains why trees are best transplanted in the dormant season, that is, in the fall when the leaves are dropped or in early spring before the leaves of the new year have been unfolded. Even here, however, pruning is necessary against the time when the leaves will appear. Failure to prune often results in the death of the transplanted tree.

### WORLD DISTRIBUTION OF TREE TYPES

In the following section the types of trees will be briefly outlined in relationship to their physical environment, that is, in their ecological relationships. The factors which determine this distribution of trees on the earth's surface are in the order of their importance: (1) Temperature. Great differences exist in the cold-resistant power of the various species, but there are certain limits beyond which a given species cannot survive. This situation is of course dependent, basically, on the sensitivity of the living matter or protoplasm, which varies in different species and even in different individuals of the same species. There may, indeed, in any given locality occur a succession of years with fairly uniform mild weather, but it is the extremely low temperature which occurs only at long intervals of perhaps a score or more of years which is the leading factor as to whether a species will live or can be grown. It should be added that it is often the sudden extreme cold that kills. Bud scales, hairy coverings, thick epidermis, dead and dry outer bark, the presence of oils or sugars in the cells—all these and others are means of protection against a gradual drop in temperature, but may fail when a sudden drop occurs so that the protoplasm cannot adjust itself to the rapid change in temperature. (2) Water. Without water a plant cannot live, and from the above it will be seen how important water is in the distribution of trees. (3) Previous geologic history. In former geologic times the distribution of land masses was much different. For this reason certain kinds of trees occurred in areas now widely separated, in which regions they have often undergone evolution. (4) Other factors, such as the physical character, chemical content, and acidity of the soil, velocity, and amount of wind.

The extreme northern part of North America and Eurasia is known as the arctic tundra, a region of low temperature, often perennially frozen subsoil and drying winds, with a short season for growth during which the daylight is very long. The few trees here are mostly dwarf birch, willow, and juniper. South of this region of arctic vegetation, extending across Canada, Scandinavia, and northern Russia and Siberia, is a broad belt of coniferous forest, the principal species being spruce, larch, fir, and pine, and also some poplar and birch.

South of the coniferous belt is a broad band with various tree types, depending on temperature, precipitation, wind, and man's influence. Beginning with the eastern section in the United States many deciduous trees occur, mixed with conifers in the Appalachian region. Characteristic kinds are elm, maple, beech, oak, hickory, white pine, and hemlock. Related species of most of these trees are found in corresponding areas in Europe, China, and Japan. In the interior parts of the United States the vegetation changes as we proceed westward from the Appalachian. First are the prairies, with little tree growth, now largely given up to agriculture; then with the decreasing rainfall, the Great Plains, mainly grassland; and toward the west and southwest, a semi-desert region. In Europe the plains of Hungary and southern Russia are like our prairies, and with decreasing rainfall these merge to the eastward into grasslands like the Great Plains of the United States. Influenced largely by abundant rainfall and high humidity in the Pacific Coast region, a luxurious growth of conifers occurs from British Columbia to California—redwood, bigtree, red fir, larch, and pine.



*Cross section of a leaf blade showing the path of water (solid arrows) and water vapor (dotted arrows) from a vein through the leaf cells into the air spaces and out through the stomata in the process of transpiration.*

BY PERMISSION FROM "BOTANY: PRINCIPLES AND PROBLEMS." BY SINNOTT & WILSON. COPYRIGHT 1955. MCGRAW-HILL BOOK COMPANY, INC.

Farther south in the warmer, moister regions of eastern North America, comes the pine belt. The Gulf States have live-oak and bald cypress, but in the dry southwest are found mesquite and acacia. The plant life of the Mediterranean region is similar in character.

All these changes in tree growth as we travel southward from the Arctic are repeated in the high mountain areas of the tropics or even in the Rockies and the Alps. At the summit of these ice-capped mountains we find the arctic vegetation, farther down come the coniferous species, and next the broad-leaved deciduous trees mixed with conifers, and finally, if we are in the region of the lofty Himalayas, the luxurious tropical tree growth at the foot.

In the broad belt between the Tropics of Cancer and Capricorn, the conditions at low altitudes are ideal for tree growth wherever rainfall is abundant, as in the Amazon Basin, much of Equatorial Africa, India, Burma, and the East Indies. Tall trees make a dense cover and many woody

vines twine around the trees. Epiphytes or "air plants," mainly orchids and members of the pineapple family known as bromeliads, grow on the tree trunks. Growth is so rapid in these tropical forests that a clearing returns to a wild state in a few months. The tree species are numerous compared with those of temperate regions, and a few species do not dominate the vegetation as in the northern forests. However, in a large part of the tropics tree growth is comparatively rare. Much of central Africa, a high plateau, is grassland. In the Sahara Desert, Arabia, and much of interior Australia, rainfall is so scanty that there is relatively little tree growth.

South of the tropics there is no large land mass as in the north temperate zone and there are no large forests. In western Paraguay and Argentina the pampas or grassy plains resemble our prairies, but in parts of Chile where rainfall is high there are evergreen forests somewhat like those of the Pacific Coast of North America, which have been described above.

## TREES IN RELATION TO MAN AND HIS ENVIRONMENT

**Weather and Climate.** By "weather" is meant the conditions of air pressure, atmospheric moisture or humidity, the wind, sun, clouds, and rain from day to day; by "climate" is meant the average weather over a long period for any given region. There is a prevalent belief that trees have an important effect on weather, but, according to the most up-to-date research, the effect is slight. It is an established fact that trees give off, mainly through the stomata in their leaves in the process known as transpiration, enormous amounts of water during the growing season. A medium-sized elm tree gives off more than a ton of water a day, and an acre of beech trees 30,000 barrels in a summer. But this water vapor becomes quickly merged with the great volume of the upper air currents so that its effect is practically negligible. Weather is controlled by a world-wide distribution of temperature, barometric pressure, and wind, that is, by the general circulation of the atmosphere in the higher strata far and away beyond the effect of any local contribution such as might result from a few trees or even from a forest. Of course, within the forest it is cooler, the wind is practically nil, the air is moister, and the shade is an important factor, so that it might be said that the forest has a pronounced influence on the weather. But this condition is true only of the weather in the forest, not out of it. It is the protection that the forest or even one or more large trees offer to other smaller plants, and also animals, that is of significance with regard to weather conditions.

**Erosion.** Although trees have little effect on the weather and climate as a whole they are of tremendous importance in preventing erosion, that is, the wearing away of the soil. When the rain falls, part of it is intercepted by the leaves and branches of the tree and much of this is evaporated, but the larger part drips to the ground where it joins the rest of the rainfall and sinks into the forest floor. There is some evaporation there and also transpiration of moisture from the leaves, but if there is an abundance of leaf mold and litter much of the water is absorbed as by a sponge, and when that surface layer becomes saturated the excess sinks to lower levels where it joins the water table. Thence it moves slowly through the subsoil toward the streams, maintaining their flow. Another favorable influence of the forest is seen in the slower melting of the snow. In this way it also helps to regulate streamflow. If, on the other hand, there are no trees or vegetative cover of any sort, the water runs off quickly, picking up particles of soil as it goes, and thus wears down or erodes the soil. These facts show why forests are necessary for water sheds and why reckless cutting often results in flash floods and gullies that carry away valuable topsoils, dams, and bridges and even sometimes change the course of streams.

**Wounds.** The exposure of living cells of the inner bark of a tree due to hail, wind, insect puncture, or human agency makes an easy entrance for fungi and insects, resulting in disease or even death of the tree. Whenever a wound is thus made the surrounding healthy tissues immediately take up the work of healing the injury, their cells growing and dividing and forming what is known as a callus. If the wound is not large the callus tissue quickly meets from all sides, thus completing the healing process. In many of the conifers the resin canals, which traverse the bark and often also the wood, fill up the wound with resin, thus effectively shutting out disease organisms. In cutting limbs from trees care should be taken to saw the limb off flush with the trunk so that a callus can grow out on all sides of the cut, eventually

Four Major Fungal Diseases of Trees

| *Disease* | *Fungus* | *Tree* | *Effect* | *Treatment* |
|---|---|---|---|---|
| Chestnut blight | *Endothia parasitica* | Chestnut | Attacks living bark and girdles trunk, killing tree | Removal of diseased trees. Development of resistant types. |
| Dutch Elm Disease | *Ceratostomella ulmi* | American elm | Plugs up wood cells. Causes wilting of leaves. Produces a poison which kills tree. | DDT spray to kill beetles that spread the fungus. Biquinolin sulphate to kill fungus spores. Plant resistant species of elm. |
| White pine blister rust | *Cronartium ribicola* | White pine (also eastern white pine and sugar pine)<br>Gooseberry and currant (required alternate hosts) | Girdles stem, killing tree. | Removal of gooseberry and currant shrubs in the vicinity of pine. |
| Oak wilt | *Endoconidophora fagacearum* | Various oak species, Chinese chestnut, and others | Plugs up wood cells. Causes wilting of leaves. Produces a poison which kills tree. | Removal of diseased trees. |

covering the cut surface; otherwise a stub is left which can never be healed over but will serve as a continual menace, since it offers a pathway for disease and insects to reach the interior of the tree.

**Diseases of Trees.** A disease of a tree may result either from unfavorable conditions of the non-living environment, or may be caused by the attack of living organisms. Among the former are conditions of extreme cold or heat, unfavorable soil conditions such as high acidity, the presence of poisonous chemical substances, too much or too little water, lack of porosity, or the presence of lethal gases in the atmosphere, and so on. The causal living organisms of greatest importance are classed almost entirely among the group of the fungi and the viruses which seem to be increasing in number, but actually only because our knowledge of them is enlarging. Insects are not considered disease-inducing organisms, at least not in orthodox academic circles. The damage they cause is classed as an injury which, it is true, is often the primary cause of secondary fungous infections. In the above table are given a few of the important fungal diseases of trees.

**Insects Injurious to Trees.** The greatly increased communication between all parts of the world in recent years due to airplane travel especially has brought about the introduction of many insect pests and diseases new to the United States. An absolutely tight and effective barrier against the many diseases and pests in foreign countries is the aim of our government. Many of these are not serious in their own country, but after they are introduced here they are free from their natural enemies, and furthermore often find new species to attack which have not suffered before. Hence their destructiveness may be much greater than in their native land.

The gypsy moth, *Porthetria dispar,* is an example of the disastrous results of the entrance of a non-native species of insect into the United States. The eggs were brought from France to Medford, Mass., in 1869 by a French scientist who had conceived the idea of crossing this insect with silkworm moths in order to produce a hardy silkworm. Some of his gypsy moths escaped, and several years later the moth had increased to sufficient numbers to become conspicuous. At the present time this pest, which eats the leaves of most forest trees including the oaks, infests most of New England and the eastern part of New York State. It is estimated that the average yearly damage amounts to one and one half million dollars. The caterpillar stage, at which the feeding is done, can be easily identified by the pairs of blue and red dots down the back. Control is effectively accomplished by spraying with DDT which can be economically applied from an airplane.

The white pine weevil, *Pissodes strobi,* that attacks the terminal shoots chiefly of the white pine, but also Norway spruce, jack and other pines, and sometimes other conifers, causes considerable loss by killing the main leader of the tree. It does this by laying eggs in the bark of the young shoots. On hatching, the small white grubs feed on the living inner bark, boring downward and killing the shoot. In subsequent years a side shoot may replace the main leader, but this inevitably results in a bayonet form of the trunk which ruins the value of the tree for lumber and mars it from an ornamental point of view. Young plantations may be protected somewhat by removing and burning the infested shoots as they appear.

Among other destructive insects, especially notable are the birch-leaf skeletonizer or miner, *Buccalatrix canadensisella,* that attacks the leaves of gray, paper, yellow, and European white birch; tent caterpillars, *Malacosoma* sp., whose tents are commonly seen in the crotches of wild cherry and apple during May and June; cankerworms that appear especially in spring when the leaves are unfolding, but also in the fall. The latter are the larval stages of several species and can be controlled by DDT applied in a spray as soon as the eggs hatch.

**Fire Damage.** All the damage and loss from diseases, insects, hurricanes, ice, snow, and hail storms becomes dwarfed when it is compared with the tremendous losses caused by forest fires. Nineteen hundred forty-seven is considered an average year for forest damage in the United States. In this year 200,299 forest fires burned over 23,226,000 acres—an area the size of Indiana—causing tangible damage amounting to more than $55,000,000 to timber, farm homes, barns, towns, and school houses. Besides this, the killing of the young growth in the forests, many years on its way to making forest trees, destruction of the valuable humus on the forest floor, spoilage of the watersheds and recreation areas, and killing of wildlife can easily amount to double the direct loss from fire.

That fire fighting and fire prevention in our forests is a business of major importance, and everyone's business, the public is beginning to realize. More effective methods of fire fighting and a better organization of fire-fighting crews, new fire towers for points of observation, and increased means of telephonic communication in dangerous areas are continually being developed, not only by the forestry bureaus in the individual states, but by the Forest Service in the Federal government.

**Tree Breeding.** The breeding of plants or animals is defined as propagation for the purpose of their improvement. Trees can be bred so that their offspring will resist diseases or insect pests and also for other desirable qualities such as rapid growth, good form, large size, fine quality of wood, better fruit, and so on.

There are two methods of breeding: (1) by selection, in which the best trees are selected and propagated vegetatively, that is, by cuttings or by grafting; and (2) by sexual generation in which one tree is used as the male and another as the female. The flowers containing the sexual organs are deprived either of their stamens, the male organs, or of their pistils, the female organs, according to the sex required for the breeding. The missing sex is supplied by transferring it from another tree. In generative breeding, selection is also involved, for the parents having the desired character, such as disease resistance, are selected for making the "cross," as the process is called.

Many forest experiment stations are now breeding through selection, and specifications for "elite" trees have been published. Generative tree breeding, however, is being carried on in comparatively few places. The Eddy Tree Breeding Institute at Placerville, Calif., established in 1924, now a branch of the U.S. Forest Service, specializes in breeding pine. The grounds of the Institute contain 90 world species of pine, and 70 new hybrids have already been produced by generative breeding. Some of these hybrids show much promise in greatly increased rate of growth over that of their parents and are being tested in various plantations. The Lake States Forest Experiment Station at St. Paul, Minn., is concentrating on the breeding of spruce. The Northeastern Forest Experiment Station at Chestnut Hill, Pa., is carrying on breeding experiments with a variety of trees, notably birch, maple, poplar, and spruce. In Rutgers University at New Brunswick, N. J., holly is being bred for ornamental purposes. The Boyce Thompson Institute at

Yonkers, N. Y., is conducting extensive experimental work on larch breeding. The Connecticut Agricultural Experimental Station is breeding races and species of hemlock as well as continuing the work in chestnut breeding begun by the Brooklyn Botanic Garden in 1930. The latter is being done in an effort to restore the chestnut as a forest tree to eastern North America. The U.S.D.A. at Beltsville, Maryland, Horticultural Crops Research Branch, is carrying on a similar project. At Harvard University, the Maria Moors Cabot Foundation is breeding poplar and has succeeded in making a valuable cross of white and Himalayan pine. In Florida, under the direction of the Southern Forest Experiment Station, experiments have been going forward for some years which have for their objective the breeding of pines with a higher yield of resin. These are only a few of the institutions and projects in which sexual breeding or crossing is now in operation. There are many others in which selective breeding is being done.

As has been said, next to food, wood is perhaps our most important organic materials. Later on, its many uses will be discussed. Statistics show that we are now using half again more wood than we are growing. The breeding of better, faster-growing trees is therefore of the utmost significance to the welfare of the nation.

**Street and Shade Trees.** It is hardly necessary to state that a street bordered on each side with healthy, vigorous trees is infinitely more attractive than one without them. Moreover, trees provide shade and lower the temperature on hot sunny days. In addition, it should not be forgotten that the presence of beautiful trees results in much-increased property values. This is all true whether it is in the city, suburbs, town, village, roadside, or lawns surrounding a private home.

For their ideal growth and development on streets, trees should not be planted between the curb and the sidewalk unless there is a strip ten ft. in width. A narrow strip of two or three ft., as is sometimes seen, theoretically does not allow for healthy growth, or sometimes even survival. However, in many cities such as New York City trees which have grown for years along the street do not have more than a strip of two or three ft. and sometimes even less space than that is provided; yet they appear to be in a fairly healthy state. Nevertheless, if the houses are some distance from the sidewalk it is far better to plant in the space between the walk and the house. The larger area thus available for root growth will pay big dividends in increased vigor of the growing trees.

Street trees are often planted too close together. The ideal spacing for the larger-growing kinds is 50 or 60 ft. apart, for medium-sized trees 45 or 50 ft., and for small trees 40 or 50 ft. Several recent hurricanes in the eastern United States, resulting often in almost catastrophic losses, have focussed attention on the relation of street trees to the utility wires overhead. In many places, the overhead wires are being replaced by underground systems, so that the problem may eventually disappear in this way. The planting of smaller trees which will not interfere with such wires is now being advocated. At the same time more attention is also being given to the pruning of dead limbs and removal of trees with hollow trunks, to safeguard against future hurricane damage.

Trees for city planting should possess the following characteristics: ability to endure severe winters (this applies to the northern states); ability to withstand initial transplanting; tolerance of city dust, smoke, and gases; tolerance of poor soil; abundant shade; pleasing foliage and habit of growth; suitability of size (fair size but not enormous); suitability of root system (not filling drain pipes or raising sidewalks); freedom from "suckering," that is, production of young basal shoots; comparative freedom from litter, that is, objectionable casting of flowers, twigs, and messy fruits; freedom of flowers and fruits from objectionable odor; resistance to disease and insect attack; resistance of trunk and branches to breakage in storms. On the basis of these specifications one might select the following trees to serve as ideal street trees in almost any section of the United States. In the order of preference they are: Norway maple, *Acer platanoides;* gingko, *Gingko biloba* (male form); pin oak, *Quercus palustris;* and London planetree, *Platanus acerifolia.* These four species of trees have been selected because they fulfill all the requirements for an ideal tree. Furthermore, they are easy to obtain in any nursery. There are, however, many other kinds which can serve as street trees and give entirely satisfactory results.

For suburban sections somewhat removed from the city proper, the streets of smaller towns and villages, country roadsides, and lawns not restricted by all of the above factors which are so necessary to consider in the city, the variety of trees that may be planted is greatly increased. Since it is not a question of which will manage to survive, the species will then depend upon special features desired or not desired, such as growth, appearance, longevity, autumn coloration and so on. However, the particular section of the country and its climate and soil conditions must also be taken into consideration in selecting the kinds of trees.

In the northeastern United States such trees as the sugar maple, elm, red, white and scarlet oak, tulip tree, sweet gum, American linden, European beech, honey locust, and hackberry can be considered good for general planting. Factors such as the brittle branches of the sugar maple and tulip tree may be important where there are many storms. On the other hand, others such as the longevity of the tree may be more important elsewhere in addition to attractive appearance and autumn coloration. The Dutch elm disease must be remembered in connection with the elm. However, there are areas free of this fungous disease where it is possible to plant it satisfactorily. Although not outstanding for most street plantings and as shade trees, evergreen conifers such as the eastern hemlock, red and white pine, white fir, and various species of spruce may be planted and achieve good growth, especially on lawns.

In the southwest, live oak, southern magnolia, camphor tree, willow oak, red maple, flowering dogwood, sweetgum, American holly, American beech, water oak, and cabbage palmetto are among those species which are good for street and shade plantings.

In the plains and prairies region, the soil is a very important factor and cultivation is often necessary after the trees have been planted. Good street and shade trees include the green ash, plains cottonwood, American elm, Siberian elm, hackberry, bur oak, tree-of-heaven, and Kentucky coffee tree.

Native trees are relatively rare in the Rocky Mountains section, but many have been planted. These include the black locust, box elder, Siberian elm, tree-of-heaven, green ash, linden, Norway maple, and also conifers. The first three are best able to survive with minimum care the climate and soil conditions of this section of the country.

The Pacific Coast may be divided into two sections, California and the North Pacific. In the former, the California live oak, southern magnolia, London planetree, sweetgum, and various conifers do well. In the North Pacific, the best

choice is among the hackberry, American yellow-wood, sweetgum, and various conifers.

## TREE PRODUCTS

**Wood.** Of all the materials and substances formed by plants, wood is without doubt the most useful and valuable to man, if the grains, tubers, fruits, nuts, and so on, used to nourish and sustain human life itself are excepted. It has been said that there are over 4,500 different uses of wood, but when the modern plastics and the multiplicity of their forms and uses are considered, this number could easily be greatly enlarged.

*Characteristics of Wood.* All woods are divided into two classes: (1) softwoods and (2) hardwoods. The former occur in cone-bearing trees such as pine, spruce, larch, and fir and contain in their structure, with rare exceptions, only one form of cell. The latter or so-called hardwoods are those of broadleaved trees such as the oak, birch, maple and basswood, and usually contain four kinds of cells in their structure. One of these kinds consists of vessels or ducts, the chief function of which is to carry up the sap from roots to leaves. If the vessels are arranged in rings as in the oak or ash, with one ring per year, the woods are called ring-porous; if the vessels are distributed more or less equally throughout the annual ring, being also often invisible to the naked eye, the woods are called diffuse-porous, such as in the birch, beech, and cherry.

This classification of all woods into hard and soft is rather misleading since there are many so-called softwoods that are hard, and vice versa. The problem arises from the fact that the classification depends upon the botanical characters of the trees and not strictly on the relative hardness or softness of their wood. There are some conifers known as softwoods such as the larch, hemlock, and red fir whose wood is actually hard. Some of the southern pines, as for example the longleaf pine, are hard and durable, being well impregnated with resin, and consequently are often used as construction timbers. The white oak is our most valuable hard wood. The most important and valuable conifers are the Douglas fir and white pine.

The lightest hardwood reported in the literature is the palo bobo de agua, *Aeschynomene hispida,* of Cuba which has an air-dry weight of 2.75 lb. per cu. ft. This species is actually little more than a shrub. The lightest wood available in what could be considered commercial size is quipo, *Cavanillesia platanifolia,* of Panama and Brazil. This species has an air-dry weight of 6.5 lb. per cu. ft. Balsa, *Ochroma* sp., of Ecuador and Central America is only slightly heavier, commonly weighing 7 to 9 lb. per cu. ft. when dry. It is undoubtedly the lightest hardwood in common use, and is readily available.

The heaviest wood on record is letterwood, *Piratinera guianensis,* from Surinam, which weighs 90 lb. per cu. ft. when air-dry. A close second is the black ironwood, *Krugiodendron ferreum,* of southern Florida, Cuba, and Central America. The heaviest well-known timber of commerce is lignum vitae, *Guaiacum* sp., of the West Indies which has a weight of 78 lb. per cu. ft. when air-dry.

The wood with the highest bending strength is kaneelhart, *Licaria cayennensis,* of Surinam and British Guiana. Expressed on the basis of the load that could be carried by a 2 by 2 in. beam mounted on a 28 in. span, this wood could support a load of 6,300 lb. at the center. A comparable beam of quipo could carry only a 250-lb. load.

The hardest wood on record is one that was tested a number of years ago at the University of Michigan. It is flor amarillo, *Tabebuia spectabilis,* of Venezuela. This wood has a side hardness of 4,120 lb. when tested air dry. This is the load required to embed a steel ball of 0.444 in. to a depth of one half of its diameter in the wood. At the other

extreme is balsa which has a side hardness of only 76 lb. when air dry.

*Lumber.* Lumber is the name for sawed timber, timber being the word for trees standing in the forest. Lumber is the most important use of wood. It is used principally in house construction, for sills, studs, flooring, laths, shingles, and trim, also sheathing, and for construction timbers in general. Railroad ties, cooperage, mine timbers, and utility poles make use of a large portion. It is also used in the manufacture of such items as boxes, crates, furniture, agricultural implements, boats, baseball bats, pencils, woodenware, caskets, automobile and truck bodies, musical instruments, tanks, and veneer. The various characteristics of different woods make certain species preferable to others in the manufacture of the products mentioned. For example, the woods of ash, Douglas fir, redwood, western red cedar, cypress, and tamarack are among those preferred for the construction of cross ties.

The highest grade veneer is made from the wood of black walnut, white oak, and exotic species such as mahogany, Spanish cedar, and rosewood. Others include Douglas fir, red gum, tulip tree, and ponderosa pine.

The important furniture woods are mahogany, maple, oak, walnut, birch, and fruit-woods. Mahogany is the world's finest cabinet wood. The Wesst Indies mahogany, *Swietenia mahagoni,* found in the West Indies and to some extent in Florida, is the most valuable timber tree in tropical America. Various cabinet woods including another mahogany, *Khaya* sp., come from the west coast of Africa. Brazilian rosewood, *Dalbergia nigra,* of tropical America, satinwood, *Chloroxylon swietenia,* of Ceylon and East Indies, and marblewood, *Diospyros marmorata,* of Andaman and Nickobar Islands, are among other important cabinet woods.

Teak, *Tectona grandis,* found in India, Indonesia, the Philippines, Burma, Malaya, and Thailand, is the most important timber tree in Southeast Asia. It is strong and durable and is superior to most other woods for shipbuilding.

In Australia, the eucalyptus is of economic importance as a timber tree. It is fast-growing, with very durable lumber used for general building purposes. The red-cedar, not a conifer, is a fine-grained wood, light, soft, easily worked, fragrant, and very durable when exposed to weather. It is valuable for cabinet work, panelling, and building of light boats.

Considerable amounts of lumber are finely ground and enter as "wood flour" into the composition of linoleum, explosives, and plastics. Another of the prime uses for wood is, of course, as fuel.

*Charcoal.* This product is made by heating wood and preventing its oxidation in charcoal kilns. It is practically pure carbon and is much used as a domestic and picnic fuel, is used in smelting and refining various ores, in making carbon disulphide, which is itself used in making viscose, rayon, and cellophane; it is also important in the preparation of sodium cyanide, a powerful disinfectant. Softwoods of willow, poplar, and maple are among the best woods for this purpose.

*Plywood.* Plywood is formed of sheets of veneer peeled off a section of trunk by special machinery. These thin layers of veneers of wood are bound or glued together by the use of the modern thermosetting resins and united under pressure into a firm bond. Such modern plywood is waterproof and resistant to decaying bacteria and fungi. It is said that plywood has greater strength per unit of weight than have the metals. Bodies of busses and of railroad cars and hulls of small boats make use of this strong, lightweight, all-weather material. Plywood panels are now in demand for buildings because of their large size and uniform strength. New techniques have released plywood from its original role as only a flat sheet material. Now it can be molded to form compound curves. Douglas fir and ponderosa pine are among the species of trees used in the manufacture of plywood.

*Laminated Wood.* Mention should be made of modern laminated wood. Briefly, this is the preparation of timbers which are to be subjected to stress such as large arches in building construction or even tennis racquets. It is made by firmly bonding strips of wood together under pressure, using the modern resin glues, the grains of the wood of different pieces running parallel. In plywood they are usually at right angles in successive plies. By this method of treating wood, defective sections of lumber can be eliminated and short dimensions, otherwise useless, can be pressed into service. Since much of our lumber is now from second growth which is often defective timber, the laminated process is of much economic importance.

*Source of Chemical Substances.* Chemically, wood is a carbohydrate, not very far in its composition from sugar and starch. It contains among other things a considerable amount of cellulose, and by chemical treatment this cellulose becomes the pulp used for paper and paper products. It is also used in the manufacture of rayon, cellophane, nitrocellulose, plastics, and many other important materials.

In many wood-utilizing processes, such as paper pulp manufacture, the lignins become separated from the cellulose as they are insoluble with acid used in these methods. Lignin consists roughly of a third of the chemical constituents of wood. Unused lignins when returned to the soil help to maintain it in a good physical condition. The lignins available from American pulp mills were estimated in 1949 at 3,500,000 tons a year. Recently many other uses have been found for this lignin residue. It is a source of vanillin and related compounds. It is also used as a dispersing agent for Portland cement, used in the negative plates of storage batteries, and for the production of tannins. It helps as a binder for foundry cores, is an ingredient in linoleum cement, and is used as a road surface binder.

By destructive distillation of wood, methyl or wood alcohol is obtained which is useful as an anti-freeze in automobile radiators, as a solvent in many industries, and for making formaldehyde, one of the principal ingredients in the manufacture of plastics. Other products are acetone, used as a solvent in the rayon and plastic industries, and acetic acid used in making white lead paint and acetate rayon and films.

When wood is hydrolyzed, that is, heated with a dilute solution of acid in water under moderate steam pressure, sugars are formed to the extent of about one half of the weight of the wood. These sugars, a mixture of glucose and several other forms of sugar, would be difficult to purify, but can be evaporated easily to a molasses that contains 50 per cent sugar. This molasses is being tested as an animal feed and preliminary results show that it is palatable to cattle and sheep. The sugar solution resulting from hydrolysis can also be fermented into grain or ethyl alcohol, useful for many industrial purposes. If, and when, petroleum products begin to fall, ethyl alcohol could become one of the most important motor fuels. At present it can be produced from wood at about one fifth of the cost of producing it from grain.

Among other chemical substances obtained from wood are turpentine and tar which are valuable in the preparation

FLAVORINGS AND MEDICINALS

| *Product* | *Tree* | *Country* | *Part Used* | *Use* |
|---|---|---|---|---|
| Balm of Gilead and Balsam poplar oil | Poplar (*Populus candicans* and *P. balsamifera*) | Northern United States, Canada | Buds | Stimulant, expectorant |
| Camphor Oil | Camphor (*Cinnamomum camphora*) | Asia, Malaya, China, Japan, United States | Wood and leaves | Salves, soap, perfumery |
| Cascara (powder) | Cascara (*Rhamus purshiana*) | Northwestern United States, adjacent Canada | Bark | Tonic, laxative |
| Cherry powder | Wild cherry (*Prunus serotina*) | Eastern United States | Bark | Expectorant, simple bitter |
| Cinnamon | Cinnamon tree (*Cinnamomum loureirii*) | India, Malaya, Ceylon | Bark | Aromatic, flavoring agent |
| Citric fruit oil | | | | |
| Orange Oil | Orange (*Citrus sinensis*) | India, United States, Italy, France | Fresh peel of ripe fruit | Flavoring, carminative |
| Lemon Oil | Lemon (*C. limon*) | Same as above | Same as above | Same as above |
| Oil of Bergamot | Bergamot (*C. bergamia*) | Southern Italy, France | Same as above | Perfumery, cosmetics |
| Clove Oil and Powder | Clove tree (*Eugenia caryophyllata*) | Java, Malaya, India, Madagascar | Flower Buds | Antiseptic, flavoring |
| Cocoa Powder and Butter | Cocoa (*Theobroma cacao*) | West Indies, South and Central America, Mexico | Ripe seeds | Nutrient beverage |
| Coconut Oil | Coconut Palm (*Cocos nucifera*) | Philippines, East Indies, Ceylon, tropical America, Africa | Kernels | Manufacture of soap, cosmetics, shampoo |
| Coffee | Coffee tree (*Coffea arabica* and other species) | South and Central America, West Indies, India | Seeds | Beverage, flavoring |
| Juniper (powder) | Juniper (*Juniperus communis*) | North America, Eurasia, North Africa | Dried ripe fruit | Stimulant, diuretic, flavoring |
| Kola (powder) | Kola (*Cola nitida*) | Africa | Seeds | Cerebral, cardiac, nerve stimulant |
| Mace | Nutmeg tree (*Myristica fragrans*) | East Indies, India | Dried seed attachment | Flavoring, pharmaceuticals |
| Nutmeg | Same as above | Same as above | Dried seed kernels | Same as above |
| Oil of Eucalyptus | Blue-gum (*Eucalyptus globulus*) | Australia, Tasmania | Dried leaves | Stomachic, carminative, expectorant, antiseptic |
| Oil of Wintergreen | Sweet birch (*Betula lenta*) | Eastern United States | Bark | Antirheumatic, flavoring |
| Olive Oil | Olive tree (*Olea europaea*) | Countries of the Levant | Ripe fruit | Nutritive, laxative, emollient |
| Palm Oil | Oil Palm (*Elaeis juineensis*) | West Africa | Fruit | Manufacture of soaps, candles, ointments |
| Papain | Papaya (*Carica papaya*) | Tropical America | Dried and purified latex from fruit | Protein digestant, meat tenderizer |
| Pomegranate powder | Pomegranate (*Punica granatum*) | India | Bark | Taenifuge |
| Quinine (powder or extract) | Quinine (*Chinchona succirubra*) | South America | Bark | Bitter tonic, antimalarial, antipyretic |
| Rosin | Longleaf pine (*Pinus palustris* and other species) | Southeastern North America | Bark | Salves, plasters, ointments |
| Santal Oil | Sandalwood (*Santalum album*) | India, Malaya | Dried heartwood | Perfumery |
| Sassafras (powder and oil) | Sassafras (*Sassafras albidum*) | Eastern United States | Bark of root | Aromatic, stimulant, diaphoretic, flavoring, beverage |
| Slippery Elm powder | Slippery Elm (*Ulmus rubra*) | Eastern United States | Inner bark | Demulcent, emollient |
| Tea | Tea (*Camellia sinensis*) | India, China, Japan | Leaves, leaf buds | Beverage |
| White pine powder | White Pine (*Pinus strobus*) | Eastern North America | Inner bark | Cough syrups |
| Witch-hazel (powder or extract) | Witch-hazel (*Hamamelis virginiana*) | Eastern United States | Leaves and twigs | Astringent, haemostatic |

of paints, in the manufacture of naval stores, and also in *materia medica*. Large quantities are obtained from pine wood, particularly southern kinds. Tannin used in leather manufacture is obtained by extraction from chestnut wood, hemlock bark, the bark and heartwood of quebracho, *Quebracho* sp., of Argentina and Paraguay, and the mangrove, *Rhizophora* sp., found in Florida, the West Indies, Mexico, Central America, and Brazil. Various dyes are obtained from trees. Osage orange furnishes a dye. An important dyewood, *pao brasil,* comes from Brazil, the dye giving a red, yellow, or orange color. Another much-used dye material, haematoxylin, is obtained from the heartwood of *Haematoxylon campechianum,* native and cultivated in tropical America. Catechu or cutch is a dye extracted from the tropical mangrove, *Ceriops* sp. The extract obtained may also be used as a tanning agent.

**Maple Sugar.** The sap of the sugar maple, *Acer saccharum,* contains a considerable amount of sugar with a characteristically delicious flavor that is highly prized and immensely popular. The production of the syrup and sugar is carried on mostly in New England and adjacent Canada, and the states of New York, Pennsylvania, Ohio, Maryland, and the Great Lakes states. The sugar maple tree has the largest amount of sugar in its sap, while the red and silver maple yield about one half the amount. Butternut and the sweet birch are also a source. The sap flows in early spring, generally from about February 15 to April 15. The details of the process are briefly as follows: starch stored in certain tissues of the sapwood the previous year is changed by an enzyme into sugar which then enters in solution into the sap and is transported to the unfolding buds. Part of this can be drawn off without injury to the tree by small tubes or pipes inserted into the sapwood. The sap is collected from various trees and boiled down either to syrup or, further, to sugar.

**Christmas Trees.** The industry amounts to 20-25 million dollars per year, according to whether wholesale or retail prices are figured. The most popular tree is the balsam fir of the northeast, but spruce, red fir, and even pine and redcedar are common and nearly all kinds of conifers are used. The balsam fir and red fir are preferable because they hold their needles longer under house conditions. The Christmas tree trade is profitable. In many parts of the country, plantations have been made for this purpose alone; also plantations designed for future timber yield are thinned to supply Christmas trees. Six to ten years are required to grow a fair-sized tree. A grower of Christmas trees in New York State harvested 600 trees annually from a 15 acre tract and over a 15-year period grossed $7,000 in a combination retail and wholesale business.

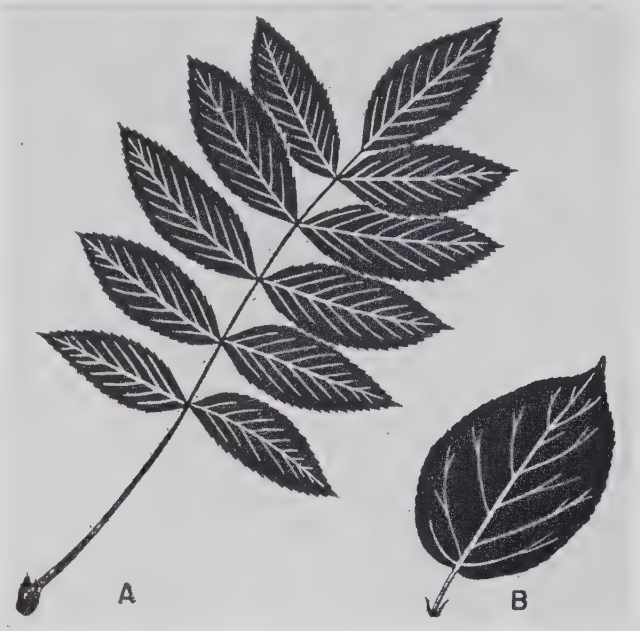
**Cork.** As the branches and trunk of a tree become older, a layer of cork forms in the inner bark which is the product of a cork cambium. The walls of the cork cells are impregnated with a waxy substance called suberin, which renders them impervious to moisture. As the outer bark sloughs off, new layers are formed from deeper cells.

The most important cork in commerce is that of the cork oak of Spain, *Quercus suber,* which produces an excessive amount. Most of the world's supply comes from that country. However, large trees of the cork oak in southern California yield considerable quantities of cork. Plantings are now made annually in 25 states in the warmer parts of the United States. The tree will not endure the cold of the northern parts of the country. Large sheets of cork several inches thick can be stripped from this tree. Trees are stripped every eight to ten years beginning at about the age of 20 years. Such treatment does not injure the tree; on the contrary, there is evidence that it stimulates the cork cambium to new production.

Cork has important industrial uses because of its lightness and the fact that it is air tight and impervious to water. It has been used for many purposes for more than 2,000 years. In addition to the yield of cork, the cork oak produces good crops of edible acorns which in Europe are used as a supplemental stock feed. In Portugal alone, about 200,000 lb. of cork oak acorns are gathered annually.

**Paper.** Since World War II the paper and paper board industry in the United States has annually manufactured products worth about 2.5 billion dollars. Paper of all kinds including newspapers, books, writing tissue, building paper, and paper board for cartons and containers are the main products. The chief raw material is, of course, wood pulp, which together with rosin, a residue in turpentine production, forms more than 80 per cent of all materials involved in paper making. The paper pulp consists almost entirely of the cellulose in wood, the lignin being separated in the chemical treatment. Only small quantities of linen and other cloth rags are now used in paper making, the reverse of conditions 150 years ago when little if any paper was made of wood.

**Rubber.** A tree product which has proved of immense value to man is rubber and although much of the rubber in our automobile tires is now synthetic, natural rubber still



BY PERMISSION FROM "BOTANY: PRINCIPLES AND PROBLEMS," BY SINNOTT & WILSON. COPYRIGHT, 1955, MC GRAW-HILL BOOK COMPANY, INC.

*Simple and compound leaves. (A) Compound leaf with opposite leaflets; (B) simple leaf. Both with serrate margins.*

has a vast multitude of uses. Rubber comes from the milky sap known as latex of a variety of trees, chief of which is *Hevea brasiliensis.* These trees are distributed throughout the whole Amazon region, in Brazil, Colombia, Peru, and Bolivia. Much of our rubber, however, comes from the East Indies now, because large plantations of the Brazilian trees were begun there toward the close of the last century. The world's supply of natural rubber has been derived from these eastern plantations since about 1914. The India rubber fig, *Ficus elastica,* a native of tropical Asia, has a milky latex and was once a source of rubber.

**Chicle.** Another latex product which has attained importance during the last half century is chicle, which forms the base of most of the "chewing gum." It comes from a tree known as the sapodilla, *Achras zapota,* of Central America. In the last prewar year the retail "chewing gum" business amounted to $140,000,000.

**Wax.** The leaf buds of the Brazilian wax palm, *Copernica cerifera,* exude a waxy substance known as carnauba wax, an ingredient of many well-known wax preparations. The South American palm, *Ceroxylon* sp., similarly supplies a palm wax used in pharmaceutical preparations.

**Food.** The nuts and fruits of many trees, too numerous to mention, furnish food for man and for wild life. Prominent among these are Brazil nuts, cashews, coconuts, walnuts, hickory nuts, chestnuts, and fruits such as apples, pears, oranges, lemons, papayas, cherimoyas, and mangoes. Chest-

nuts, for example, have furnished a staple in the Italian diet for centuries. Chestnut flour is used in Italy to make bread. Now, with the chestnut blight threatening to wipe out all European chestnuts, the experiment stations are breeding the tree with more resistant species, as is being done in the United States.

**Medicinals and Flavorings.** A chart is given (*See* p. 658N of some of the important substances used as flavorings or medicinals which are obtained from the leaves, fruit, bark, roots, or wood of various species of trees.

## IDENTIFICATION OF TREES

The identification of trees is based upon their general appearance and the characteristic features of their leaves, bark, winter buds, flowers, and fruit. Trees may be separated into two main groups for ease of identification: (1) the conifers and their relatives which bear cones and have either needle or needle-like leaves or scale-like leaves; (2) the broadleaf trees.

The general appearance or form of a tree such as an oak, maple, linden, or locust is a characteristic feature, and with practice one can recognize the species at a considerable distance by this alone. Familiar examples are young pin oaks with their typical drooping lower branches; tupelo with its peculiar right-angle branching; tulip tree with a tall, erect trunk which often divides at a wide angle. The kind of growth depends primarily upon the position of the buds. A true terminal bud results in an erect trunk as in the pine, spruce, tulip tree, hickory, and maple. A false terminal bud, actually a lateral bud where the apex of the shoot habitually dies, is apt to result in a more spreading branch system, as in the American elm.

The leaves of a tree are most important for use in its identification. Their appearance is generally characteristic of a species. For example, one might compare the leaves of the maple, the elm, and the pine. The needle-type leaves vary mainly in length, thickness, and shape, according to whether they are rounded or flattened along their length. In pines, they grow in clusters, and the number in a cluster is a constant feature for a species. The position of the broad-leaf-type on the stem is important. The leaves may be paired, that is, opposite each other, single and alternately arranged, or single and whorled on the stem. The leaf may be simple or divided into leaflets which may be pinnately arranged, that is, attached along each side of the rachis or axis of the leaf, as in the black locust or palmately arranged, that is, radiating from one central point of the leaf, as in the horse chestnut. The leaves or their leaflets may vary in shape, size, texture, margin, and venation. The venation or system of veins in the leaf is netted in the group known as the dicotyledons such as the maple or oak and parallel in the monocotyledons such as a palm. It is interesting to observe in the gingko, a very primitive relative of the conifers with a broad leaf, that the venation is forked or dichotomous as is usually found in ferns, but never in the more advanced plants. The size of the leaf may vary from the minute scale-leaf of a cypress to the large leaf of a palm tree. The texture of the leaf will vary from smooth to rough, waxy, or hairy. The margins of the leaf may be described as entire (smooth), serrate (sharp-toothed), dentate (large-toothed), and so on. The thickness of the leaf will vary with the species. The leaves may be deciduous (leaves shed every year) or evergreen.

The formation and color of the outer bark are of importance as identifying characters. However, both vary according to the age of the tree; in young stages the outer bark is smooth, and the color may differ from that of older bark. Since there is such variation some study of the bark of the different kinds and ages of trees is necessary. The color of the bark may be striped white and black, gray, white, black, or green depending upon the species of tree.

*Cherry twig in summer condition (A) and winter condition (B). The leaves (and buds) are alternately arranged on the stem.*

The bark may be smooth but usually the segments of outer bark slough off, the shape of the segments depending on the kind of tree. The bark may be flaked, shaggy, ridged, or striped. In the shagbark hickory, the segments are in large plates; in the pignut hickory, in smaller scales. In the hop-hornbeam, the outer bark exfoliates in long, irregular, more or less vertical, ragged strips; in the hornbeam the bark does not exfoliate at all and is smooth, but fluted, showing as it were "muscular ridges." The sycamore sheds its bark in curved segments, showing white patches of inner bark beneath. The London plane, a related species, sheds its

outer bark in a similar way, but the inner bark thus exposed is a greenish-yellow.

The lenticels in the bark (raised dots or horizontal lines, marking openings for gaseous exchange) are a characteristic feature in some species. They are especially prominent in various kinds of cherry and birch.

The winter buds of each species are distinct and vary in size, shape, and in the type of scale covering. Their color varies with the species. The buds may be gray, black, reddish, or green. They are shiny or dull, smooth or hairy. Some trees have embryo flowers and leaves in the same bud; in others there are special flower buds which become a distinguishing feature as in the dogwood.

The flowers of the tree can be good identifying characters for a short period, and likewise the fruit. In some trees, such as the sycamore, the fruits may remain on the tree almost all year round. The cones of the conifers like the fruits of other trees may be used for identification.

On the previous pages are small sketches of the leaves and fruit of some of the most important trees found in North America. Nos. 1-120 are native to North America. They are in two series: Nos. 1-80 are native to the eastern part of the continent, and Nos. 81-120 are native to the western half. The last page of illustrations covers some of the trees originally introduced from foreign lands but now found widely cultivated and as escaped forms in the United States and Canada. *See also* Conifer; Flowering Plants; Forestry; National Forests; Plant Anatomy; Wood.

**TREE CAT.** *See* Paradoxure.

**TREE DUCK,** any one of eight species of duck-like birds of the genus *Dendrocygna,* apparently most nearly related to the geese and swans. They occur in tropical regions around the world and in some parts of the temperate zones. Tree ducks, or whistlers, are characterized by long necks, long legs, and feet that enable them to perch on trees, although few of them ever do this. Their plumage is a combination of browns, grays, chestnut, black, and white. The black-bellied tree duck, *D. autumnalis,* is found in southern Texas, while the fulvous tree duck, *D. bicolor,* occurs in the southwestern states from Louisiana to California.

H. G. De.

**TREE FERN,** a name given to ferns belonging to the tree fern family, Cyatheaceae, native to warm regions in both hemispheres. They have a treelike trunk or caudex, in some species tall and slender, in others rather stout. At the top of the trunk is a rosette of large, graceful, finely cut leaves, sometimes 10 ft. long. They often reach 15 to 30 ft. in height, some species of the genus *Cyathea* exceeding 50 ft. They are a beautiful feature of the tropical vegetation and several are valued as conservatory plants. Among the best-known tree ferns are various species of the genera *Alsophila, Cibotium, Cyathea,* and *Dicksonia.* G. M. Sm.

**TREE MALLOW,** common name for various woody species of *Lavatera,* a genus of the mallow family. The California mallow, *L. assurgentiflora,* is a shrub growing to 15 ft. in height. It has purple flowers about 3 in. across, and is planted in mild climates. *L. arborea,* is native to rocky seacoasts of Europe, and is also cultivated as an ornamental plant because of its purple flowers and fine foliage.

J. C. Wis.

**TREE ORCHID,** *Epidendrum,* a genus of orchids growing on trees in the southeastern United States and in tropical America. There are several hundred species, about eight of which grow in the Florida hammocks and southward along the Keys. One, the green-fly orchid, *E. conopseum,* is found on live oak and magnolia as far north as South Carolina. The North American varieties are generally small, having linear or lanceolate leaves, and white or greenish flowers. In the tropics, the plants attain a larger size and more brilliant coloring, such as *E. vitellinum,* a native of Mexico and Guatemala. This orchid is one of the few species introduced into cultivation. Many other genera of orchids, however, live on trees, such as *Vanda, Dendrobium, Cymbidium,* and *Cattleya.*

J. C. Wis.

**TREE SHREW,** a squirrel-like mammal of the family Tupaiidae, combining anatomical resemblances to both primates and insectivores. The teeth resemble those of certain lemurs, and the eye socket is surrounded by a bony ring. The feet are five-toed and clawed. The muzzle is long and pointed. Tree shrews are diurnal and eat insects, eggs, fruit, and buds. Common tree shrews, *Tupaia,* of India and the Malay region, have bushy tails and are usually brownish or olive-brown. Slender-tailed forms, *Dendrogale,* are found in Indo-China and Borneo, while a similar type, *Urogale,* lives in Mindanao. Another genus, *Ptilocercus,* is characterized by a long tufted tail; it is grayish with a dark facial mask; its teeth are especially primitive. This pentailed tree shrew occurs in Sumatra, Borneo, and Palawan, as well as on the Malay Peninsula. *See also* Insectivore; Primates. J. E. Hi.

**TREE TOAD** or **TREE FROG,** any of the small toad-like or froglike arboreal amphibians belonging to the family Hylidae. They have long legs ending in digits provided with adhesive disks, by which they cling to objects. World-wide in distribution, except for the polar regions, Africa, Madagascar, and Indo-Malaya, the greatest diversity occurs in the tropical forests of South America. Often called "acrobats of the frog world," they delight in long leaps among the tree branches, and sometimes land clinging precariously by one foot. They then pull themselves up and settle into a comfortably concealed position, their colors blending remarkably with those of the tree bark. This body color changes under different conditions, usually becoming darker in cool, moist places. The loud, trilling calls of these amphibians are frequent during damp weather or before storms; hence they are often called weather prophets. They are most active during the evening and at night, when they pursue insects for food. A. Sv.

**TREHALOSE.** *See* Sugar Chemistry (*Oligosaccharides*).

**TREITSCHKE, HEINRICH GOTTHARD VON** [trai'tshkə] (1834-1896), German historian, was born in Dresden, Sept. 15, 1834, the son of a Saxon army officer. He studied at the universities of Leipzig and Bonn, and in 1858 joined the faculty of the University of Leipzig. At about this time Treitschke became an ardent liberal and in 1863 accepted a call to lecture at Freiburg. During the German civil war (1866), he became a Prussian subject and professor at the University of Kiel. He taught also at Heidelberg in 1867, and in 1874 became professor of history at Berlin. In 1871 Treitschke was elected as a National Liberal to the first Reichstag of the German Empire, abandoned the National Liberal party in 1879, and remained a Moderate Conservative member of the Reichstag until 1884. Actually, Treitschke was by now anything but moderate, being anti-Catholic, anti-Semitic, and anti-British. He became the great interpreter of the aggressive Prussian spirit and the expanding power of the Bismarckian empire, overseas as well as in Europe. His most brilliant piece of historical writing was

entitled *Deutsche Geschichte im neunzehnten Jahrhundert* (5 vol., 1879-1894; English translation *German History in the Nineteenth Century,* 7 vol., 1915-1919). Other works of Treitschke's were *Historische und politische Aufsätze* (1865, 1870, 1897); *Zehn Jahre deutscher Kämpfe* (1874; 3rd ed., 1897); and *Politik* (2 vol., 1907). In 1866 he became the editor of the *Preussische Jahrbücher,* and in 1895, upon the death of Heinrich von Sybel, editor of the *Historische Zeitschrift.* Treitschke died in Berlin, Apr. 28, 1896.
R. H. L.

**TRELAWNY, EDWARD JOHN** [trəlɔ'ni] (1792-1881), English adventurer and author, best known through his association with Shelley and Byron, was born in London Nov. 13, 1792, the son of an army officer. After attending naval school, the youth shipped out to India, where, deserting the service, he remained for several years. His friendship with the two poets began in 1822 at Pisa and lasted until their deaths. When Shelley was drowned at sea in July 1822, Trelawny recovered his body and later snatched his heart from the flames during the ceremony of cremation. He accompanied Byron to Greece in 1823, but left him for immediate combat under the Greek insurgent leader, Odysseus Androutsos. During the next decade Trelawny lived in Paris and Florence, was briefly lionized in London, where his romantic connections and his own personality attracted a wide circle, and visited the United States. He was married four times: to an Arabian girl; to Julia Addison, an Englishwoman; to Terzitza Kamenou, sister of Odysseus Androutsos; and in 1847 to Lady Vane Goring. Trelawny's works include his autobiography, *Adventures of a Younger Son* (1831), and his *Recollections of the Last Days of Shelley and Byron* (1858; in 1878 retitled *Records of Shelley, Byron, and the Author*). He died Aug. 13, 1881, at Sompting, near Worthington, West Sussex, England. H. M. J.

**TREMATODA.** *See* Animal Systematics; Flatworms; Flukes.

**TREMOLITE.** *See* Amphibole Group.

**TREMOLO** [trɛ'molo], a term in music always meaning a trembling or fluttering of tone, but produced by different technical means on various instruments.

On violins and other string instruments which are played with a bow two kinds of tremolo are achieved: the bowed tremolo, produced by rapid, up-and-down agitation of the bow on a single note; and the fingered tremolo, a rapid alternation of two different tones produced by the finger on a single string while the bow draws a steady tone from that string.

The vocal tremolo corresponds not to the string tremolo but to the string vibrato; it is a more or less rapid wavering of pitch both above and below the tone nominally being sung. Though often appropriate, when tastefully executed, as a means of "coloring" a straight tone, it is much overdone and is the hallmark of the mediocre singer, who uses it either because he cannot control his vocal chords or else because he wishes to disguise poor tonal quality by this means. The acceptance of this form of tremolo among first-rate singers dates only from the early nineteenth century; the true vocal tremolo, a rapid reiteration of a single tone, was common in earlier periods, but died out, practically speaking, in the eighteenth century. The yodel, it might be noted, is the vocal equivalent of the violinist's fingered tremolo.

On pianos and other keyboard instruments, a rapid alternation of different notes of a chord serves as a tremolo and is almost always found in piano arrangements of orchestral scores to indicate orchestral background. On mandolins, xylophones, balalaikas, drums, and certain other instruments, tremolos, called "rolls" on the drum and produced by rapid reiteration of single tones, act as sustained tones. W. Li.

**TRENCH FEVER.** *See* Rickettsia.

**TRENCH MOUTH.** *See* Mouth Diseases.

**TRENT,** the third longest river in England. Rising on the southwestern slopes of the Pennines and the border of the Cheshire plain, it flows southward to the moorland range and drains the central plains, from Severn Valley to the upland range of Rockingham Forest, in a northeasterly direction. It joins the Yorkshire Ouse to form the Humber, which empties into the North Sea. The Trent is navigable 95 mi. above its junction with the Ouse and is connected by a system of canals to other waterways of middle and western England. Beds of gypsum give its waters a hardness prized by breweries. Burton, Nottingham, and Newark are located on this meandering river. S. Van V.

**TRENT, COUNCIL OF.** *See* Council of Trent.

**TRENT AFFAIR.** *See* Civil War.

**TRENTINO-ALTO ADIGE** [trenti'no ɑ'lto ɑ'dije], formerly Venezia Tridentina, the northernmost region of Italy, which comprises the provinces of Trenton (Trentino) and Bolzano (Alto Adige), having an area of 5,250 sq. mi. It is bounded on the north by Austria, on the west by Switzerland and the region of Lombardy, and on the south by the region of Veneto. The Germans refer to it as the Südtirol.

The region has a certain geographical unity in that it lies almost wholly within the mountainous part of the Adige River watershed. Roughly in the form of a triangle, Trentino-Alto Adige is confined, on the north, by the crest of the Alps; on the east, by the Dolomites; and, to the west, by the massifs of Ortles and Adamello. The southern corner of this triangle extends to the Adige gorge above Verona. The region thus consists entirely of mountains and intermountain valleys. The only areas of level terrain are found in the latter, the largest being at the confluence of the Adige and Isarco valleys near Bolzano.

The Alpine chain marking the northern frontier has a number of peaks exceeding 12,000 ft. in altitude, and is pierced by only two practicable passes: the Brenner and the Resia. The Dolomites are not quite so high but are in several respects even more spectacular. A few glaciers are found in the mountains to the northwest, and much of the terrain everywhere is the result of glacial action.

The Adige River rises near the Resia Pass in the northwest corner of the region and proceeds in a generally easterly direction to Merano, where it turns southward. This upper part of its valley is called the Val Venosta. Near Bolzano, the Isarco joins it, after having picked up the waters of the Rienza (which flows through the Val Pusteria) at Fortezza (Franzensteste). Below Bolzano the principal lateral valleys are those of the Noce and Avisio rivers. The northern tip of Lake Garda and the headwaters of the Mincio basin (Sarca River) lie in the southwest part of the region.

The climate varies widely, depending on altitude and location. The Alpine rampart deflects many of the coldest winds of winter, while in some of the valleys, particularly in those facing south, the springs and autumns are warm and the summers hot. The warm, dry foehn winds are not unknown in the north. Rainfall likewise varies from around 20 in. in the Val Venosta to 28 in. around Bolzano, and over

40 in. in the eastern Alto Adige. In the Dolomites, an annual precipitation of 60 in. is not uncommon.

**The People.** Taken as a whole, the region is predominantly Italian-speaking, while in the Alto Adige all but about 12 per cent are German-speaking. A remnant of a once fairly extensive Latin-speaking element is found in the Dolomites. Illiteracy is practically nonexistent.

About three quarters of the people live in cities and villages, the rest in scattered dwellings. The chief urban centers lie along the trans-Alpine routes up the Adige and over the Resia and Brenner passes: Rovereto (20,758), Trento (62,611), Bolzano (73,652), Merano (25,902), and Bressanone (10,576).

**Economic Life.** The use to which the land in the region is put is indicated by the following percentages: woodlands, 43; pastures and meadows, 33; sown crops, 6; vineyards, orchards, and other such cultivation, 1½; not cultivated or unproductive, 15½. The principal crops, grown mostly in the valleys or on lower slopes, are wheat, corn, rye, potatoes, vegetables, fruits, and hay.

The forests tend to be coniferous in the north and deciduous in the south. The lumber from them is used for, among other things, the making of furniture in several towns of the region. Mineral deposits are varied but not important. Zinc, lead, copper, and iron are found in small quantities, as well as several lesser minerals. During the 1930's, the Fascist government expanded the area's metallurgical industries, notably at Bolzano.

Industrial development was rapid under the impulse of the Italian government after World War I, and was especially notable in chemicals, aluminum, and metal goods. A few textile plants are found here and there; and, in the mountain valleys, some of the ancient handicrafts survive.

Water power is abundant and is increasingly being harnessed to produce electricity for the railways, for industrial use, and for domestic consumption. The tourist industry, one of the region's economic mainstays, caters annually to several hundred thousand visitors. There are a number of mountain roads famous for their beauty, and the region is served by the main railway line from Italy through the Brenner Pass to Germany, and by several branches.

R. G. W.

**TRENTO** [tre'nto], the name of a provincial capital, known in English as Trent, and a province, in northern Italy.

**The City.** The city of Trento is situated in a narrow plain along the east bank of the Adige River at an elevation of 605 ft. above sea level and thus lies along the historically famous route from Italy to Germany across the Alps via the Brenner Pass.

Trento is surrounded by massive peaks of the Dolomite and Alpine chains, some of them exceeding 7,000 ft. in elevation. The climate is generally moderate, but with cool winters. The average rainfall is over 40 in. In addition to its function as a regional market place and administrative center, the city has a number of small industries: textiles, cement, chemicals, flour, and wines.

In pre-Roman times the area around Trento was occupied successively by Ligurians, Illyrians, Etruscans, and Celts. The city, known to the Romans as Tridentum, was conquered by them in 222 B.C. and in time became a great military post. The Lombards made it the seat of their northernmost duchy, but during later Germanic invasions it suffered badly. After the Carolingian epoch it was for a time part of the March of Verona and in 952 was added to the German kingdom as a strongpoint guarding the southern approaches

EWING GALLOWAY

*CASTELLO DEL BUON CONSIGLIO, TRENTO*

to the Brenner. Trento also became the seat of an ecclesiastical principality, but it remained closely allied to the imperial cause in the investiture struggle. After resisting Ghibelline attempts to conquer it, Trento came under Hapsburg rule with the end of the temporal power of the bishops in 1363.

Being on the border line between the Italian and German cultures, Trento was pulled both to the north and south in its interests and loyalties, and partly for this reason Trento was the site of the great Church council which met off and on from 1545 to 1563 to conjure the Protestant danger.

Napoleon took Trento in 1796, and French forces entered it again in 1797, 1801, and 1809. The region was the scene of a revolt by the Tirolese population against French rule. In 1810 it became the capital of the French department of the Alto Adige, but in 1814 it returned to the Hapsburg control. As a fundamentally Italian city, Trento became a center of Irredentist agitation after the creation of United Italy. Although briefly evacuated by the Austrian army in the war of 1866, it was not united with Italy until after World War I. During the period preceding that conflict the Austrians heavily fortified the city, and it was not entered by Italian troops until Nov. 3, 1918. Trento was bombed in World War II because of its position along the vital rail line to the Brenner Pass. Pop. (off. est. 1947), 62,611.

**The Province.** The province of Trento, comprising 127 communes, has an area of 2,516 sq. mi. Except for the narrow valleys of the Adige River and a few of its larger tributaries, the province consists of mountainous terrain, rising in the northeast to over 10,000 ft. in the Dolomites and to a similar height in the Adamello Massif to the west. The principal agricultural products are grapes, wheat, corn, hay, fruit, and cattle.

The hydroelectric industry is highly developed in Trento. Secondary industries include cement, textiles, printing, and furniture. Aluminum and iron are mined, and marble is quarried. The tourist industry is normally one of the leading sources of income. A great deal of rebuilding had to be done during the early years of Italian rule as a result of the vast damage wrought in World War I. Pop. (off. est. 1947), 405,000.

R. G. W.

**TRENTON,** a town in Pictou Co., Nova Scotia, Canada, situated on the bank of the East River of Pictou Harbour, 105 mi. northeast of Halifax. The Canadian National Railways provide transportation. The industrial activities center in the steel rolling mills and railway shops. The town was incorporated in 1911. Pop. 1951, 3,089.

D. F. P.

**TRENTON,** a town and port in Hastings Co., Ontario, Canada, at the mouth of the Trent River on the picturesque Bay of Quinte, an arm of Lake Ontario, 100 mi. northeast of Toronto, on Provincial Highway 2. The Canadian National and Canadian Pacific railways furnish transportation. It is the southern terminus of the Trent Canal System while the Murray Canal, through the narrow isthmus at Carrying Place, gives Trenton direct access to Lake Ontario. Manufactures include canned goods, cottons, paper, and silverware. Pop. 1951, 10,085. D. F. P.

**TRENTON,** a village in Wayne Co., in southeastern Michigan, situated on the Detroit River, about 14 mi. south of Detroit. This industrial community, chartered in 1875, has freight transportation provided by the New York Central, the Detroit and Toledo Shore Line, and the Detroit, Toledo and Ironton railroads. Distilled alcohol and chemicals derived from the limestone quarried in the immediate vicinity are the chief industrial products. There is a large electric power plant in Trenton. Pop. 1950, 6,222.

**TRENTON,** a city in northern Missouri, the county seat of Grundy Co., situated 75 mi. northeast of Kansas City. Coal mines and rock quarries are near by, but the region is chiefly agricultural and devoted to dairy, grain, and poultry farms and stock raising. Trenton was settled in 1834 and was first known as Bluff Grove or Lomax's Store. It was platted in 1841. Trenton, the seat of a junior college, is administered by a mayor and council. Crowder Memorial State Park, named for Maj. Gen. Enoch H. Crowder, deviser of the selective service act of World War I, is 4½ mi. northwest. Trenton is served by the Chicago, Rock Island & Pacific Railway. Local industrial plants include railroad machine shops, bottling works, a cannery, a creamery, and hatcheries. Pop. 1950, 6,157.

**TRENTON,** the capital city of New Jersey, the county seat of Mercer Co., in west central New Jersey, situated at the head of tidewater navigation of the Delaware River, 48 mi. southwest of Newark and 30 mi. northeast of Philadelphia, Pa. The first white settler on the site was Mahlon Stacy, an English Quaker, who took up a grant of land in 1679 and built a log mill and a house, around which a small community formed. In 1714 William Trent, a Philadelphia merchant, bought a large portion of the Stacy property, and he backed the settlement's development. The house which he built in 1719 is the city's oldest standing home. The village became known as Trent's Town, and its position at the head of sloop navigation made it a shipping point for the area's produce and a depot for merchandise between Philadelphia and New York City. Ferry service, chartered in 1727, afforded communication with Pennsylvania, and it was one of the chief stopping places on King's Highway in Colonial times. During the French and Indian War royal troops were quartered in the town. Occupied alternately by Colonial and Hessian forces, Trenton was the scene of one of the most important and decisive battles of the Revolutionary War. In 1784 Congress convened in Trenton and decided to make it the country's capital, but this motion was defeated in the following year. Selected as the state capital in 1790, Trenton was incorporated as a city in 1792. In 1794 the Federal Government was located temporarily in the city. Communication with Pennsylvania, particularly Philadelphia, was facilitated with the completion of a bridge across the Delaware in 1804. The city has the commission form of local government.

There are many historical landmarks in the city, including the Old Barracks, quarters of troops in the French and Indian War and of Hessian troops in the Revolutionary War; Douglass House, where Washington planned the second battle of Trenton; Old Masonic Temple, built in 1793; the Battle Monument, marking the spot where the Continentals first fired on the Hessians; the Old Friends Meeting House, built in 1739, in whose grounds is buried George Clymer, a signer of the Declaration of Independence and the Constitution; and the park a few miles northwest of the city commemorating Washington's crossing of the Delaware. Other sites of interest include the Soldiers' and Sailors' War Memorial, the City Hall, the Statehouse, the state museum, and Trenton Municipal Colony, a municipal welfare institution. Trenton is the seat of a state teachers' college, Rider College, a state asylum, a state penitentiary, a state school for girls, and a state school for the deaf. It was the home of John and Washington Roebling, famous bridge engineers.

Transportation facilities are furnished by the Pennsylvania and Reading railroads and by coastwise and ocean-going steamers. In Colonial days local residents made potteries from the clay in the region, but it was not until after 1850 when craftsmen were brought over from England and Ireland that the industry developed extensively. Trenton is widely known as a production center for some of the nation's finest chinaware, as well as various other potteries and ceramics. Trenton's industrial output includes wire and cable, soft and hard rubber goods, steam turbines, automobile accessories, cigars, structural steel, asbestos, clothing, dies, metal products, canned goods, textiles, and aviation supplies. The cable equipment used in the construction of the Brooklyn, Golden Gate, and San Francisco Bay bridges was produced in Trenton. Pop. 1950, 128,009. S. D. M.

**TRENTON, BATTLE OF,** Dec. 26, 1776, an important American victory in the Revolutionary War. Following the loss of New York City in September 1776 and the subsequent battle of White Plains, General George Washington retreated across New Jersey. Harried by the pursuing British and losing almost three fourths of his army because of illness or desertions, he managed to transport his Continental troops across the Delaware River into Pennsylvania in December. His commandeering of all boats for some distance up and down the river stalled the British on the east bank, and the enemy went into winter quarters. Facing the loss of many of his remaining troops, whose enlistments were to expire at the end of the year, and knowing that Philadelphia was in danger, Washington planned a bold move. Scouting reports told him that Hessian troops billeted in Trenton were scattered and practically without defenses. Despite a bitter storm, Washington crossed the Delaware on Christmas night. One segment of his command, ordered to strike the Hessian troops at Bordentown, south of Trenton, was too late to be effective, and another group, to the north, failed to make the crossing. The third force, under Washington, succeeded in reaching the Jersey shore north of the city. The Americans quickly penetrated the picket lines and advanced through the city, taking the Hessians almost completely by surprise in the early hours of December 26. The mercenaries resisted briefly but, with their retreat cut off, soon surrendered. The Americans returned to Pennsylvania with almost 1,000 prisoners and great quantities of arms and stores. The victory gave new life to the American cause, and led to the successful battle of Princeton and the eventual withdrawal of the British from New Jersey. M. Je.

**TREPAK** [trɛpɑ′k], a Russian dance in brisk duple meter performed by Cossacks. A famous example is to be found in Tchaikovsky's *Nutcracker Suite.* P. N.

**TRESPASS,** in law, a term which, in its more comprehensive sense, is defined as any misfeasance or act whereby another is injuriously treated or damaged. The term has also been defined as an unlawful act committed with violence, actual or implied, to the person, property, or rights of another, or any unauthorized entry upon the real estate of another. However, in the nomenclature of the common law, an act of injury has been generally deemed a trespass only if the damage was directly and immediately occasioned by such act; if, on the other hand, the act of injury merely created a condition later responsible for harm to another, it has been referred to, in distinction, as a "trespass on the case." Actionable negligence is generally deemed a trespass only if the act complained of is affirmative in nature, and not merely a negligent omission to perform a duty.

In its modern, restricted, and ordinary sense, on the other hand, trespass is simply an entry on land without lawful authority, giving rise to an action for damages, in which, if the act of trespass has been committed maliciously, or under other aggravating circumstances, exemplary damages may be recoverable.

The various forms of common-law trespass to the person or to personal property are now generally grouped separately for the purpose of identification and treatment, under such legal headings, for example, as "Assault and Battery," "False Imprisonment," "Negligence," and "Conversion." H. Si.

**TREVELYAN, GEORGE MACAULAY** [trɪvɛ′lyən] (1876- ), English historian, was born on Feb. 16, 1876, and educated at Harrow and Trinity College, Cambridge. From 1915 to 1918 he commanded the first British ambulance unit sent to Italy in World War I. In 1927 he was appointed Regius Professor of Modern History at Cambridge, a position from which he resigned when he became Master of Trinity College, Cambridge, in 1940. He received the Order of Merit in 1930 and became a Fellow of the British Academy. His historical works are written with literary brilliance and sound scholarship; the most important are *England in the Age of Wycliffe* (1899), *England under the Stuarts* (1907), *Garibaldi's Defense of the Roman Republic* (1907), *Garibaldi and the Thousand* (1909), *Garibaldi and the Making of Italy* (1911), *Life of John Bright* (1917), *Lord Grey of the Reform Bill* (1920), *British History in the Nineteenth Century, 1782-1901* (1922), *Manin and the Venetian Revolution of 1848* (1923), *England under Queen Anne* (3 vols., 1930-1934), and *English Social History* (1944). He also wrote *An Autobiography* (1949). E. R. A.

**TREVELYAN, SIR GEORGE OTTO** (1838-1928), English historian, was born in Rothley Temple, Leicestershire, July 20, 1838. Educated at Harrow and Trinity College, Cambridge, he went to India in 1862 as secretary to his father, Sir Charles Trevelyan, then financial member of the Council of Calcutta. In 1865 he was elected to the House of Commons, where he sat as a member from 1868 to 1897. From 1868 to 1870 he was a Civil Lord of the Admiralty, from 1880 to 1882 Secretary to the Admiralty, and from 1882 to 1884 Chief Secretary for Ireland. He was Secretary for Scotland in 1886 and again in 1892. In 1911 he was awarded the Order of Merit. His first work of importance was *The Life and Letters of Lord Macaulay* (1876), an excellent biography of his uncle; other works that merit attention are *The Early History of Charles James Fox* (1880), *The American Revolution* (4 vols., 1909), and *George III and Charles Fox* (2 vols., 1912-1914). Trevelyan wrote history from the Whig point of view, however, and his work on the American Revolution has been the object of considerable criticism. He died Aug. 17, 1928, at Wallington, Northumberland. E. R.A.

**TRÈVES.** *See* TRIER.

**TREVISO** [trevi′zo], a province and also the capital city of the province, in an agricultural region, in the central part of the region of Veneto, in northeastern Italy.

**The City.** Treviso is situated astride the Sile River in the Venetian Plain about halfway between the mountains and the sea, at 45° 40′ N. lat. and 12° 15′ E. long., at an elevation of 50 ft. above the level of the Adriatic. The climate is characterized by hot summers and temperate winters, with the rainy season coming in the spring and summer. Treviso is a market place for the fertile farming region in which it lies and also possesses several industrial establishments, including flour mills, potteries, cement and fertilizer plants, paper factories, and machine shops. It is an important railway center, with lines running to Venice, Udine, Belluno, Vicenza, and Milan. The older part of town is enclosed within three miles of walls built early in the sixteenth century and in part protected by moats; some of the latter have been filled in to form parks. This part of the city is traversed by several canals and in general has a medieval atmosphere, with narrow, crooked streets and old buildings. The newer quarters, outside the walls, are modern and spacious. The principal monuments include the Palazzo Provinziale, the Palazzo dei Trecento (1207, Romanesque), a cathedral and its baptistery, and the churches of Sant' Agostino (eighteenth century) and San Niccolò (thirteenth century Gothic). Treviso, Roman Tarvisium, became the seat of a duchy under the Lombards. Later the bishop acquired power but in turn was finally deprived of political functions in the early thirteenth century by the expanding commune. The latter, however, fell prey to a succession of *signori,* concluding with the La Scala family who ceded Treviso to Venice in 1339. With brief interludes, Venetian rule lasted until the end of the republic in 1797. During the late Middle Ages and early modern period the city was a minor center of art and learning. After the Napoleonic Era it passed to Austria and remained under Hapsburg dominion until 1866. During World War I Treviso became the headquarters of the Italian army after the disaster at Caporetto in the fall of 1917. It suffered considerably from enemy action. Pop. (off. est. 1947), 63,067 (including suburbs).

**The Province.** The province of Treviso, comprising 90 communes, has an area of 956 sq. mi. Seven tenths of the territory is on the Venetian Plain and the remainder in the foothills of the Dolomites. The province does not quite reach to the Adriatic. It is drained chiefly by the Piave, Livenza, Sile, and Zero rivers. Agriculture and animal husbandry are the leading activities. Practically all of the arable land is cultivated, and much of it is irrigated by an extensive system of canals and ditches. The principal products are wheat, corn, hay, grapes, fruit, flax, sugar beets, vegetables, and tobacco. Cattle and swine are raised in large numbers, while the province is noted in Italy for the production of silk cocoons. Besides Treviso, other important centers are Vittorio Veneto, site of the Italian victory over the Austrian army at the end of World War I (Oct. 24 to Nov. 3, 1918); and Conegliano. Pop. (off. est. 1947), 618,000. R. G. W.

**TRIAD** [trai'æd], in music, a chord of three notes built up by intervals of thirds, as C-E-G. The note C is known as the root or fundamental of this triad. Hence when C is in the bass, the triad is said to be in root (fundamental) position; when E, in first inversion; when G, in second inversion. Triads are classified according to their intervals as major, minor, diminished, and augmented. A major triad contains a major third and a perfect fifth, as C-E-G; a minor triad, a minor third and a perfect fifth, as C-E♭-G; a diminished triad, a minor third and a diminished fifth, as C-E♭-G♭; an augmented triad, a major third and an augmented fifth, as C-E-G♯. J. M. Ba.

**TRIAL.** *See* Legal Procedure.

**TRIANGLE.** *See* Geometry; Trigonometry.

**TRIANGLE,** an instrument used in Occidental music since the fifteenth century. Originally it had a trapezoidal shape, but from the seventeenth century onward it has consisted of a thin steel rod bent into triangular form, suspended by a cord and struck with a small metal beater. After several centuries of diversified use, it was introduced into the eighteenth-century orchestra as a coloristic effect, chiefly in imitation of the stick-rattle characteristic of Turkish military music. During the nineteenth century the triangle lost its coloristic connotations and became an ordinary member of the orchestra's percussion section. W. Li.

**TRIANGULUM** [traiæ'ŋgyuləm], the Triangle, an ancient northern constellation, between Andromeda and Aries. Its only noticeable asterism is a small right triangle of three stars of third and fourth magnitude. Its other stars, which are dimmer, include many interesting double stars. The large spiral galaxy M 33, near the western boundary, is one of the nearer extragalactic nebulae, so called because it is beyond the Milky Way. It is around 720,000 light-years distant from the earth. J. H. P.

**TRIANGULUM AUSTRALE** [ɔstre'li], the Southern Triangle, a small constellation centered at approximately right ascension, 16 hr.; declination, —65°. The triangular figure is conspicuous, since three stars of the second and third magnitudes mark the angles. The remaining stars are faint. The constellation cannot be seen north of the latitude of New Orleans. J. H. P.

**TRIASSIC PERIOD.** *See* Geology.

**TRIBES OF ISRAEL, TWELVE.** In Biblical tradition the ancient Hebrews, descended from Jacob (or Israel), were divided into twelve tribes, bearing the names of Jacob's sons, except in the case of the tribes of Manasseh and Ephraim: these represented the descendants of Jacob's son Joseph and bore the names of Joseph's two sons. The descendants of Jacob's son Levi are not included in the count of twelve, for the tribe of Levi, devoted to the service of the Lord, had no territory in Canaan and lived scattered throughout the land. A common arrangement in lists of the tribes is according to their maternal descent, as follows: Leah tribes: Reuben, Simeon, Levi, Judah, Issachar, Zebulun; Zilpah tribes: Gad, Asher; Rachel tribes: Ephraim and Manasseh, Benjamin; Bilhah tribes: Dan, Naphtali.

The tribe was composed of a group of families, united by a blood tie and constituting a social and political unit. As time went on, the stronger tribes tended to absorb the weaker ones. After the establishment of the monarchy the tribes ceased to function independently and largely lost their individual identity, but the concept of twelve tribes of Israel persisted and occurs in relatively late Hebrew literature.

The modern critical view of the Israelite tribes differs considerably from the traditional. In the critical view the ancient Hebrew nation was formed by a confederation of originally nomadic tribes who entered Canaan at different times, though probably in groups of several tribes at a time; it is considered highly improbable that these tribes were descended from one man (Jacob). M. A. G.

**TRIBUNE,** a Roman official. The tribuneship at Rome originated in the struggle between the patricians and plebeians during the early republican period. The board of ten tribunes was annually elected by the plebeians to provide a group of officials which would be devoted to the interests of the people. The tribune had the power to veto any act of a Roman magistrate or to halt the proceedings of the senate. The tribune himself was sacrosanct; to disobey him was an offense punishable by death. Although they were unable to exercise military command or any considerable judicial power, the tribunes could call meetings of the *comitia tributa* and the senate and suggest legislative action to be taken by those bodies. T. B. J.

**TRICHINA** [trɪkai'nə], *Trichinella spiralis,* a true nematode round worm of the phylum Nemathelminthes. It is the cause of human trichinosis, a disease widely distributed in various parts of the world. It is estimated that there are about 20,000,000 persons affected in the United States. The infection is established by eating raw or improperly cooked pork containing the cysts of the larvae. The cysts are digested in the stomach, releasing the larvae, which migrate to the intestine where they become sexually mature. The females are viviparous, and a single worm may deposit as many as 1,800 progeny in about six weeks. The young parasites find their way into the lymphatics and venules and are distributed to various parts of the body, eventually encapsulating (encysting) in the muscles, especially the diaphragm, tongue, and chest muscles. The spiral form taken by the worms in muscle is responsible for the specific name *spiralis.* After a period of several months the host deposits calcium around the encysted worms. This process is called calcification. It is estimated that, in a man, five worms for every gram of body weight can produce death. The pathological lesions result from mechanical and toxic irritations produced by the worms during the invasion, migration, and encystations. Worms often invade the heart muscles causing myocarditis. Those in the diaphragm interfere with the proper function of this important respiratory organ. No effective treatment is known. The best preventive measures are the proper inspection of pork and its thorough cooking. R. F. N.

**TRICHINOPOLY** or (officially) **TIRUCHIRAPALLI** [trɪ'tshɪnɒ'pəli; tɪru'tshɪrʌpʌ'], an important city in southeastern India. It is located in Madras State at the head of the delta of the Cauvery River. The fertile alluvial soil and the warm to hot climate make the region an excellent one for agriculture. The rainfall averages 40 in. a year, most of it falling during October, November, and December; during the rest of the year Trichinopoly is hot and dry, and, because of this, agriculture is largely dependent upon the irrigation provided by the Mettur Dam and Irrigation Project. Rice, millet, cotton, grain sorghum, peanuts, sugar cane, and tobacco are grown in the densely settled Trichinopoly district, and the city of Trichinopoly serves as the market and

administrative center. The city is an important railway junction and educational and industrial center, well known for cigar manufacturing and silk weaving. A 273-ft. rock in the center of the city has a Siva temple at its base and a Ganesa temple at its summit, which affords a panoramic view of the surrounding region. Pop. 1951, 218,921.

J. E. F.

**TRICHOMONIASIS.** *See* PROTOZOA (*Diseases*).

**TRICHOPTERA** [trɪkɒ′ptərə], the scientific name of the order of insects commonly known as caddice flies or caddis worms. In the larval stage, they are aquatic, and most of them build cases in which they travel about. The larvae of some species construct web nets in which they catch their food. Many of the adults resemble moths but they can be distinguished by the presence of hairs rather than scales on the wings. *See also* CADDICE FLY.

C.H. Cu.

**TRIER** [tri′r] (*Fr.* Trèves), a commercial and historic town in the state (*Land*) of Rhineland-Palatinate, in the (West) German Federal Republic, 6 mi. east of the Luxembourg frontier and about 55 mi. southwest of Koblenz. The town lies on the Moselle River, in a valley amid vine-clad hillsides with the Hunsrück Mountains in the background. Reputed to be Germany's oldest city, Trier was capital of the Treviri, a tribe of Belgic Gauls that was conquered in 56 B.C. by Julius Caesar. It then became the Roman colony Augusta Trevirorum, later the capital of the province of Gallia Belgica. Trier was made a bishopric in 328 and became an archbishopric in the ninth century. Medieval Trier was an important crossroads trading center and a seat of monastic scholarship. Clemens Wenceslaus, the last elector and a Saxon prince, transferred his residence to Koblenz in 1786. Karl Marx was born in Trier in 1818. From 1918 to 1923 United States troops occupied the town. In World War II the town not only was heavily bombed but also received intensive artillery shelling, resulting in severe damage and destruction. After the war Trier was included in the French zone of occupation. Prior to 1942 there were many fine old buildings and Roman remains, but few escaped damage. The old cathedral, which was begun before the fourth century as a Roman basilica and was extended during the next thousand years, was ruined. The Church of Our Lady, connected with the cathedral by cloisters, is said to have been the first Gothic church in Germany; it was largely ruined. The quaint Market Place, with the fifteenth-century Rotes Haus, was devastated. The Abbey of St. Matthew was severely damaged. Among the noteworthy Roman remains are included the fourth-century Basilica; the third-century amphitheatre; the Porta Nigra, a fortified gate predating the fourth century and the finest Roman structure remaining in Germany; and the Roman Baths. Trier is the head of barge navigation on the Moselle, which, however, is not greatly utilized because of its numerous turns and windings. The town is famous for its trade in Moselle and Saar wines and is a rail junction. Prewar industries included leather-goods factories, breweries, rolling mills, and champagne cellars. Pop. 1953, 83,700.

C. C. H.

**TRIESTE** [triɛ′ste; triɛ′st], a city and province of the region of Friuli-Venezia Giulia, in northeast Italy. The province is located on the eastern and southern shores of the Gulf of Trieste, at the head of the Adriatic Sea, and is bounded on the north by the province of Gorizia and on the east and south by the Republic of Slovenia in Yugoslavia. Between February 1947 and October 1954, the province, including the city of Trieste, constituted the northern portion of the Free Territory of Trieste, established by a peace treaty between Italy and the Allies at the end of World War II. This Free Territory, with an area of about 285 sq. mi., was located on the northwest side of the Istrian Peninsula. Of its population of about 350,000, almost 300,000 were Italian, and the great majority of these lived in the commune of Trieste; most of the rural inhabitants were Slovenes.

**The City.** The port city of Trieste lies on the northernmost extension of a belt of sandstone hills that slopes steeply from the Carso Plateau (elevation about 1,300 ft.) down to the sea. In general, the city has a modern appearance, with most of the old city at the base of the hill of San Giusto.

Small valleys, some of them suitable for farming, are interspersed among the rocky hills, but 95 per cent of the food consumed in this zone must be imported. The climate is generally moderate, though July and August may be uncomfortably hot. The temperature seldom goes below freezing, but a severe northeast wind, the *bora,* blows in winter and sometimes attains a velocity of over 100 mph.

Trieste is a natural port for landlocked Austria, Czechoslovakia, and Hungary, as well as for the adjacent areas of Italy and Yugoslavia. Damage resulting from World War II was extensive, however, and the shipping industry was particularly affected. Furthermore, the decline in intra-European trade and the Cold War meant a great reduction in the city's commercial activity. During the period of the Free Territory, Trieste, with its principal economic and political ties either cut or restricted, was unable to balance its economy through commercial and industrial enterprises, essential to a city lacking resources.

Shipbuilding is a principal industry in Trieste; other establishments include oil refineries, canneries, iron and steel works, silk plants, and paper works. In the region southwest of the city bauxite is mined, and marble and limestone are also quarried. Family artisans produce various commodities in substantial quantities. In the province most of the cultivated area is occupied by orchards and vineyards, and fishing is important.

The principal exports are ships, petroleum products, vegetable oils and their by-products, and semifinished iron and steel products; most exports go to Italy. The main imports are foodstuffs, coal, crude oil, and industrial raw materials. The province has over 550 mi. of highway and over 60 mi. of railroad, and Trieste is on the Simplon-Orient Express route.

Since its liberation in 1945, Trieste received continual relief, primarily from the United States, though Italy and the United Kingdom also made substantial contributions. Economically, Trieste is unable to survive without aid under present world conditions.

**History.** Founded by the Carnic Gauls, Trieste became the Roman colony of Tergeste in the first century before Christ. Later, the city was held by the Byzantine Empire, except for brief periods of Gothic and Lombard rule, until Charlemagne took it in 787. In 948, King Lothair II granted it independence, and Trieste remained free until its capture by Venice in 1202; in 1382, it was taken by the Hapsburgs. Trieste's basis as one of the great ports of the world was laid by Charles VI, who proclaimed Trieste a free port in 1719 and proceeded to make it the principal sea outlet for his empire. Both the city and its trade suffered during the Napoleonic Era, but after the return of the city to Austria in 1813, the economic importance of Trieste grew with the increase of trade in central Europe. Meantime, Aus-

trian political repression in Trieste had the effect of encouraging liberal and Italian national movements, and in the 1860's Austria began to encourage the entry of Slavic and other non-Italian elements into the area in an effort to offset the predominantly Italian native population. Nevertheless, Trieste remained Italian in allegiance, and at the end of World War I it was occupied by Italian troops; it was awarded to Italy in 1920. Toward the end of World War II, Trieste was occupied by German troops, but in 1945 it was liberated by the forces of Marshal Tito and by those of the United Kingdom and the United States.

At the close of World War II, Yugoslavia wished to annex Trieste, but since Yugoslavia had strong ties with the Soviet Union at this time, the British and American governments sought to uphold a balance of power by supporting the Italian claims. Allied representatives suggested frontiers corresponding to the boundary between Italian and Slavic populations, but there appeared to be no geographical separation of the ethnic elements, and any attempted solution seemed bound to arouse some dissatisfaction in the Territory. The Free Territory of Trieste was constituted by the Italian Peace Treaty as a compromise between the conflicting interests of the Western powers and Soviet Russia, and without regard to the disposition and wishes of the population. Under the terms of the treaty, Trieste was to be a free port, and the city and surrounding area were to become a free, independent territory under a Governor General to be appointed by the United Nations Security Council as its representative. Pending the appointment of a governor, on which the Security Council could not agree, the territory was occupied by the British and United States forces (zone A), and Yugoslavian forces (zone B). During the next year, the British and United States governments asserted that Yugoslavia was virtually incorporating its zone of occupation into the mother country, while the Yugoslavian government claimed that the United Kingdom-United States authorities were planning the ultimate union of the zone with Italy. On Mar. 20, 1948, the governments of the United States, the United Kingdom, and France declared Trieste's right to be returned to Italy. The Soviet Union opposed the return and nothing was done to implement it. The subsequent break between Marshal Tito of Yugoslavia and Stalin dampened the Allied enthusiasm for the return of Trieste to Italy.

The British and American governments, eager to be relieved of their responsibility, made a number of steps toward the eventual integration of the zone into Italy and, on May 9, 1952, they provided for the appointment of an Italian political adviser to the commander of the zone, and the civil administration, except in police matters, was Italian. This move was protested by the Soviet Union and, independently, by Yugoslavia, which then proceeded to make its zone virtually part of Yugoslavia.

On May 25, 1952, elections were held in the United Kingdom-United States zone of Trieste. An Italian coalition group favoring the government of De Gasperi was elected.

On Oct. 8, 1953, the United States and Great Britain announced their decision to withdraw their troops from Zone A and turn over that administration to the Italian government. Yugoslavia protested and the decision was withdrawn pending a settlement acceptable to Yugoslavia.

By May 1954, after negotiating separately with Italian and Yugoslav representatives, British and American diplomats reached a tentative agreement with the Yugoslavs on the main points of a settlement plan to be submitted to Italy. The agreement was formally initialed by the Italian and Yugoslav ambassadors in London on October 5. It provided for a *de facto* partition of the Free Territory, with Trieste and most of Zone A coming under Italian administration, while Yugoslavia received Zone B and a small strip of Zone A extending over an area of about 9 sq. mi. and inhabited by over 3,000 people, mostly Slovene. Italy got an area of 86 sq. mi. with a population of about 300,000, predominantly Italian and mostly living in the city of Trieste (pop. c. 280,000); Yugoslavia received an area of over 200 sq. mi. with a population of about 75,000, almost two thirds of them Italian. Trieste was to be maintained as a free port. S. J. H.

**TRIFOLIUM.** *See* Clover.

**TRIFORIUM.** *See* Architectural Terms.

**TRIGGERFISH,** *Balistes carolinensis,* a small, compressed fish of a tropical family, the Balistidae. It is distributed from the Dutch West Indies northward to Nova Scotia but is most common in the South. The triggerfish is named for the peculiar-looking arrangement found in the three spines of the first dorsal fin that are set in a trough. Once erected, the first and second spines cannot be forcibly depressed by external pressure. However, if the third spine or trigger is depressed the others fold automatically. The triggerfish reaches a length of about twelve inches. Several other species, including the brilliantly colored queen triggerfish, *B. vetula,* occur along the south Atlantic coast. The famous humuhumu-nukunuku-apaa of Hawaii, which is sometimes poisonous, owing to the occasional presence of an alkaloid, belongs to this group. E. C. R.

**TRIGLYPH.** *See* Architectural Terms.

**TRIGONOMETRY** [trĭ'gŏnd'mĭtri] (*trigonon,* triangle +*metron,* a measure), that branch of mathematics concerned with the measurement of lengths and angles. This aspect of the subject differs from geometry mainly in its use of the methods of algebra, and in the fact that its principal goal is to yield numerical answers. A given angle is usually expressed in terms of the ratios of the sides of a right triangle which contains the angle. Trigonometry also investigates the relationship and behavior of these ratios. This phase of the science bears little resemblance to geometry, forming part of the theory of functions.

**Historical.** The first significant contributions to the subject were made by the Greeks, mainly in conjunction with their astronomical investigations. Hipparchus of Nicaea (c. 140 B.C.), a mathematician and astronomer, was the first to make systematic use of trigonometry, and is regarded as its founder. He wrote a treatise on the calculations of chords of angles, and there is evidence that he made use of relationships similar to some of those in modern trigonometry. Menelaus of Alexandria (c. 100 B.C.) made many contributions to spherical trigonometry, which was being developed faster than plane trigonometry because of its important role in astronomy. The work of these men was continued by Ptolemy of Alexandria (c. A.D. 125), whose great work, the *Almagest,* exerted a profound influence on astronomy and trigonometry for a thousand years.

After Ptolemy, the science passed to mathematicians of the East, principally the Hindus and Arabs. They constructed tables of half-chords which are equivalent to sines, introduced the idea of tangent and cotangent, discovered many new theorems, and after ten centuries transmitted their knowledge back to Europe.

The subject was revived in the West during the fifteenth

century, chiefly through the efforts of Georg von Purbach (1423-1461) and his pupil Johann Müller (Regiomontanus) (1436-1476). The latter translated the Almagest, made many original contributions, and for the first time treated trigonometry as a subject independent of astronomy.

The methods of analysis were applied to trigonometry largely by John Bernoulli (1667-1748), Abraham de Moivre (1667-1754), and Leonhard Euler (1707-1783).

## PLANE TRIGONOMETRY

**The Angle.** If two straight lines are drawn at right angles to each other, they divide the plane into four regions, called quadrants. These are usually numbered in a counterclockwise direction, as in Fig. 1. An angle may be thought of as swept out, or generated, when line $OX$ revolves about point $O$. The counterclockwise direction is generally taken as positive. A complete revolution of $OX$ is equivalent to an angle of 360 degrees. Each degree is divided into 60 minutes, and each minute further subdivided into 60 seconds. Another useful unit of angle is the radian. It is the angle subtended by a circular arc equal in length to the radius. $2\pi$ radians $= 360°$, or 1 radian is equal very nearly to $57°\ 17'\ 45''$.

**The Right Triangle.** Etymologically the word trigonometry means the science of the measurement of triangles. Today this description is no longer all-inclusive. However, the right triangle is of particular importance, since, first, certain ratios basic to the subject are defined in terms of the sides of right triangles, and, secondly, complicated plane figures may be dissected into right triangles and analyzed in terms of these ratios.

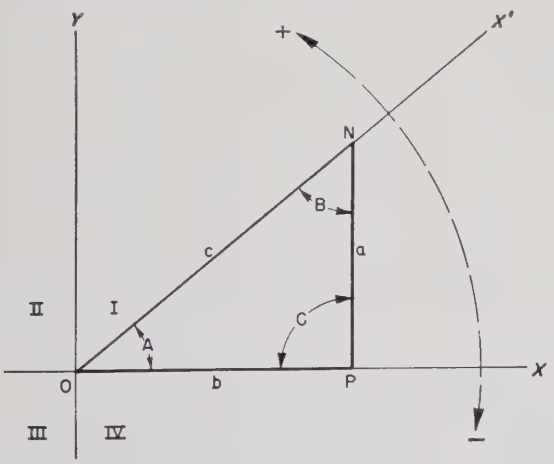

*Fig. 1—TRIGONOMETRIC RATIOS AND FUNCTIONS IN A RIGHT TRIANGLE*

Consider the right triangle $ONP$ of Fig. 1. Six possible ratios may be formed from the lengths of its sides. These are: $a/c$, $b/c$, $a/b$, $b/a$, $c/b$, $c/a$.

Since all right triangles having an equal acute angle are similar, the values of these ratios depend only upon the size of angle $A$. They are, in other words, trigonometric functions of angle $A$. They are named, abbreviated, and identified in the following way:

$a/c$ = sine of angle $A$ = sin $A$ = opposite side/hypotenuse
$b/c$ = cosine of angle $A$ = cos $A$ = adjacent side/hypotenuse
$a/b$ = tangent of angle $A$ = tan $A$ = opposite side/adjacent side
$b/a$ = cotangent of angle $A$ = cot $A$ = adjacent side/opposite side
$c/b$ = secant of angle $A$ = sec $A$ = hypotenuse/adjacent side
$c/a$ = cosecant of angle $A$ = csc $A$ = hypotenuse/opposite side

Certain less common functions of angle $A$ are:

versed sine of $A$ = vers $A$ = 1 − cos $A$
coversine of $A$ = covers $A$ = 1 − sin $A$
exsecant of $A$ = exsec $A$ = sec $A$ − 1
haversine of $A$ = hav $A$ = ½ vers $A$

Tables of the values of various functions have been constructed for a large number of angles. This has been done by using the methods of the calculus to express these functions as infinite series of algebraic terms. The values of the functions of several commonly encountered angles are given to three decimal places in the following table:

| | 0° | 30° | 45° | 60° | 90° |
|---|---|---|---|---|---|
| *sin* | 0.000 | 0.500 | 0.707 | 0.866 | 1.000 |
| *cos* | 1.000 | 0.866 | 0.707 | 0.500 | 0.000 |
| *tan* | 0.000 | 0.577 | 1.000 | 1.732 | ∞ |
| *cot* | ∞ | 1.732 | 1.000 | 0.577 | 0.000 |
| *sec* | 1.000 | 1.155 | 1.414 | 2.000 | ∞ |
| *csc* | ∞ | 2.000 | 1.414 | 1.155 | 1.000 |

Division by zero is undefined in mathematics, and the infinity symbol, ∞, in this table simply implies that the function becomes larger than any pre-assigned number as the angle indicated is approached.

**Fundamental Identities.** A group of elementary but important relationships between the trigonometric functions follows directly from their definitions. These are known as the fundamental identities. Thus, it is evident that the following reciprocal relations hold: sin $A$ csc $A = 1$, cos $A$ sec $A = 1$, and tan $A$ cot $A = 1$. Also, since $a/b$ may be written $\dfrac{a/c}{b/c}$, it follows that tan $A = \sin A/\cos A$. A third group of relationships may be obtained by applying the Pythagorean theorem to triangle $ONP$ of Fig. 1. This theorem states $a^2 + b^2 = c^2$. Dividing this equation by $c^2$, $(a/c)^2 + (b/c)^2 = 1$; or, $\sin^2 A + \cos^2 A = 1$. Division by $b^2$ yields $1 + \tan^2 A = \sec^2 A$; and by $a^2$, $1 + \cot^2 A = \csc^2 A$.

It is also of interest to know the relationship between the function of a given angle, and one that differs from this angle by an integral number of right angles. From Fig. 1, it is observed that $\sin B = b/c = \cos A = \cos(90 - B)$. In fact, it may be stated generally that any function of an acute angle is equal to the corresponding cofunction of the complement of the angle. Some of the relationships of this type are listed as follows:

$$\sin (90 - A) = \cos A$$
$$\cos (90 - A) = \sin A$$
$$\tan (90 - A) = \textit{cot}\ A$$
$$\sin (90 + A) = \cos A$$
$$\cos (90 + A) = -\sin A$$
$$\tan (90 + A) = -\cot A$$
$$\sin (180 - A) = \sin A$$
$$\cos (180 - A) = -\cos A$$
$$\sin (180 + A) = -\sin A$$
$$\cos (180 + A) = -\cos A$$

**Graphs.** An informative way of indicating the behavior of trigonometric functions is by constructing their graphs, as in Fig. 2. It is seen from these curves that the functions are periodic. That is, they repeat their values every 360°. It is also seen that the values of the sine and cosine vary between the limits of 1 and −1, while the tangent may assume all positive or all negative values.

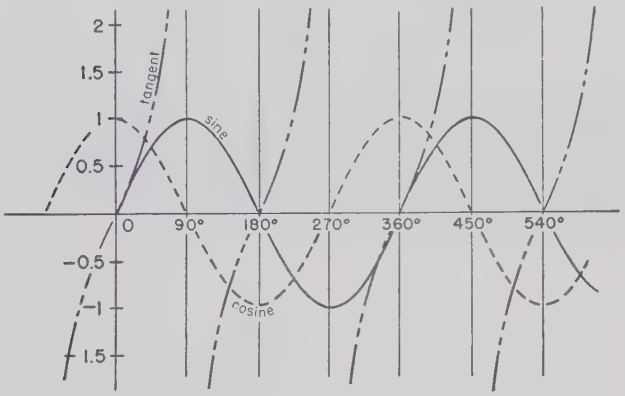

*Fig. 2—GRAPHS OF TRIGONOMETRIC FUNCTIONS*

**The General Triangle.** A triangle is defined if three parts, at least one of which must be a side, are given. (If two sides and an unincluded angle are given, two triangles may be possible.) If the triangle is dissected into right triangles, as in Fig. 3, by dropping perpendiculars from each vertex to the opposite side, it is possible to derive relationships between the known and unknown parts. In the figure, $\sin A = h/c$, $\sin B = k/c$, and $\sin C = h/a = k/b$. Eliminating $h$ and $k$, $\sin A/a = \sin B/b = \sin C/c$, an equation known as the law of sines.

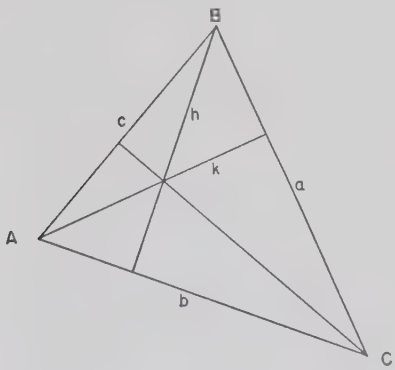

*Fig. 3—VARIOUS TRIGONOMETRIC RELATIONSHIPS IN A GENERAL TRIANGLE*

When two sides and an included angle, or three sides of a triangle, are known, the law of sines will not yield directly the unknown parts. In these cases, a relationship known as the law of cosines is applicable. This may be written: $a^2 = b^2 + c^2 - 2bc \cos A$. When angle $A$ is 90°, $\cos A = 0$, and the equation reduces to the Pythagorean theorem, which is thus a special case of the law of cosines.

**Functions of Two Angles.** It is frequently desirable to express the function of the sum or difference of two angles in terms of functions of the individual angles. Several of these relationships are as follows:

$$\sin (A \pm B) = \sin A \cos B \pm \cos A \sin B$$
$$\cos (A \pm B) = \cos A \cos B \mp \sin A \sin B$$
$$\tan (A \pm B) = \frac{\tan A \pm \tan B}{1 \mp \tan A \tan B}$$

If $A$ is made equal to $B$ in these equations, expressions are obtained for functions of twice an angle, or:

$$\sin 2A = 2 \sin A \cos A$$
$$\cos 2A = \cos^2 A - \sin^2 A$$
$$\tan 2A = 2 \tan A / 1 - \tan^2 A$$

From these equations expressions for functions of half an angle may be derived. Some of these are:

$$\sin A/2 = \pm \sqrt{\frac{1 - \cos A}{2}}$$

$$\cos A/2 = \pm \sqrt{\frac{1 + \cos A}{2}}$$

$$\tan A/2 = \pm \sqrt{\frac{1 - \cos A}{1 + \cos A}}$$

A final group of relations which may be derived from the foregoing permit the sum or difference of functions to be expressed as a product. Thus:

$$\sin A + \sin B = 2 \sin \tfrac{1}{2}(A + B) \cos \tfrac{1}{2}(A - B)$$
$$\sin A - \sin B = 2 \cos \tfrac{1}{2}(A + B) \sin \tfrac{1}{2}(A - B)$$
$$\cos A + \cos B = 2 \cos \tfrac{1}{2}(A + B) \cos \tfrac{1}{2}(A - B)$$
$$\cos A - \cos B = -2 \sin \tfrac{1}{2}(A + B) \sin \tfrac{1}{2}(A - B)$$

**Applications.** Trigonometry plays an important role in navigation, surveying, in almost every branch of engineering, and in many fields of pure science. The following illustration demonstrates the method of solution of a practical problem. A tree is sighted through a telescope which points 10° east of north. The telescope is carried to a second position 75 ft. directly west of the first, from which point the tree is observed 30° east of north. How far is the tree from the first position? In the diagram of Fig. 4, $A$ and $B$ represent the two stations, and $C$ the tree. The two base angles of the triangle are readily seen to be 60° and 100°. Since the angles of any triangle total 180°, angle $C$ must be 20°. Applying the law of sines: $b/\sin 60° = 75/\sin 20$, and $b = 75 \times \frac{0.866}{0.342} = 190$ ft. The values of the sines are obtained from a table of functions.

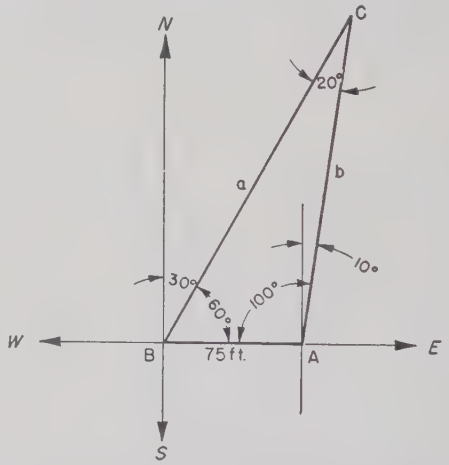

*Fig. 4—PRACTICAL APPLICATION OF TRIGONOMETRY: DISTANCE BETWEEN TWO POINTS*

## SPHERICAL TRIGONOMETRY

A spherical triangle is that part of the surface of a sphere bounded by three arcs of great circles. The principal prob-

lem of spherical trigonometry is that of determining the remaining three parts of a spherical triangle when three parts are known. Solutions of triangles are effected by the use of the same functions as in plane trigonometry. A group of ten basic equations relating the sides and angles of a right spherical triangle can be obtained quite simply. For example, $\sin b = \sin c \sin B$, where the lower-case letters refer to the sides, measured in terms of the angle they subtend at the center of the sphere, and the capitals to the angle of the spherical triangle. By dissection of oblique spherical triangles into right triangles, a series of relationships analogous to the laws of plane trigonometry can be derived. M. Co.

**TRÍKKALA** [tri′kɑlɑ], the name of a department and its capital in Thessaly, Greece. The department has an area of 1,180 sq. mi. During the fighting of World War II many of its towns were damaged, especially the city of Tríkkala itself, in July 1943. Originally known as Tricca in ancient times, the city of Tríkkala is located a few miles north of the Piniós River, at the north of the Thessalian plain, 88 mi. north of Pátrai (Patras). Center of the local trade in wheat, maize, tobacco, and silkworm cocoons, the city is an important commercial town for the region's peasant farmers and Vlach shepherds (Walachians from the Pindus and Chasia mountains. Pop. 1951 (city), 23,385; (department), 127,481. S. Van V.

**TRILBY,** a novel by George du Maurier, published in 1894, is a picture of artistic life in Paris in the 1850's. Three Englishmen became enamored of a beautiful Irish model Trilby, particularly famous for her lovely feet. The girl returns the love of one of them, "Little Billee," but gives him up because she feels she is not worthy of him. Despondent, she falls into the hands of a sinister musician, Svengali, who by means of hypnosis transforms her into the greatest singer of the era. When Svengali dies, Trilby's skill vanishes; and she soon wastes away and dies, surrounded by those who have loved her. Here and elsewhere in the novel, there are echoes of Henri Murger's *La Vie de Bohème.* H. H. Wa.

**TRILL** (in older usage, *shake*), in music, the rapid alternation of a tone with the one immediately above it, usually indicated by *tr* followed by a wavy line. This form of ornamentation was developed in the sixteenth century as a means of resolving a dissonance at a cadence, and therefore always began on the higher of the two notes. Since early in the nineteenth century, the trill has been used primarily as a virtuosic effect, beginning on the main note rather than on the upper one. W. Li.

**TRILLIUM** [trɪ′liəm], a genus of low, perennial, woodland herbs of the lily family, native to North America and eastern Asia. Of the 30 or more species, about 20 are found in North America, most of them east of the Rocky Mountains. They are erect plants, varying among species from 6 in. to 2 ft. high. From the short, thick rootstocks rise simple stems, bearing at their summit a whorl of three broad leaves and a single flower. The attractive flowers, which bloom in early spring, have thin greenish sepals and three broad, spreading petals, colored white, pink, or purplish. The common names of wake-robin, birthroot, wood lily, and ground lily are sometimes given to this genus.

Among the commonest species of the eastern United States are *T. grandiflorum,* often grown in wild gardens for its handsome white flowers which fade to pink; *T. erectum,* bearing malodorous, purplish flowers; and *T. undulatum,* having wavy, white, red-veined petals. The best known western species are *T. ovatum,* having white flowers fading to pink; *T. rivale,* bearing purple markings on its white flowers; and *T. chloropetalum,* having large reddish, yellowish or white flowers, and often bearing mottled leaves. J. C. Wis.

**TRILOBITE.** *See* PALEONTOLOGY.

**TRILUSSA** [trilu′ssɑ] (1871-1950), pseudonym of the Italian dialectal poet Carlo Alberto Salustri, was born in Rome in September 1871. At the age of fourteen he began to publish in the newspapers of the Italian capital sonnets in the *romanesco* dialect. From the regional sonnet which chronicles in satirical vein everyday events in middle-class society of Rome, he progressed to a development of the Classical fable. In this he caricatures humanity in the disguise of the animal, ridiculing with smiling malice, good-natured moralizing, and pleasing impartiality the weaknesses and passions, treacheries, and self-deceptions of all the classes of Rome, giving thereby a kind of universality to his content. Among his works are the volumes *Le Stelle de Roma* (1887), *Favole romanesche* (1900), *Ommini e bestie* (1908), *Giore e le bestie* (1933), and *Cento apologhi* (1936). The definitive edition of Trilussa's work was begun by the publisher Mondadori of Milan in 1919 and, by 1946, ran to fourteen volumes. Selected translations have appeared in several languages, including English. He died in Rome on Dec. 21, 1950. D. M. S.

**TRIM, CORPORAL,** devoted servant, in Laurence Sterne's *Tristram Shandy,* of Uncle Toby, his former captain. Trim's serio-comic sermon on mortality is justly famous.

**TRINCOMALEE** [trɪ′ŋkoməli′], a city and port on the northeastern coast of Ceylon. The city has a high year-round temperature; the coolest month, January, has an average temperature of 78° F., while the warmest month, May, averages 86° F. The average annual rainfall is about 65 in., and October, November, December, and January are the rainiest months. Most of the people depend on subsistence crops, coconut groves, and fishing for a livelihood. The shallow lagoon at Trincomalee, Lake Tamblegan, is occasionally used for pearl fishing. The city has a fine natural harbor and is the terminus of a railroad line, but it is not on the main route of trade, the hinterland does not produce much for export, and the city is thus not of great economic importance. An important and well-equipped British Naval Base was established at Trincomalee during World War II, and an airfield with runways long enough for B-29's was built from which American planes carried out missions against the Japanese in Burma and Malaya. The Portuguese originally recognized the value of the harbor and established a settlement early in the 1500's, but they lost the city to the Dutch, and the British captured the city in 1795. Pop. 1943, 29,146. J. E. F.

**TRINIDAD** [trɪ′nɪdad], a British colony, and the most southerly island of the West Indies. It is situated 15 mi. off the northeast corner of Venezuela, from which it is separated on the northwest by the Dragon's Mouth, on the west by the Gulf of Paria, and on the south by the Serpent's Mouth; it is bounded on the east by the Atlantic Ocean. The island has an area of 1,864 sq. mi. Tobago, an island lying 21 mi. northeast of Trinidad, is an administrative part of the colony; it has an area of 116 sq. mi.

Trinidad is related geologically to South America but is classified as one of the West Indies. The northern mountain range of the island, a continuation of the mountains of the Paria Peninsula of Venezuela, is formed from crystalline rock overlain by sediments; the highest elevation is 3,085 ft. There is a lower range along the southern coast. The island is famous for its asphalt lake, which covers a little more than 100 acres on the southwestern peninsula. Soft pitch appears to boil continually at the center of the lake, and masses of asphalt well up and move toward the sea like glaciers. Rain water collects on the lake's surface and flows in small streams across it. The lake is the source of valuable exports of asphalt.

*PITCH LAKE, TRINIDAD. THE ASPHALT FROM THE LAKE IS SHIPPED FROM THE NEAR-BY SEAPORT OF LA BREA TO MANY PARTS OF THE WORLD.*

BURTON HOLMES FROM EWING GALLOWAY

Other mineral wealth is represented by oil reserves, which make the island the most important oil-producing colony in the British Commonwealth. The field, at the southern end of the island, is in the Tertiary beds; it came into operation in about 1911. Production of crude oil in 1946 totaled 20,232,641 barrels. The island also has coal and gypsum deposits.

Although tropical in location, Trinidad has a comparatively temperate climate. The mean annual temperature at Port of Spain, the capital, is 77.6° F. Rainfall varies with location and elevation, averaging about 50 in. annually in the extreme west and about 150 in. in the extreme northeast, in the path of the trade winds. At one time the island was almost completely covered by a tropical rain forest, but part has been cut and plantations have been established. Cacao originally was the chief crop, but it has been replaced in economic importance by sugar cane. Both are exported, as well as coconuts and nutmeg. Rum and bitters and lime oil are other export products. Most of the island's trade is with the United States, Great Britain, and Canada.

The majority of the inhabitants are natives of the West Indies, of African descent; the balance consists of East Indians, numbering approximately 214,000, several thousand Chinese, and a small number of European and American whites. Port of Spain, the headquarters of the Caribbean Commission, is the largest town, with a population in 1946 of 97,571. English is spoken generally throughout the colony. The government is headed by a governor and a colonial secretary and includes a legislative council of five nominated and eighteen elected members. Educational facilities include 262 elementary and intermediate schools (1948) and a number of high schools, convent schools, and colleges. Pop. (off. est. 1947), 558,610.

**History.** Trinidad was discovered in 1498 by Columbus, and was settled by the Spanish in about 1532. San José de Oruna, the former capital, was burned by Sir Walter Raleigh in 1595. In 1783 the island was opened by Spain to any Catholic settlers, and a large number of French refugees arrived. The British captured the island in 1797, later receiving title to it by the Treaty of Amiens, 1802. In 1921 the Imperial College of Agriculture was established at St. Augustine, attracting students from many countries. During World War II the German submarine blockade seriously affected the island's economy until, in 1941, the United States leased sites for bases. Construction of these bases under terms of a 99-year lease agreement brought higher wages and an increased circulation of money in local enterprises. On Mar. 21, 1946, universal suffrage became effective in the colony for British citizens over 21 years of age. A new constitution was announced in January 1949 which, among other things, changed the composition of the legislative council so that a larger number of the council were elected by the populace and so that the total membership numbered twenty-three, excluding ex officio members, instead of fifteen.

J. E. F.

**TRINIDAD,** a city in southern Colorado, the county seat of Las Animas Co., situated on the Purgatoire River, about 80 mi. south of Pueblo. The city was founded in 1869 and incorporated in 1879. The local government is administered by a council and manager. Trinidad is a trade center for an extensive stock-raising area. The principal industrial occupation of the residents is the mining of the coal found in the vicinity, which also has helium gas and timber resources. Transportation facilities are furnished by the Denver & Rio Grande Western, the Atchison, Topeka and Santa Fe, the Colorado and South-eastern, and the Colorado and Southern railroads. Pop. 1950, 12,204.

**TRINITARIANS,** members of the Roman Catholic Order of the Most Holy Trinity of the Redemption of Captives, founded in 1198 at Cerfroid, France, by St. Jean of Matha and St. Félix of Valois. The order had 250 houses

within a century, and in three centuries it freed some 90,000 Christians from their Moslem captors. The friars gathered alms and served as hostages. The order suffered losses in the late eighteenth century. In 1947 it counted 370 professed members, of whom 64 were in the United States. The Trinitarian Sisters were founded in 1612 in Spain by Maria de Romero. The habit is white and ornamented with a red and blue cross. Entirely distinct from the Trinitarians are two modern American institutes for social work, founded in 1929, the Missionary Servants of the Most Holy Trinity (135 priests and brothers in 1947) and the Missionary Servants of the Most Blessed Trinity (332 sisters in 1947).

**TRINITROTOLUENE.** *See* EXPLOSIVES.

**TRINITY** (O. F. *trinité* from Lat. *trinitas,* a triad, the Trinity), the mystery of one God in three persons, the Father, the Son, and the Holy Spirit, the mystery of three distinct persons in numerically one and the same substance, nature, or essence, of which the second person proceeds from the first through true generation, the third from the first and second as from a single principle through spiration. This definition summarizes the traditional Christian doctrine of the Trinity as universally admitted before the separation of the Roman and Eastern Orthodox Churches.

Rationalists either reject the doctrine of the Trinity or radically change its meaning. Pantheists and Theosophists teach a trinity that represents an evolution of God. Conservative Protestants (notably Lutherans, Calvinists, Anglicans) profess the traditional doctrine. Modern liberal Protestants generally teach a "trinity of revelation" of purely economic character: God's common fatherhood was taught by Jesus Christ, whose spirit dwells in his followers. The Modernists regard the dogma of the Trinity as simply a Judaeo-Hellenistic theory gradually elaborated during the first four centuries after Christ.

**History of the Dogma.** It is generally agreed that the doctrine was formulated with progressively increasing clarity as its terminology developed and that it came to its full expression largely by way of correcting error or heresy. The chief steps in the history of the dogma may be briefly summarized.

*Scripture.* St. Epiphanius (d. 403) wrote: "The one Godhead is above all declared by Moses, and the twofold personality (of Father and Son) is strenuously asserted by the Prophets. The Trinity is made known by the Gospel." Theologians commonly hold that in the Old Testament there are, at most, obscure adumbrations but no distinct intimation of the Trinity, which was the object of a progressive revelation made by Christ to his Apostles and recorded in the New Testament. In various Gospel texts Catholics find the assertion of the distinct personality and the divinity of each of the divine persons; in the New Testament as a whole they find all the essential elements of the doctrine. This interpretation is rejected by liberal Protestants.

*Tradition.* The tradition concerning the doctrine of the Trinity falls into three chronological periods, spanning respectively the time before, during, and after the Arian controversy of the fourth century. Catholic theologians adduce the following arguments to prove the continuity of the Christian tradition from the earliest times: (1) the baptismal formula, (2) the ancient doxologies, (3) the formal teachings of early ecclesiastical writers, (4) the controversies with early heretical sects (Sabellians, Montanists). Certain stages may be distinguished in this tradition. The Apostolic Fathers set forth the mystery simply, the Apologists introduced some philosophical concepts in their refutation of the pagans and Gnostics, while the Fathers of the third century began a scientific exposition of the dogma against heretics who denied the divine unity or the trinity (Noëtus, Sabellius, Paul of Samosata). In brief, the ante-Nicene Fathers taught the real distinction and divinity of the three persons and the perfect unity of the Godhead; from this logically follows the perfect equality and consubstantiality of the three Persons. But in their attempts at a philosophical interpretation of the dogma, the ante-Nicene Fathers used certain expressions which would favor subordinationism. In the late seventeenth century the Socinians cited these expressions to prove that the ante-Nicene tradition agreed rather with Arius than with Athanasius; the Antitrinitarians developed this position. Catholic theologians commonly defend the orthodoxy of these early Fathers, while admitting that certain of their expressions were inaccurate and eventually dangerous.

The teachings of Arius were condemned in the first Council of Nicaea (325), which defined that the Word (the Son) is "consubstantial" with the Father. The great defender of orthodoxy against Arius was St. Athanasius (d. 373). In the first Council of Constantinople (381) the doctrine of Bishop Macedonius, which subordinated the Holy Spirit to the other persons of the Trinity, was condemned, and the consubstantiality of the Holy Spirit with the Father and the Son was proclaimed.

That the post-Nicene tradition in the West was substantially unanimous is generally admitted. Because of confusion in the understanding of the terms "nature" and "person," certain heterodox opinions were held by various individuals, and in remedy the fourth Lateran Council (1215) supplied a summary of the whole trinitarian dogma. The teaching of Photius (d. 891), that the Holy Spirit proceeds from the Father alone, adopted by the Orthodox Church after the definitive break with Rome in the eleventh century, was condemned in the West by the Councils of Lyon (1274) and Ferrara-Florence (1439).

**Theological Interpretation.** Whereas the Greek theologians in speaking of the Trinity were inclined to use analogies drawn from the external world, the Latins followed the lead of St. Augustine (d. 430), who founded the psychological theory of the Trinity by indicating the analogy between the divine processions and the human activities of thought and will. Developed, completed in detail, and perfected in terminology by the Scholastics, the theory received its classic form from St. Thomas Aquinas.

The term "Word" (Gr. λόγος, John i:1) is understood to signify the mental word or intellectual concept. The generation of the Son by the Father (Nicene Creed) is understood, then, as an act of intellectual conception necessarily producing the likeness of the object known. In God the cognitive act is identical with the divine substance; and its term, the divine Word, is subsistent and divine, the second person of the Trinity. The Holy Spirit is understood to proceed as the term of the act of the divine will, and this term too is subsistent and divine, the third person of the Trinity.

The three divine persons are coequal in substance, nature, and essence; each is God; they are indistinguishable by reason of any absolute attribute of their common divine nature. How then are they distinguished?

Latin and Greek theologians alike answered that, since in real procession the principle and the term are really related, the generation of the Son and the procession of the Spirit involve the existence in the Divinity of four real, objective, subsistent relations, whose mutual opposition constitutes the distinction between the persons. There are four such relations:

*paternitas* (fatherhood), *filiatio* (sonship), *spiratio activa* (breathing), *spiratio passiva* (being breathed); since spiration is not opposed to paternity and sonship, the four relations constitute but three persons. To those who reject revelation or consider metaphysics a mere figment of the human mind there is no value discernible in such philosophico-theological speculations. For the trinitarian theologian their value lies in the light, however feeble, they shed on what he acknowledges to be, in the last analysis, an inscrutable mystery.

**Christology.** Intimately connected, both historically and theologically, with the dogma of the Trinity is the complex of dogmatic teachings about "the Word made flesh," i.e., about the personality, nature, and operations of Jesus Christ. The basic tenets of Catholic and Orthodox Christology are three: Jesus Christ is true man; he is true God; his human nature and his divine nature are hypostatically united in the one person of the Word (the second person of the Trinity). Each of these propositions has from earliest times been bitterly opposed; each has been defended as being contained in Scripture, taught by the Fathers, defined by Ecumenical Councils; each has been developed in its theological implications and significance for Christian life; each has been subjected by Rationalists, Liberals, and Modernists to denial or attenuation.

St. Paul emphasizes Christ's share in human weakness, his sufferings, his Passion: he affirms also the divine Sonship of him "who is over all things, God blessed for ever" (Rom. ix:5). The doctrine of John i:1-14 is the foundation of John's whole theology. That the synoptic evangelists imply and anticipate the teaching of the fourth Gospel is affirmed by Catholics, denied by some Protestants. Ecumenical Councils, notably those of Ephesus (431), Chalcedon (451) and Constantinople II (553), formally affirmed the divinity of Christ and the union of his two natures in one person. The earliest Reformers retained the old teaching concerning the Incarnate Word; of later Protestants, many regard Christ as the epitome of human ideals, but only in a moral sense, not physically and consubstantially, the Son of God. *See also* ARIANISM; CREED; MONOPHYSITES; NESTORIUS; *and articles on individual councils of the Church.* N. J. T.

**TRINITY COLLEGE,** an accredited, privately controlled men's college of arts and sciences, affiliated with the Episcopal Church. It is located on a campus of 80 acres, away from the business center of Hartford, Conn. The institution started in 1823 as Washington College. The name was changed to the present form in 1845. The local chapter of Phi Beta Kappa was organized that same year. The A.B. and the M.A. are the degrees offered. Courses in pre-engineering may be elected. Dormitories are provided for students not living at home. There are chapters of several fraternities on the campus and members may live in the houses. Scholarship and fellowship offerings are generous, with more than half limited to residents of the state of Connecticut. There is also a loan fund. *For statistics see* COLLEGES AND UNIVERSITIES.

J. R. To.

**TRINITY COLLEGE,** an accredited college of arts and sciences for women, conducted by the Sisters of Notre Dame de Namur of the Catholic Church. It occupies a 35-acre campus in the suburbs of Washington, D. C. Affiliation is maintained with the Catholic University of America. First instruction was given in 1900, three years after the college was founded. Authority to grant degrees was given by act of Congress in 1935. Only the A.B. degree is offered. The well-equipped library includes special collections on Church history and John Henry Newman. Scholarship awards are generous and substantial assistance is given to foreign students. Residence halls are provided and all out-of-town students are required to live on the campus. *For statistics see* COLLEGES AND UNIVERSITIES. J. R. To.

**TRINITY RIVER,** a river in Texas 360 mi. long. It has its headwaters in the West Fork and East Fork rivers, which rise in northern and northeastern Texas and join in Kaufman Co., southeast of Dallas. The river drains a fertile and productive farming area of about 18,000 sq. mi. as it flows southeastward to enter the Gulf of Mexico through Galveston Bay. J. E. F.

**TRINITY SUNDAY,** the first Sunday after Pentecost. It was designated for general observance in the Latin Church by Pope John XXII (1316-1334). The elements of a Trinity Office for Sunday use had been assembled during the Arian controversies. The Gregorian Sacramentary (before 800) contains prayers and the Preface of the Trinity. The Micrologies of the time of Pope Gregory VII mention an office composed by Bishop Stephen of Liège (903-920) and recited in some places on the Sunday after Pentecost. Between Pentecost and Advent, the Sundays (23 to 28 in number) are by the Anglicans called "after Trinity," in the Roman calendar "after Pentecost." *See also* PENTECOST.

N. J. T.

**TRINITY UNIVERSITY,** an accredited, coeducational, privately controlled institution affiliated with the Presbyterian Church. The charter was granted in 1869. The university was situated at Waxahachie, Tex., on an 80-acre campus until 1942, when it was moved to San Antonio, Tex., and combined with the University of San Antonio. It is now housed on the latter's 107-acre campus. Degrees offered are the A.B., the B.S., the B.Mus., and the B.S. in industrial education. The library features the Ziegler Collection on the history of the Southwest and the Archives of the Presbyterian Church in Texas. Residence halls for noncommuting students have been provided. Scholarship assistance, in the form of small stipends, is available to high-school honor graduates. *For statistics see* COLLEGES AND UNIVERSITIES.

**TRIO** [tri'o], a term in music having a variety of meanings. It commonly refers to any combination of three performers, either vocal or instrumental; of these, the piano trio, consisting of a piano, a violin, and a cello, and the string trio, composed of a violin, a viola, and a cello, are most frequently encountered.

A composition written for such a combination is called by the same name. The trio sonata of the Baroque period is not a true trio, however, for the three string parts were always supplemented by the harpsichord, played from the cello, or figured bass part.

In minuets, scherzos, marches, and other examples of the "song form with trio," the middle section, usually complete in itself, is also called a trio. The name arose in this case from the ancient practice of arranging the second of three dances for three instruments only. In marches and minuets, the third section, following the trio, is usually a repetition of the first part. W. Li.

**TRIODE.** *See* ELECTRON TUBES.

**TRIPLE ALLIANCE,** a defensive coalition among Germany, Russia, and Italy, which was instigated by Otto von Bismarck, chancellor of Germany. After the Franco-Prussian

war of 1870-1871, Bismarck made it a cardinal point in his foreign policy to keep embittered France isolated. Since Russia and Austria-Hungary appeared to be the two possible allies that France might bring to its side in a projected war of revenge, Bismarck spun a web of alliances which effectively blocked off France from these powers. His aim was to prevent any coalition between states to the east and west of Germany that together might crush the new German Empire. And even though Bismarck ostentatiously spoke of German "saturation" (Germany's having reached the limit of its territorial ambitions on the continent), he knew that other states suspected and feared Germany. He thought that its safety and the hope of continued peace lay not in a display of antagonizing strength, but rather in diplomatic bonds created in accord with a policy dictated by himself.

Bismarck's initial move was the formation in 1872 of the Three Emperors' League, made up of Francis Joseph of Austria-Hungary, Tsar Alexander II, and the German Emperor, William I, who committed themselves orally to the preservation of the status quo. Victor Emmanuel of Italy supported this position the next year. The League was not satisfactory to Germany, for at a threat of war with France in 1875, other powers, including Russia, intervened in behalf of France. At about the same time, rivalry between Austria-Hungary and Russia in the Balkans forced Bismarck to choose between them, and he cast his lot with Austria. His support of Austria-Hungary became more pronounced when he opposed the territorial arrangements made by Russia after the latter had defeated Turkey in 1877. This rivalry between Austria-Hungary and Russia killed the Three Emperors' League.

**The Dual Alliance.** The Austro-Hungarian foreign minister, Count Gyula Andrássy, asked for an alliance aimed at Russia. Bismarck, after exerting very great pressure on his unwilling master, Emperor William I, consummated the Dual Alliance with Austria-Hungary in October 1879. In this arrangement Austria-Hungary refused to be bound against France. The agreement of 1879 between Germany and Austria-Hungary provided that if either party were attacked by Russia or by a power backed by Russia, the other would come to its aid. Germany and its ally also agreed that if either were to go to war with any power except Russia, the peaceful ally would observe benevolent neutrality. This alliance was a milestone in European history. Earlier alliances had been organized for specific ends which, once achieved, brought an end to the alliances. Originally the Dual Alliance was to run for five years; it was renewed in 1883 and on later occasions and lasted until both parties met defeat in 1918. Emperor William's reluctance to form the alliance stemmed from his fear that it would force Russia to the side of France, but Bismarck and Andrássy were thinking of the short-term result of curbing Russia's Balkan aims.

**Triple Alliance, 1882.** The dual partnership between Austria-Hungary and Germany was enlarged to include Italy in the Triple Alliance of 1882. The provisions of the Triple Alliance stated: (1) if France attacked Germany, the latter could count on Italian aid; (2) if Italy were attacked by France, Germany and Austria-Hungary would assist Italy; and (3) if any of the three members of the alliance were attacked by two or more powers, the remaining two members were obligated to aid. Italy's adherence to this alliance, which included its traditional enemy Austria, occasioned much surprise. The usual interpretation has been that Italy's action was dictated by anger at France's assumption of a protectorate over Tunisia (1881), a region in which Italy also had ambitions. Italy seemed really to have been animated by two aims, to strengthen the secular state against the Papacy and to gain support from the "autocratic" monarchies against a rising tide of republicanism.

Bismarck was uneasy when he contemplated an isolated and resentful Russia; he hoped for a reorganization of the Three Emperors' League. This was made easier because Russia was then at odds with Great Britain over their rival aims in Asia and the Near East, and was receptive to Bismarck's prompting. Austria-Hungary was brought in and the Three Emperors' League was reconstituted in June 1881. The agreement indicated that Germany and Austria-Hungary would not aid Great Britain against Russia, and that the latter would remain neutral in a war between France and Germany or in the event of a conflict between Austria-Hungary and Italy. This agreement was renewed in 1884 but lapsed in 1887. Like some other diplomatic agreements of this period, this was kept a tight secret and was not revealed until World War I. Austria-Hungary tied to its side both Serbia and Romania by treaty arrangements, thus setting up another check to Russia's Balkan ambitions.

In 1887 Bismarck negotiated a reformulation of the Triple Alliance. This new arrangement was made up of three treaties: (1) the old treaty of 1882 unchanged; (2) a new German-Italian treaty; and (3) a new Austro-Italian treaty. Italy could now call on German aid should a Franco-Italian conflict break out over North Africa. The Austro-Italian treaty provided for the maintenance of the status quo in the Balkans and the eastern Mediterranean, or joint division of the spoils should any territorial changes in these regions occur.

The approaching dissolution of the Three Emperors' League in 1887 caused Bismarck and the Russians to seek some alternative. The Russians wanted an understanding, hoping Germany would restrain Austria-Hungary in the Balkans. Russia and Germany signed a secret "reinsurance" treaty on the day the Three Emperors' League died. In this new agreement Russian neutrality was promised in a Franco-German war; Germany was to be neutral in a war between Russia and Austria-Hungary or between Russia and Great Britain. Bismarck's diplomacy steered the German ship of state with apparent safety between Russian and Austro-Hungarian ambitions; the isolation of France was seemingly more certain than ever.

Within a few years, however, Russia suspected Germany of hampering its designs in Bulgaria. Bismarck took steps in November 1887 to prevent Russian loans from being floated in Germany. Russian finances were then in difficult straits, which gave pause to Tsarist imperialism. But while Russian sentiment hardened toward Germany, the Tsar's government turned to Paris for much needed funds.

Despite the uncertainties that marked German-Russian relations, Bismarck strove to maintain a semblance of cordiality with his powerful eastern neighbor. The reinsurance treaty was due to expire in June 1890, and the German Chancellor initiated talks to renew it. But the new German emperor, William II, and the Chancellor were an ill-matched team, and Bismarck was dismissed. His successor was Count Leo von Caprivi, who looked with disfavor upon the reinsurance treaty, which was then allowed to lapse.

**The Triple Entente.** In the following years a series of agreements resulted in the formation of a rival group of powers, the Triple Entente, including France, Russia and England. Gradually Italy, a member of the Triple Alliance, gravitated to the Entente. A succession of crises involving

antagonistic ambitions in North Africa and the Balkans sharpened the hostility between these two power-blocs. The Triple Alliance was renewed again in December 1912, with Italy apparently on good terms with her Teutonic partners. Although Italy and Austria-Hungary watched each other warily in Albania, they and Germany signed a naval convention providing that "the naval forces of the Triple Alliance which may be in the Mediterranean shall unite for the purpose of gaining naval control of the Mediterranean by defeating the enemy fleets." Following this understanding, Italy in March 1914 obligated itself to send large military contingents to aid Germany should war break out with France.

Thus, on paper, the Triple Alliance in 1914 was more tightly knit than ever, seemingly covering every military and naval contingency. But in the crisis of July of that year the bonds proved inadequate. Germany and Austria-Hungary adhered to the obligations of the Alliance, but Italy declared it was not bound by Austria-Hungary's move against Serbia, as the Triple Alliance had been violated by Austria-Hungary, which had failed to consult the Italian government, and as the Central Powers were embarked on aggressive warfare; therefore Italy was asserting its neutrality. Italy really feared the extension of Austro-Hungarian influence in the Balkans, and was especially mindful of British naval power in the Mediterranean. Italy ultimately joined the Triple Entente in World War I, but Austria-Hungary was yoked to Germany until their alliance crashed in the ruins of defeat in November 1918. *See also* TRIPLE ENTENTE. M. K.

**TRIPLE ENTENTE** [tə̄′tə̄′t], a system of alliances joining together France, Russia, and Great Britain, which was finally consummated in 1907. It was designed to counterpoise the Triple Alliance, which had been formed earlier between Germany, Austria-Hungary, and Italy. The Entente was originally born of the French need to escape the diplomatic isolation into which she had been thrust by Chancellor Otto von Bismarck of Germany in the years that followed the Franco-Prussian War of 1870-1871.

**Franco-Russian Alliance of 1894.** France felt that she could end this isolation only by alliance with powers free from German domination. The opportunity came in the late 1880's and early 1890's when Russia, aggrieved at Germany, with whom she had been secretly allied, joined France in an alliance designed to offset German hegemony on the continent. It had been made clear to the Russians that in any Austro-Russian conflict, Germany would back Austria. During a Balkan crisis in the winter of 1887-1888, which might have involved Russia in hostilities with Austria, Bismarck supported the latter with the aggressive statement that Germany was prepared to fight a war on two fronts. At the same time Russia was barred from floating loans in Germany. France seemed to be the only recourse for Russian financial needs. French failure to detach Italy from Germany and Austria, Great Britain's apparent friendliness toward the Triple Alliance, and France's fear that the British might even join the Alliance were other factors that forced an accord of the two isolated powers, France and Russia.

Prior to the agreement between France and Russia the French fleet visited Kronshtadt, a Russian naval base near St. Petersburg. Notes were exchanged between the two governments on Aug. 27, 1891, promising in rather vague terms to "confer on every question of a nature to threaten the general peace." It was stipulated further that "in case this peace should actually be in danger," and if either France or Russia should be threatened, commitments be exchanged. In 1892 the general staffs of the French and Russian armies reached an understanding, and in January 1894 a military convention was ratified. The terms of this convention, which was secret, provided that if France were attacked by Germany, or by Italy supported by Germany, Russia would fight Germany; or if Russia were attacked by Germany, or by Austria supported by Germany, France would fight Germany; and if the forces of the Triple Alliance or any one of its members were mobilized, France and Russia would immediately mobilize their own forces and move them to their respective frontiers. France and Russia also agreed that in the event of war neither would make a separate peace, and further, that the military convention should last as long as the Triple Alliance. This alliance between France and Russia, although its exact details were kept secret, was publicly announced in 1895.

The balance of military power on the Continent then seemed to be adjusted, but rivalries in Africa and Asia helped upset it. In the 1890's France and Russia were both involved in rival expansionist programs with Great Britain; Russia against Great Britain in Asia, France against Great Britain in Africa. Germany thought it to its advantage to side with the rivals of Great Britain and at the same time to secure some gain for itself. By encouraging Russia and France to engage in such imperialist ventures outside Europe, Germany expected to weaken the effectiveness of the Franco-Russian treaty as a potential threat.

**The Entente Cordiale.** The uncommitted great power in this game of balancing alliances was Great Britain. There were occasions when it leaned to the Triple Alliance, but in the first years of the twentieth century it began definitely to move to the side of the French. The British were fearful of mounting German economic power. German support of the Boers in South Africa in their conflict with the British angered Great Britain. Even more disturbing was Germany's attempt to organize a coalition to obstruct the continued expansion of the British Empire. The Reichstag passed a law which provided for a substantial increase in the German navy, so as to make it strong enough to challenge the British fleet. High German officials, who had convinced themselves that Germany was strong enough to play a lone hand, nevertheless preferred an alliance with Great Britain, but on their own terms. And their terms were high, because Germany thought that Great Britain's differences with France and Russia were too great to be surmounted. German diplomacy miscalculated; Great Britain arrived at an understanding with both France and Russia. Great Britain's first significant departure from her isolated diplomatic position was an alliance with a non-European power, Japan, in 1902. Four years earlier, in 1898, the British and the French had composed their differences in Africa, averting a conflict threatened because of the Fashoda incident in the Sudan. Théophile Delcassé, the French minister of foreign affairs, urged an alliance with Great Britain, endeavoring at the same time to woo Italy from Germany's side. By 1900 an agreement was reached providing for French recognition of Italian aims in Tripoli, while Italy recognized French expansion in Morocco. Furthermore Italy, a member of the Triple Alliance, signed a secret agreement with France in 1902 promising to remain neutral in case of a Franco-German war. The Anglo-French *rapprochement* was hurried along by King Edward VII's popularity with the French. By April 1904 an agreement had been reached. The Entente Cordiale settled territorial differences between the two powers in various colonial areas, including French withdrawal from Egypt, while Great Brit-

ain relinquished its rights in Morocco. Although this agreement ostensibly was merely a friendly disposition of rival claims outside Europe, diplomats were aware that if Great Britain and France could co-operate in other continents, they could do likewise in Europe.

**Formation of the Triple Entente.** Following these agreements, Delcassé strove to effect an understanding between Great Britain and Russia so as to round out his diplomatic edifice. The two powers were mutually agreeable. Negotiations between the Russians and British were begun in 1906, and by August 1907 an agreement was reached between them. Its most important feature provided for a division of influence in Persia, the British sphere to be in the south, the Russian in the north, and a neutral zone between them. The Russians were also given to understand that Great Britain might relax her opposition to Russian men-of-war using the straits at Constantinople. Both Great Britain and Russia were careful to assure Germany that their understanding was not aimed at her, but presumably they had Germany in mind during their negotiations. The British foreign secretary, Sir Edward Grey, said, "An entente between Russia, France, and ourselves would be absolutely secure. If it is necessary to check Germany, it could then be done."

In the early years of the twentieth century a series of crises in Africa and the Balkans tested the strength of these agreements. Italy continued to gravitate to the Triple Entente; at Racconigi in 1909 she agreed with Russia to help stabilize the *status quo* in the Balkans "to the exclusion of all foreign domination." Russian interests maintained in the Bosporus were to be favored by Italy, whose expansion in Tripoli and Cirenaica was to be sympathetically viewed by Russia. This meant that Italy and Russia agreed in opposing Austrian influence in the Balkans. From 1912 to 1914 the bonds uniting the Triple Entente were reinforced, although no formal alliance was announced. Military and naval arrangements were perfected, and more precise commitments were initiated. The two rival blocs, the Triple Entente and the Triple Alliance, maintained an uncertain peace until 1914, when they finally went to war. *See also* TRIPLE ALLIANCE. M. K.

**TRIPOLI** [trĭ′poli] (*Arab.* Tarabulus esh Sham), a city on the northern coast of Lebanon, 43 mi. northeast of Beirut. The city is situated on a small rocky promontory of the narrow coastal plain backed by the Lebanon Mountains. Its history is similar to that of other Levantine cities. Founded probably in the seventh century B.C., it was the capital of the Phoenician federation including Sidon (Saïda), Tyre (Sour), and Aradus (Arwad). It was enlarged by the Seleucids and Romans and then taken by the Moslems in A.D. 638. Besieged for five years during the Crusades, it was taken by Raymond de St. Gilles, Count of Toulouse, in 1109 and the great library founded by the ruling family was destroyed. The city was laid waste by the Egyptian Sultan Kalaun in 1289. Later a part of the Turkish Empire, Tripoli was liberated by General Allenby in 1918, and in 1920 it became part of the Grand Liban. During World War II, it was occupied by the English and the Free French in 1941 and in the same year joined the Republic of Lebanon. The ruins of an old Turkish fort are immediately inland from the city, and there is an American School.

The climate is Mediterranean, with long, hot, dry summers and short, cool, wet winters. The average annual temperature is 69° F., with a January average of 56° F. and an August average of 82° F. The average annual rainfall is 39 in. Vegetation is semiarid, and agriculture is limited by the hot, dry summers and the small amount of level land. Wheat, millet, vegetables, tobacco, olives, and citrus fruits are grown. Industries include soap manufacture and sponge fishing. Oranges, eggs, and cotton are exported. Tripoli is the terminus of the oil pipe line across the Syrian desert from Iraq. There are an oil-tank depot, a pumping station and equipment to load tankers that anchor off shore, and a refinery. When the production at Haifa was disrupted in 1948, the economic importance of Tripoli was increased. Pop. 70,842. J. E. F.

**TRIPOLI** (*Arab.* Tarabulus el Gharb), the capital of Libya and chief port of Tripolitania, the ancient Oea of Phoenician origin. With the decline of Sabrata and Leptis Magna, the capital, known as Tripolis ("Three Cities"), increased in importance, aided by its position as terminus of one of the chief overland routes from the Sudan and central Africa. At Tripoli a line of low rocks extends several hundred feet out into the Mediterranean, providing moderate protection for ships on a coast noted for its lack of good harbors. This port came successively under the rule of Carthage, Rome, the Vandals, the Byzantine Empire, the Arabs, Spain, the Knights of St. John, the Ottoman Empire, and Italy. Almost destroyed during the seventeenth and eighteenth centuries by French and English fleets, as reprisal for the acts of its pirates, Tripoli was blockaded by the United States fleet in 1804, in an effort to end piracy in the Mediterranean. During World War I, it was one of the few places in Tripolitania held by Italian forces. In World War II, it suffered considerable damage, was captured by British forces on Jan. 23, 1943, and became the seat of the British Military Administration.

Tripoli lies in a narrow oasis of about 19 sq. mi., beyond which stretches the desert. The old section of the city is near the port and is mostly occupied by Arabs. The rest of the city, lying to the south and east, is mainly modern. Among the important buildings are the Castle or Citadel, begun on the site of an older fortress in 1535 by Georg von Schilling of the Knights of St. John; the Pasha or Karamanli Mosque, founded in 1740 by the native chief who brought Tripolitania some measure of independence from the Turks; the Gurgi Mosque (1833); and a Roman triumphal arch dated A.D. 163.

The industry of the city includes artillery and tobacco factories, saltworks, and a brewery. There are railroad connections with Zuára (74 mi.) and Garian (60 mi.), and a network of roads connects Tripoli with other cities of the province. There are steamships to African and European ports, and there is international air-line service. Pop. 109,000. *See also* TRIPOLITANIA. R. G. W.

*HISTORIC CASTLE IN TRIPOLI, LIBYA*

EWING GALLOWAY

**TRIPOLITANIA** [trɪ′polɪte′nyə; tripolitɑ′nyɑ], the northwest province of Libya, formerly an Italian colony in North Africa. With an area of approximately 156,333 sq. mi., it is bounded by the Mediterranean Sea on the north, Cyrenaica on the east, Fezzan on the south, and Algeria and Tunisia on the west. Originally the three Phoenician coastal cities of Leptis Magna, Oea, and Sabrata, of which Oea in the center was the capital, were known as Tripolis ("Three Cities"). Under the influence of Carthage until its fall, Tripolitania came under Roman rule in the second century B.C. Conquered by the Vandals in the fifth century A.D. and by the Byzantine general Belisarius in the sixth, in the seventh century the region was overrun by Arabs from Egypt. After 670, Tripolitania remained under Arab rule, sharing the fortunes of Tunisia, except for brief periods of occupation by the Normans (1146-1158), the Spaniards (1510-1530), and the Knights of St. John (1530-1551), and a short independence under local rulers (1354-1369). In 1551 it was established as a vassal state to the Ottoman Empire and became an active center of piracy. The native Karamanli Dynasty, established in 1711, was overthrown during a civil war in 1835, and Tripolitania was made a vilayet of the Turkish Empire. In 1911 Italy occupied eight coastal cities, and by the Treaty of Ouchy in 1912 Turkey ceded the rest of Libya to Italy. The country was in a state of revolt during World War I, but the Italian governors restored order and brought a considerable degree of progress and prosperity. The region was much fought over during World War II, Libya becoming a trusteeship of the United Nations after the war, with Tripolitania under British rule. Libya became an independent kingdom on Dec. 24, 1951.

Along the coast from Misurata to Zuára there are intermittent and narrow strips of oases. Inland, steppes shade off rapidly into a desert zone of sand, gravel, and rock. A line of hills, the Gebel Nefusa, lies inland roughly along 32° N. lat. The climate is dry and hot, but with seasonal variations in temperature, depending largely on the direction of the wind. When the *ghibli,* or sirocco, blows from the desert, temperatures at Tripoli on the coast may reach above 110° F. The average annual rainfall on the coast is 14 in., which decreases inland. There are no permanent streams.

In view of these conditions, Tripolitania produces little and has only a sparse population, though it has the highest density per square mile in Libya. Between World Wars I and II, Italian immigration was encouraged and a great deal of money was spent in an effort to create Italian farming communities, either directly or through concessionaires. Wells were sunk, roads were built, and shifting sand dunes were immobilized and afforested with acacia, poplar, and pines. However, it was found that without heavy and continuous subsidy the colonists returned to Italy or moved into the near-by cities. The chief products of the region are wine, tobacco, olive oil, castor oil, fruit, vegetables, cereals, alfa grass, henna, sponges, tunny fish, salt, and silkworms. Exports consist of wool, hides, salt, sponges, fish, olive oil, cereals, vegetables, and fruit.

Along the coast and in the Gebel Nefusa there is an extensive network of highways. There are railroad lines from Tripoli through Zauia and Agelat to Zuára on the west and to Tagiura on the east, as well as inland to Azizia. The chief cities and towns are Tripoli, Misurata, Homs, and Zuára, all along the coast. Pop. 1951, 768,600. R. G. W.

**TRIPTOLEMUS** [trɪptɒ′ləməs], in Greek mythology, the son of Celeus, king of Eleusis, and Metaneira; according to others, the son of King Eleusinus. In some legends, he is the inventor of the plough and the discoverer of agriculture, to whom Demeter gave a chariot with winged dragons to enable him to carry the art of corn planting to other lands. On his return to Attica, Triptolemus established the worship of Demeter at Eleusis. *See also* DEMETER. G. E. D.

**TRIPURA** [trip′ura], a state in the Republic of India, touching Assam in the east and otherwise surrounded by East Pakistan. Its 4,032 sq. mi. are mostly hilly and covered by jungle. Rice, jute, and cotton are raised in the west, and timber, tea, and fruit are grown in the hills. The capital is Agartala, near the Pakistan border. Governed by a Chief Commissioner and an electoral college, Tripura is strategically important because of its common boundary with Pakistan; from 1946 to 1951 it received more than 100,000 Hindu refugees. Pop. 1951, 639,029. R. D. L.

**TRISACCHARIDES.** *See* SUGAR CHEMISTRY (*Oligosaccharides*).

**TRISECTION OF AN ANGLE.** *See* GEOMETRY.

**TRISSINO, GIOVANNI GIORGIO** [tri′ssino] (1478-1550), Italian author, was born at Vicenza, July 8, 1478. He was associated as courtier and man of letters with various courts of northern and central Italy, and with Popes Leo X and Clement VII. He died at Rome, Dec. 8, 1550.

Trissino was one of the outstanding exponents of Hellenism in the Italian Renaissance, attempting to write works in Italian in the manner of the Greek drama and epic and following the precepts laid down in Aristotle's *Poetics.* His *Sofonisba,* finished at Rome in 1515, was a tragedy on the Greek model containing a chorus and observing the unities of time and action. *Italia liberata dai Goti* ("Italy Delivered from the Goths") was a similar effort in the field of the epic. Completed in 1547 after twenty years of labor, the poem was modeled on the *Iliad* and dealt with the war between the armies of Belisarius and the invading Goths.

Trissino also attempted to Hellenize the Italian language, going so far as to propose that certain Greek letters be introduced into the Italian alphabet. His view on the question of language in general, expressed in *Il Castellano* (1529), was that the speech of the learned and aristocratic classes, purged of regional peculiarities and ennobled by contact with the two Classical tongues, should be adopted as standard Italian in preference to Tuscan. G. R. S.

**TRISTAN DA CUNHA** [trɪ′stan də ku′nyə], a small group of volcanic islands in the South Atlantic Ocean about midway between Capetown and Cape Horn at 37° 6′ S. lat. and 12° W. long. They were discovered and named by the Portuguese in 1506. Long used as a port of call by Antarctic whalers, they were first occupied in 1810 and annexed by the British in 1816, although the garrison was withdrawn in 1817. Since 1938 the islands have been administered by St. Helena, and the inhabitants, over 100 in 1950, although highly inbred, are exceptionally healthy and long-lived. W. M. W.

**TRISTAN UND ISOLDE** [trɪ′stɑn ʊnt izo′ldə], a music drama in three acts by Richard Wagner, suggested by the thirteenth-century epic poem by Gottfried of Strassburg, which recounts the story of Tristram and Iseult. It was first performed on June 10, 1865, in Munich, Hans von Bülow conducting, although written between 1857 and 1859, when Wagner interrupted his work on the *Ring* cycle in the hope of creating a work easier to produce. *Tristan,* however, also presented difficulties for the opera houses of the time,

and the work was not produced until King Ludwig of Bavaria provided Wagner with almost unlimited facilities.

The music drama calls for only two principals, Tristan and Isolde. Tristan (tenor), a young knight at the court of King Mark of Cornwall (bass), has been sent to escort the King's intended bride, Isolde (soprano), from Ireland. On the return voyage, Isolde, who is both in love with Tristan and angered at his taking her to King Mark, resolves that both of them shall die. Consequently she prepares a poison potion for them both. Her nurse, Brangaene, substitutes a love philter, however, and the lovers are inspired with an irresistible passion for each other. The marriage to King Mark cannot be prevented, but neither can their love be quenched, and when Tristan resists the attempt of King Mark's knights to take Isolde from him, he is fatally wounded. He is borne to his own castle, but although Isolde comes to nurse him he does not survive the joy of seeing her again. Isolde dies of grief as King Mark, who has been told of the potion, arrives with his forgiveness.

The desire for fulfillment of love in death motivates the opera; the long-continued and unresolved chromatic passages, according to the composer, closely parallel the hopeless longing of the lovers. This feeling is partly the influence of Schopenhauer's philosophy upon Wagner, but it is perhaps worth noting also that during the composition of *Tristan* Wagner was in love with Mathilde Wesendonck, the wife of one of his closest friends, and derived some *Tristan* material from his settings for some of her poems.

*Tristan und Isolde* and *Die Meistersinger* are usually considered the most satisfactory of the Wagnerian music dramas in the sense that in them the musical form is clearest and the text and action most direct, so that the unity Wagner strove for is most nearly achieved. One tragic, the other comic, they stand at the peak of accomplishment of a Romantic era which was single-mindedly devoted to the expression of feeling through music. S. C.

**TRISTRAM,** a legendary hero whose origins have been traced to Scandinavian and Celtic sources. According to the main line of the many stories told of him, the noble Tristram is kidnapped from northwest Britain by pirates and carried off to Cornwall. After making his way to the court of his uncle, King Mark, he is sent to Ireland to bring back Iseult as a bride for King Mark. On the voyage back, Tristram and Iseult drink by mistake a potion that makes them eternal lovers. After reaching Mark's court, Tristram flees to France and, believing himself forgotten, weds Iseult of Brittany. Wounded by a poison arrow, he sends for Iseult of Ireland, arranging that the returning ship carry a white sail if she is on it, a black one if she is not. His wife, hearing of the plan and seeing a white sail approaching, tells Tristram that it is black. He despairs, and Iseult arrives too late to save her lover. She lies down beside him and dies also. Thomas Malory, Matthew Arnold, Richard Wagner, Edwin Arlington Robinson, and others have written different versions of the Arthurian legend.

**TRISTRAM SHANDY,** a novel by Laurence Sterne, originally published in nine volumes between 1759 and 1767. Deliberately without plot, the novel progresses by a series of lively scenes, comic and sentimental, interrupted by Sterne's dramatic monologues. Tristram Shandy is not even born until the third volume, the dominant characters being his father, Walter, and his Uncle Toby, totally unlike except in mutual devotion. Sterne ranges from broad and vulgar humor to delicate comedy. W. B. C. W.

**TRITON** [trai′tən], in Greek mythology, the son of Poseidon and Amphitrite, usually represented with a trumpet made from a sea shell. With this trumpet he aroused or soothed the waves at Poseidon's command. When Misenus, Aeneas' trumpeter, challenged him to a contest, Triton hurled him into the sea. Triton was a merman, human from the waist up, fish-shaped from the waist down. Some writers refer to the existence of numerous tritons. G. E. D.

**TRITONE.** *See* Musical Terms.

**TRIUMVIRATE** [traiʌ′mvirət], a governmental board in ancient Rome composed of three members. There were, for example, the III *viri capitales* who served as police magistrates, or the III *viri monetales* who were connected with the mint. Better known, however, are the so-called First and Second Triumvirates which exercised political power in Rome in the first century B.C. The First Triumvirate was an extraconstitutional body which came into existence in 60 B.C. when Caesar, Pompey, and Crassus formed a coalition based upon a private agreement. By combining their political forces, these unofficial triumvirs were able to control Rome as effectively as if they had legal sanction for their position. The Second Triumvirate, on the other hand, was actually established by a law of 43 B.C. which made Octavian, Antony, and Lepidus III *viri reipublicae constituendae* for a period of five years; in 38 B.C. their powers were extended for another five years. In reconstituting or restoring the Republic after the civil wars following the death of Caesar, the Second Triumvirate was granted powers which made the board superior to the ordinary magistrates of Rome. They directed foreign policy, managed taxation and finance, but did little toward the restoration of the Republic. T. B. J.

**TRIVANDRUM** [triva′ndrəm], the capital of Travancore-Cochin State in southwestern India, near the Malabar Coast. The city is situated on a low coastal plain and has a hot and humid climate. The district produces rice, coconut palm, spices, betel nuts, and rubber. Teak, bamboo, and ebony grow in the forests where there is an extensive game preserve. Handicrafts include weaving and ivory carving. Trivandrum is a university center with about 15 colleges and is noted for its ancient fort and palace and its great temple to Vishun. Pop. 1951, 186,931. J. E. F.

**TRNOVO.** *See* Turnovo.

**TROADES (THE TROJAN WOMEN)** [tro′ədiz], one of the best tragedies of Seneca, the Roman tragic dramatist of the first century A.D. The *Troades* portrays the sufferings of the Trojan women taken captive by the Greeks after the fall of Troy. The plot is twofold and concerns both the sacrifice of Polyxena, daughter of Hecuba and Priam, demanded by the ghost of Achilles as his due, and the execution of Astyanax, son of Hector and Andromache; the impact of the two deaths upon the sorrowing Hecuba serves to unify the plot. The characterizations of Agamemnon and Pyrrhus are unusually effective, and the scene in which Andromache attempts to conceal her child Astyanax from Ulysses is perhaps the most moving and dramatic scene in all Senecan tragedy. The play was modelled upon Euripides' *Hecuba* and *The Trojan Women,* with possible influences from earlier Roman tragedy. G. E. D.

**TROELS-LUND.** *See* Lund, Troels Frederik.

**TROGIR.** *See* TRAÙ or TROGIR.

**TROGON** [tro′gɒn], any one of a number of species of nonsinging birds not closely allied to any other living group. They are characterized by weak wings and feet, a relatively long tail, and a wide mouth fringed with recurved bristles; their plumage is remarkable for its soft and loosely seated feathers. They inhabit tropical and subtropical regions around the world, excepting Australia, New Zealand, and the oceanic islands; one species, the coppery-tailed trogon, *Trogon ambiguus* (11¾ in. long), crosses the Mexican border into extreme southern Arizona. Trogons wear such brilliant hues as carmine, pink, and yellow, and metallic greens, blues, and violets; the sexes are usually differently colored. They live in forested country and feed on fruits and caterpillars, which, despite their feeble powers of flight, they take mainly on fluttering wings. All lay their white or bluish-green eggs in hollow trees. The best-known species is the famous quetzal of the New World tropics, the national bird of Guatemala. *See also* QUETZAL. H. G. De.

**TROILUS AND CRESSIDA** [trɔi′ləs, krɛ′sɪdə] (1602), one of the most problematic of Shakespeare's plays, was probably written for a special private performance. It sets the love story of Troilus against the background of the Trojan war. In the development of this theme Shakespeare follows a convention established since Chaucer's day, and degrades Cressida into a worthless wanton, distributing her favors to Greek and Trojan alike. The characters of Greeks and Trojans are drawn rather in accordance with medieval conceptions than with the Homeric originals. One of them, Thersites, borrowed from Chapman's translation of the *Iliad,* is the most foul-mouthed rogue in Shakespeare's plays; his running commentary on the war reduces it to a struggle to regain a cuckold's whore. The play is loaded down with long philosophical and ethical harangues, but among these are passages of grave and noble poetry. T. M. P.

**TROILUS AND CRISEYDE** [trɔi′ləs, krɪse′də], a long narrative poem in five books by Geoffrey Chaucer, written about 1385. Troilus, son of King Priam of Troy, second only to Hector in martial prowess, after a prolonged courtly wooing, wins the love of Criseyde, daughter of Calchas, a traitor to Troy who has fled to the Grecian camp. In an exchange of prisoners she is returned to her father and, unfaithful to Troilus, accepts the Greek Diomede as her lover. Chaucer based his story on *Il Filostrato,* a poem by the Italian, Boccaccio. His poem, in turn, is the principal source of Shakespeare's play *Troilus and Cressida.* R. K. R.

**TROIS MOUSQUETAIRES, LES** [lɛ trwa′ mu′skə-tɛ′r] **(THE THREE MUSKETEERS),** one of the most popular historical novels of all times, was published in 1844 under the name of Alexander Dumas père, who had the collaboration of Auguste Maquet. The story is based principally upon the so-called *Mémoires de M. d'Artagnan* (1701-1702) by Gatien de Courtilz de Sandras. It relates the stirring adventures of three of Louis XIII's musketeers, Athos, the type of perfect gentleman, Porthos, the personification of physical strength, Aramis, half-priest, half-soldier, and the impetuous but wily Gascon cadet, D'Artagnan, all united by the immortal device, "All for one, one for all." The plot, rapid, natural, humorous in parts, always life-like, relates how the musketeers thwarted Cardinal Richelieu's attempt, through the agency of the infamous Milady de Winter, to expose the love of Queen Anne of France for the Duke of Buckingham. Milady, after poisoning beautiful Mme Bonacieux, the mistress of D'Artagnan, is finally captured, tried, and beheaded by the musketeers. R. A. P.

**TROIS-RIVIÈRES** [trwa′ ri′vyɛ′r], a port city and the county town of St. Maurice Co., Quebec, Canada, at the confluence of the St. Maurice and the St. Lawrence rivers, 87 mi. northeast of Montreal on Highway 2. It is connected by bridges across the St. Maurice River with Cap de la Madeleine. Transportation is provided by the Canadian Pacific and the Canadian National railways. Its harbor has 7,400 ft. of berthing space, a 2,000,000 bushel elevator, and a large coal dock. The harbor is open for eight months each year. There are large pulp and paper mills, various textile factories, rolling mills, and glove and footwear factories in the city, which was founded as a fur trading post in 1634. In 1737 blast furnaces to reduce iron ore were set up near by, and nails and kettles and stoves were manufactured. From 1850 to 1900 it was the outlet for lumber from the St. Maurice Basin, and during the twentieth century it has become one of the foremost pulp and paper towns in Canada. Pop. 1951, 46,074. D. F. P.

**TROJAN HORSE,** in Greek legend, the wooden horse constructed by Epeus to enable the Greeks to enter Troy. After trying unsuccessfully for ten years to capture the city by force, the Greeks resorted to stratagem. They pretended to sail away and left on the shore a huge horse filled with armed men. While the Trojans were examining the horse, Sinon, a Greek, put in an appearance and was captured posing as the victim of Odysseus' hatred; he told them that the horse was an offering to Athena and that it would bring disaster to the Greeks if taken into the city. When Laocoön, a priest of Poseidon, advised the Trojans against dragging the horse inside the wall, two huge snakes appeared and overpowered both Laocoön and his two sons. The Trojans were convinced, both by Sinon's lies and by the prodigy of the snakes, and pulled the horse into the city with songs and festivity. That night Sinon let out the armed men enclosed in the horse's body, the gates of the city were opened to the rest of the Greek forces, and the city was captured and burned. *See also* TROJAN WAR. G. E. D.

**TROJAN WAR,** in Greek legend, the ten-year war waged by the Greeks under Agamemnon for the recovery of Helen, the wife of Menelaus. The tradition probably reflects a real war between the Achaeans and the inhabitants of the Troad, which resulted in the capture and destruction of Troy in the early twelfth century B.C. The legendary accounts traced the origin of the war to the marriage of Peleus and Thetis, on which occasion Eris, the goddess of Discord, angered at not being invited, threw among the guests a golden apple, inscribed "To the Fairest." Hera, Athena, and Aphrodite each claimed the apple, and the decision was left to Paris, the son of King Priam. Paris, who was then a shepherd on Mount Ida, awarded the prize to Aphrodite, who had promised him in return the fairest woman on earth as his wife. Later he visited Menelaus, king of Sparta, and met Helen, who was the destined gift; aided by Aphrodite, he then persuaded Helen to escape with him to Troy.

Menelaus at once called the kings of Greece to his aid, and a great expedition was assembled at Aulis under the leadership of Agamemnon, king of Mycenae and brother of Menelaus. Their departure, however, was delayed by a calm sent by Artemis, who was angry with Agamemnon for slaying a

stag sacred to her. Appeasement of the goddess required the sacrifice of Iphigenia, the daughter of Agamemnon, but at the moment of sacrifice Aphrodite substituted a deer for the maiden and carried off Iphigenia in a cloud to the land of the Taurians.

The wind was now favorable and the fleet sailed to Troy. Upon its arrival, the first Greek to perish in battle was Protesilaus, who was slain by Hector. The Greek heroes greatly outnumbered the Trojans and included Achilles, Diomedes, the two Ajaxes, Idomeneus, Odysseus, and Nestor; Philoctetes, the possessor of Heracles' bow and poisoned arrows, had been left behind on the island of Lemnos with an infected foot, the result of a snake-bite. On the Trojan side the chief warriors were Hector, Paris, and Aeneas, and also Sarpedon and Glaucus, who had come as allies from Lycia.

The first nine years of the war were uneventful. Thereafter, however, the withdrawal of the wrathful Achilles from battle, as related in Homer's *Iliad,* resulted in a Trojan advance to the ships and in the death of Achilles' friend Patroclus. This moved Achilles to return to battle, with the result that the Trojans were repulsed and Achilles avenged his friend by slaying Hector. When additional allies came to help Troy, Achilles slew their leaders also, Memnon, king of Ethiopia, and Penthesilea, queen of the Amazons. But the Greek hero was not destined to see the fall of the city, for Paris, aided by Apollo, wounded him fatally in the heel with a poisoned arrow. His armor was claimed by both Odysseus and Telamonian Ajax, who committed suicide in rage and madness when the arms were awarded to Odysseus. Then, since Troy could not be taken without the aid of Achilles' son Neoptolemus (Pyrrhus), and the arrows of Heracles, Neoptolemus was summoned, and he and Odysseus (or Odysseus and Diomedes) induced Philoctetes to bring Heracles' weapons to Troy. Paris, wounded by Philoctetes, appealed for aid to Oenone, whom he had abandoned for Helen; but she refused to heal the wound, and Paris died.

In the end, the city was captured and burned by the Greeks through the stratagem of the wooden horse. King Priam was slain by Neoptolemus, and few other Trojans survived. One of these was Aeneas, who was under divine instructions to rule over the remnants of the Trojans; he escaped from the burning city with his father Anchises and his son Ascanius, but his wife Creusa was lost. Of the Trojan women, many were allotted to the Greek leaders as captives; Cassandra fell to the lot of Agamemnon, Queen Hecuba went to Odysseus, Andromache was taken by Neoptolemus, and Polyxena, the daughter of Priam, was claimed by the ghost of Achilles as his prize and was slain on his tomb. Fearing that Astyanax, the son of Hector and Andromache, might grow to manhood and seek vengeance on Greece, the Greeks killed him by throwing him from the walls of Troy. Menelaus regained possession of Helen and ultimately arrived home in Sparta after being driven by storms to Cyprus, Phoenicia, and Egypt. Agamemnon returned to Mycenae, where he was slain by his faithless wife Clytemnestra. The most famous "return" was that of Odysseus, whose wanderings and arrival in Ithaca ten years later are related in Homer's *Odyssey. See also* AENEID; ILIAD, THE; ODYSSEY, THE; TROJAN HORSE. G. E. D.

**TROJAN WOMEN, THE,** a tragedy by Euripides, presented in 415 B.C. As the play begins, Troy, for ten years besieged by the Greeks, has fallen. The plot consists of the pathetic incidents that occur on the morning of the Greek departure, and attention is centered upon what befalls the women and children of the conquered. The main characters are Hecuba, the widowed queen of Troy; her daughter Cassandra, virgin priestess and destined concubine of the Greek Agamemnon; her daughter-in-law Andromache, Hector's wife, whose little son is taken from her to be thrown from the city's walls; and the Greek adulteress, Helen, the cause of the war. The focal point and unifying force of the drama is Hecuba, who is both an individual sufferer and, together with the chorus of Trojan women, the symbol of the suffering of the mother city itself. The play is one great lyrical lamentation from the lips of the vanquished and victimized and becomes one of the most powerful indictments of war ever presented. S. D. At.

**TROLLEY BUSSES,** electrically-propelled urban passenger vehicles, designed to run on pavement instead of on rails. The trolley bus is a relative newcomer, for, although experimental models were tried early in the twentieth century, the modern type was introduced in 1928. Its electrical features resemble those of the streetcar, whereas its chassis and body are almost identical with those of the motor bus. The seating capacity of most trolley busses built after 1936 is 40 to 45.

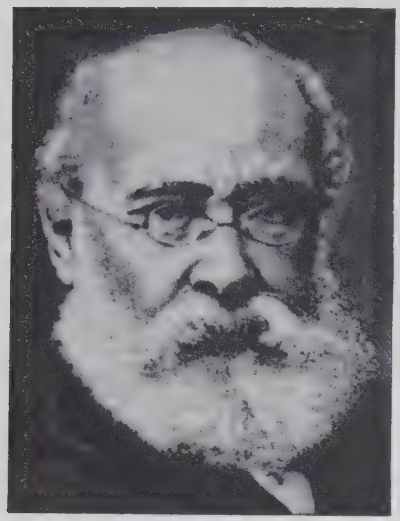
Direct current at 600 volts is taken from two parallel overhead contact wires by under-running contact shoes in swiveling heads at the ends of a pair of trolley poles with swiveling bases, mounted on the roof. The trolley bus can digress from a central position 12 to 15 ft. to stop at the curb and to pass obstructions such as double-parked vehicles.

Normally, one series-wound or compound-wound electric motor mounted under the body drives the rear wheels through a shaft and differential gear as in a motor bus. Braking is regenerative or dynamic, as in most modern streetcars. The controller, usually of the cam type, is beneath the body. Controller and brake are pedal-actuated. Acceleration and braking rates of 3.5 to 4 miles per hour per second, combined with maximum speeds of 30 to 35 m.p.h., are usual. *See also* ELECTRIC TRACTION; MOTOR VEHICLES (*Busses*); STREETCARS, ELECTRIC. M. Bu.

**TROLLOPE, ANTHONY** [trɒ'ləp] (1815-1882), English novelist, was born Apr. 24, 1815, in London. His father, Thomas Anthony Trollope, an impractical man, the author of an unfinished *Encyclopedia Ecclesiastica,* died in Belgium in exile for his debts; his mother, Frances Milton Trollope, turned to literature in an attempt to provide some sort of income. After a trip to America in pursuit of a rather ill-conceived scheme to open a department store in Cincinnati, she had made her fame with her *Domestic Manners of the Americans* (1832) and had followed this work with an endless succession of novels. The son Anthony had consequently a tempered inheritance of literary failure and success, an inheritance that he shared with the lesser talent of his brother, Thomas Adolphus.

The loneliness of Anthony Trollope's early years sprang from several causes: the stern aloofness of his father, the busy preoccupation of his cheerful mother with her own affairs, the desolate three years at Winchester School, beginning in 1827, and the dreary time spent at Harrow. In 1834, some time after the family had fled to Belgium because of the father's debts, his mother's influence procured for Trollope the offer of a job in the General Post Office in London. The position influenced his later work, for when Trollope became a successful author, he became so as a sort of lesser Chaucer, as a man who noticed the small gestures and habits and features of his characters, and through all of these indicated surely their personalities. He later perfected

his technique so that he could extend it in imagination; for his most famous figures, his Church of England clergy, seem to arise from nice observation, and yet, in the words of Trollope himself in his *Autobiography,* "My archdeacon, who has been said to be lifelike . . . was, I think, the simple result of an effort of my moral consciousness . . . as far as I can remember, I had not then even spoken to an archdeacon." The careful and curious examination of human



ANTHONY TROLLOPE

WIDE WORLD

nature that time and circumstance made possible for Trollope during his time in London bore fruit in his most successful works.

Seven years after Trollope had taken his junior clerkship in the General Post Office in London, he was made Deputy Postal Surveyor, stationed at Banagher in Ireland; three years later, in 1844, he married Rose Heseltine. During his years in Ireland there came the beginning of that prolific output of novels that characterized Trollope for the rest of his life.

In 1847, his first novel, *The Macdermots of Ballycloran,* was published, and it was followed in 1848 by the *Kellys and the O'Kellys,* both of which, as well as his next novel, *La Vendée* (1850), were pot-boilers. With *The Warden* (1855) Trollope started the series that made his fame, a group of novels whose setting was the imaginary cathedral town of Barchester in the imaginary county of Barset, and whose chief characters were clergymen of the Church of England, viewed socially rather than as religious figures, their failings looked at with sympathy and usually with good-natured amusement, their natural virtues and gentlemanly manners applauded. In addition to *The Warden,* the *Chronicles of Barset* consisted of the following novels: *Barchester Towers* (1857), *Doctor Thorne* (1858), *Framley Parsonage* (1861), *The Small House at Allington* (1864), and *The Last Chronicle of Barset* (1867). For the rest of his life, Trollope continued to pour out a continual succession of novels, short stories, travel books, and essays on an infinite number of subjects. His literary output was prodigious; but his fame still rests on his Barsetshire novels and some of his excellent novels dealing with the English political scene, the best of which are *Phineas Finn* (1869), *Phineas Redux* (1876), and *The Eustace Diamonds* (1873). Except for frequent trips abroad, many of them made for the English postal authorities, Trollope spent his creative years in England. He died in London on Dec. 6, 1882.

Trollope's *Autobiography* was published posthumously in 1883. His frank statement that he had written for money and had planned his literary production with mechanical precision was considered by many Victorians to cancel out anything that they had once thought great in him, and his literary reputation fell suddenly. In the twentieth century, however, a realization of his high reasonableness has substituted fame for Victorian popularity and has given him a secure place among the lasting English novelists.

J. H. W.

**TROMBETTI, ALFREDO** [trombe′tti] (1866-1929), Italian linguist, was born at Bologna on Jan. 6, 1866. Granted a stipend by the Municipio of Bologna, which enabled him to receive a doctoral degree in 1891, he taught in the *Licei* until 1904, when, after receiving a prize from the Accademia dei Lincei, he was appointed ordinary professor of Semitic philology in the University of Bologna. In 1921 he became a member of the Italian Academy.

Trombetti's scholarly efforts were directed almost exclusively toward discovering genealogical connections between the various linguistic families of the earth. In 1905 he published *L'unità d'origine del linguaggio,* in which he first presented his famous theory of the "monogenesis" of language, that is, the common origin of all the languages of the world. This theory, which occasioned violent polemics, was further developed in Trombetti's three-volume *Saggi di glottologia generale comparata* (1908-1920) and his *Elementi di glottologia* (1922-1923).

Judgments on Trombetti's work are generally extreme and are often vitiated by intense partisan emotions. He is regarded by some as a self-taught amateur, with more taste for rapid syntheses and broad generalizations than for the methodical and careful spadework of the well-trained scholar. There is no doubt, moreover, that his works abound in gross mistakes of every kind, which his critics were not slow to point out. However, some of his main ideas on the connection between languages (e.g., the relationship between Sandawe and Hottentot) have now been accepted by all, and it appears that others are gaining increasing favor. He did valuable work on the Algonquin and Bororoan languages, and his book *Saggio di antica onomastica mediterranea* (1925) is also important. Mussolini praised his studies in Etruscan, especially *La lingua etrusca* (1928), but these are among his weakest publications. Trombetti died at the Lido, Venice, on July 5, 1929.

G. B.

**TROMBONE** [trɒ′mbon; trɒmbo′n], a musical instrument consisting of two parallel metal tubes, one beginning in a cup-like mouthpiece, the other ending in a flaring bell; connecting the two is a sliding tube which shortens or lengthens the total length of the tubing, raising or lowering the fundamental tone together with the seven or eight overtones regularly obtained. The trombone is thus not only fully chromatic throughout nearly three octaves, but also, unlike any other wind instrument, it can easily produce a portamento, or "smear," from one end of its range to the other. Properly played, the trombone can be smoothly articulate as well as solemn and stentorian. In American popular music it croons and sobs, often with the aid of various appliances known as mutes, which may be stuffed in the lower end of the instrument to muffle or otherwise alter the tone.

Unlike other modern orchestral instruments, the trombone has changed very little in structure or manner of playing since it first appeared in Europe during the fifteenth century. For several centuries it was the only lip-blown wind instrument possessed of a complete chromatic scale, and for that reason it was important in art music when horns and trum-

pets were still chiefly military signal instruments. In church music, at court ceremonies, and in municipal bands the trombone was a valued instrument until the nineteenth century, when it lost its old position only to gain a new and permanent place in orchestral and military band music.

Like most other wind instruments, the trombone has been constructed at times in a variety of sizes, ranging in pitch from soprano to contrabass. In modern orchestras and bands, however, only the tenor and bass trombones are common. It is the tenor which serves on occasion as a solo instrument, and which has played an integral part in American popular music since the days of minstrel bands. Valve trombones, with valves replacing the slide, have been tried without lasting success. W. Li.

**TROMP, MAARTEN HARPERTSZOON** [trɔ′mp] (1597-1653), Dutch admiral, was born in 1597 in Brielle, South Holland. He went to sea as a boy and was captured by the British, who held him prisoner aboard ship for several years. On escaping he entered the Dutch navy and was made lieutenant admiral in 1637 and placed in charge of the fleet. In October 1639 he defeated a Spanish armada in the North Sea off Gravelines, France, in the Battle of the Downs. In the war which broke out between the Dutch Republic and England in 1652 he fought several battles with British fleets commanded by the admirals Robert Blake and George Monk. Tromp was worsted in the Battle of Portland on June 3, 1653, in which the British admiral William Penn also participated. Two more unsuccessful battles with the British in the Channel followed; in the latter engagement Tromp was shot in the heart and died on July 29, 1653. He was buried at Delft, where his marble mausoleum still attracts visitors. S. Van V.

**TROMPE L'OEIL** [trɔ̃′p lœ′y], literally *deceiving the eye,* the art of giving to objects depicted on a flat surface a convincing appearance of three-dimensional reality. It has been practiced ever since Classical times, giving rise to the old stories about fruits so well painted that birds tried to taste them. Seventeenth-century artists especially delighted in these trick representations, rendering books, papers, ribbons, and other objects in such a way as to give a vivid illusion of tangibility. Antonio Gianlisi in Italy, Wallerant Vaillant in the Netherlands, and Marcos Correa in Spain made *trompe l'oeil* paintings, as did also the nineteenth-century American, W. M. Harnett. Pierre Roy is one of the ablest of the twentieth-century exponents. M. Sa.

**TROMSÖ** [tro′msö], a fishing port, tourist center, and capital of Troms *fylke* (county) in northern Norway, 480 mi. northeast of Trondheim. Founded in 1794, Tromsö is on a 6-mi.-long island of that name in the Tromsösund, a fiord sheltered from the Arctic Ocean by the large islands of Kvalöy and Ringvassöy. The surrounding region is wooded to 1,500 ft., with the higher summits covered by ice and snow. Glacially eroded valleys bound high, steep-walled mountains, and the Midnight Sun is visible from May 21 to July 23. Tromsö, the world's most northern bishopric, has a wooden cathedral. It is the point of origin of many Arctic expeditions and contains an important Arctic museum. Smoked, frozen, and dried herring are prepared and exported, and brewing and shipbuilding are engaged in by the inhabitants. Pop. 1952, 11,070. J. E. V.

**TRONDHEIM** [trɔ′nhem], formerly Nidaros, historic city and commercial center and port of central Norway, capital of Sör-Tröndelag *fylke* (county) in central Norway. The city, the third largest in Norway, lies in a broad rolling basin with the Trondheimsfjord at its center. On the southern shore of the fiord, where the city is located, there are large areas of fertile farmland on raised marine terraces interspersed with rounded hills. At the effluence of the Nid River into the Trondheimsfjord, King Olaf I laid out the city of Nidaros ("Mouth of the Nid") in 997. It was expanded and patterned after contemporary English cities by King Olaf II (St. Olaf) in 1016 and was the capital of Norway until 1380. St. Olaf was buried in St. Clement's Church here. On this site was built the Cathedral of Nidaros, the destination of many pilgrimages during the Middle Ages. After the Lutheran Reformation in 1537, the city lost much of its importance, and many of its churches and monasteries were sacked and destroyed. Only in the mid-nineteenth century did the city begin to resume its former importance. Machine works, shipyards, and factories were built. Trondheim acquired new importance when the Constitution of 1814 required that the Norwegian king must be crowned in Nidaros Cathedral. For a time in the 1930's the official name of the city was changed from Trondhjem, which it had been called since the sixteenth century, back to the ancient Nidaros. This change was not popular and was soon given up. During World War II Trondheim was one of the points of invasion of the Germans in April 1940. After initial German landings, an Allied force of Norwegians, French, and British troops attempted to wrest control of the city from the invaders but were forced to withdraw northward to avoid being surrounded by German troops advancing from the south. During this period the city suffered some damage.

Trondheim has a rectangular pattern of wide streets with many stone buildings built as fire protection after the fifteen devastating fires which the city has suffered. The Cathedral, badly damaged during the Reformation and by subsequent fires, has been extensively restored since late in the nineteenth century. The sculptor Gustav Vigeland (1869-1943) did some of his early work on this project. On the Torv, the marketplace, is the Stiftsgaard, the largest wooden building in Norway, which is the king's Trondheim residence. In the southern part of the city is the Technical College of Norway, completed in 1910. The Norwegian Royal Academy of Science, founded in 1760, is located in the cathedral school. Surrounding the city are manufacturing suburbs. The harbor, with shipping and shipbuilding facilities, lies to the north of the low peninsula between the Nid and the fiord on which the city is built. In the east is the old fortress of Kristiansten. To the northeast the port has been enlarged to provide a sheltered, ice-free harbor which has steamship connections with all the Norwegian coast and serves as the beginning of most travel to the northern part of the country. Railways connect Trondheim with Sweden to the east through the low Storlien gap and with Oslo to the south over the high Dovre Railway or the lower Österdalen line. Pop. 1952, 56,377. J. E. V.

**TRONDHEIMSFJORD** [trɔ′nhemsfyɔrd], a broad depression located in central Norway at about 63° 30′ N. lat., the sea-filled part of a wide lowland which almost transects the highland of Scandinavia. To the east the Storlien gap offers a lowland route to the gently rolling plains of Sweden. The fiord, formed on soft Cambro-Silurian rocks and with rolling shores covered with glacial till, extends northeastward from the Atlantic Ocean for about 15 mi. to Agdenes, where it turns southeastward for 15 mi. to the city of Trondheim. There it turns northeastward again for the remaining 55 mi.

of its length. At its mouth south of Agdenes the Trondheimsfjord averages 2 to 3 mi. in width and has its greatest depth, 2,000 ft. In the central part of the fiord near Trondheim the width increases to nearly 16 mi. but the depth decreases to 1,380 ft., which it maintains to its head at Verdalsöra. The only major tributary fiord is the Beitstadfjord on the north, connected with the Trondheimsfjord through the narrow Skarsund, which extends northward about 15 mi. farther.

J. E. V.

**TROPIC BIRD,** any one of three species of medium-sized (32 in.) web-footed sea birds united in the genus *Phaëthon,* which is coextensive with the family Phaëthontidae. They are found in tropical and subtropical seas around the world. They have straight, heavy bills, long wings, and wedge-shaped tails which in adults have the two central feathers enormously elongated. Their plumage is white, marked irregularly with crescentic black bars, and often suffused with a salmon or roseate color. Tropic birds are usually seen far from land, flying at a height of 50 ft. or more above the water and plunging upon their prey of squids and fishes. Their strong flight resembles that of a pigeon. They breed on barren islands, depositing their single egg upon the open ground or in the shelter of a rock, without pretense of a nest. They are commonly known to seamen as boatswain birds, and in Bermuda as longtails. H. G. De.

**TROPISMS** [tro′pɪzəmz], movements of plants or animals in response to their surroundings. Almost any physical agent can cause a reaction in a plant, but the most pronounced responses are caused by light and gravity. Usually the plants bend towards or away from light or from the center of the earth. These curvatures are executed by the growing parts of the plant, and therefore they occur only in the younger parts of stems and roots, and in the leaf and flower stalks of young leaves and flowers. As soon as a stem or leaf stalk is full-grown, it loses the ability to bend and by that time it has reached its permanent position in space. Leaves of leguminous plants form an exception: bean and clover leaves can continue to move with the sun even when they are mature. They have special joints which retain their motility after the leaves are full-grown.

**Geotropism.** Tropisms are divided according to the agent which causes the response. Geotropism is the response of plants to gravity. When roots curve towards the earth, positive geotropism is evident; stem tips which curve away from the earth are negatively geotropic. The curvature of roots is not a mere sagging due to their weight, for in water or even in mercury their tips point downwards. Side roots and side branches are diageotropic growing at a certain angle with the vertical. The typical shape of trees is partly due to this diageotropic response of branches. The branches of the fir stand out horizontally; those of an elm point upwards. These angles are always about the same, regardless of whether the tree grows on a steep slope or not.

The geotropic response is very complex. When the stem tip is cut off, the rest of the stem becomes unable to curve. This led Darwin to suggest that the stem and root tips behave like brain centers, directing the movement of the parts below them.

Much research has been undertaken to discover the mechanism of this response to gravity. It occurs only in the growing parts of plants, and is due to differential growth of the two sides. Therefore the problem is how normal growth is changed under the influence of gravity. A stem grows in length due to small amounts of a growth hormone, auxin, which is formed in the stem-tip. This hormone moves from the tip to the region below; it is in this region that growth in length occurs, and nowhere else in the stem. As long as a negatively geotropic stem is growing upright, the auxin formed in the tip is evenly distributed over all sides of the stem below it, and therefore all sides grow evenly. But when such a stem is placed in a horizontal position, most of the auxin formed flows downward along the lower side, which makes the lower side grow more rapidly and the upper side facing up grows correspondingly more slowly. This difference in growth continues until the tip is pointing upward again, when auxin distribution becomes even, and growth of all sides continues at the same rate. Any deviation of the tip from the vertical causes uneven auxin distribution until the tip has righted itself again.

**Phototropism.** The response to light is called phototropism. Most stems are positively phototropic, as can be seen in plants growing behind a window and bending towards the light. Most leaves are diaphototropic, which means that they place themselves perpendicular to the direction of the light. In this way they are in a position to absorb the maximum amount of light.

Plants differ greatly in their sensitivity to light. In general, seedlings which have to penetrate the dark soil are most sensitive to light. Oat seedlings will curve towards a light which is so dim that eyes must be accustomed to darkness before it can be seen; a very short exposure to light of higher intensity also suffices. When oat seedlings have been grown in a room in complete darkness, a one hundred-watt bulb, from three to five feet away, needs to be turned on for only a second, to make the seedlings bend towards the bulb an hour later.

In many plants the phototropic stimulus is received by the stem-tip only. When the tip is cut off, or when it is kept in darkness while light shines on one side of the rest of the stem, the stem will remain straight. Therefore the place of perception of light is in the stem-tip. The curvature occurs lower down in the most rapidly growing part of the stem, which is about one inch below the stem-tip. This curvature does not start to appear until from one to two hours after illumination. Therefore it is apparent that after perception of the light in the stem-tip the excitation is slowly moving down the stem, and when it has reached the growing cells it causes the reaction. This resembles the reaction of animals to stimuli, where also the perception of the stimulus and the reaction to it occur in different parts of the body. In animals the excitation usually travels much more rapidly along nerves, which are not present in plants.

The transmission of the phototropic stimulus in plants is accomplished by auxin, the same substance which causes the geotropic curvature. When light shines on the stem-tip, from one side, the auxin formed in this tip is shifted towards the dark side. A greater amount of auxin travels downward along the dark side of the stem than on the illuminated side, and when that auxin reaches the growing zone about one hour later, differences in growth appear as a result of differences in the amount of auxin reaching the originally dark and light sides.

**Other Tropisms.** *Traumatotropism.* A curvature due to one-sided wounding of stems or roots is called traumatotropism. Stems usually bend towards the wounded side; roots bend away from it.

*Chemotropism.* A curvature of the plant root toward or away from chemicals in the soil is called chemotropism.

*Hydrotropism.* A curvature due to differences in water content of soils is called hydrotropism. Hydrotropisms, with chemotropisms, are responsible for the development of roots

into parts of the soil with favorable water and mineral content. These are also responsible for the penetration of sewers by tree roots.

*Haptotropism.* Most growing parts of plants are sensitive to touch. This sensitivity may be very great, as in tendrils, which wind around any solid object with which they may come in contact. The tendrils of members of the gourd family are especially sensitive, and on a warm day a few light touches on one side of a tendril will cause a haptotropic curvature within a few minutes.

**Nastic Motions.** Plant movements which are caused by changes in the external environment, but which are always in the same direction regardless of the direction of the stimulus, are nastic movements. The opening and closing of flowers are nastic movements, and best known of all are the sleep movements (nyctynasty) of leaves and flowers. During the night, the leaflets of clover, beans and other leguminous plants fold together, to open again in the morning.

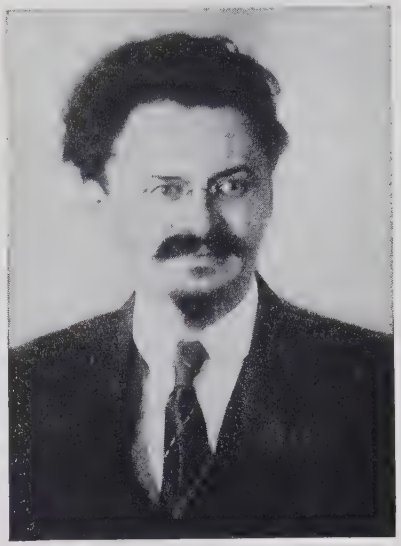
**TROPOSPHERE.** *See* METEOROLOGY.

**TROPPAU.** *See* OPAVA.

**TROSSACHS, THE** [trɒ'sæks], a mountain defile in the southwest of Perthshire, Scotland, extending from 1 mi. west of Loch Achray to Loch Katrine and flanked by Ben A'an, 1,750 ft., and Ben Venue, 2,393 ft. The gorge is described by Sir Walter Scott in his *Lady of the Lake* and *Rob Roy.* Its name in Gaelic means "bristled country." It is famous for its beauty during the summer and early autumn, when it attracts many sportsmen and tourists. S. Van V.

**TROTSKY, LEON** [trɔ'tskɜɪ; trɒ'tski] (1879-1940), Russian revolutionary, originally Leib Davydovich Bronstein, was born in the village of Yanovka, in the government (now the region) of Kherson, in the Ukraine, on Oct. 26, 1879, and was educated at the University of Odessa. He became a revolutionary and in 1898 was exiled to Siberia, where he met Georgy V. Plekhanov and Nikolai Lenin, both also in exile there because of their revolutionary activities. Trotsky escaped to France and returned to Russia in 1905, when he was exiled for life to Siberia. In less than three months he had escaped to Vienna, where he worked on the staff of the *Arbeiter Zeitung* and *Pravda.* When World War I broke out he went to Switzerland, where he wrote a pamphlet attacking the governments on both sides of the conflict. Consequently the German government, in his absence, condemned him to six months' imprisonment. In 1915 he went to Paris, where he edited the Russian Socialist weekly *Nashe Slovo,* in which he continued to assail the war. He was accordingly expelled to Spain the following year. From Spain Trotsky sailed, by way of Cuba, for New York City. He arrived there in 1917 and for a time was an editor of the Russian Socialist daily *Novy Mir.* Upon the outbreak of the Russian Revolution Trotsky returned to Europe. In Petrograd (now Leningrad) he established a weekly paper, *Vperiod,* and in November 1917 he became People's Commissar for Foreign Affairs. Later, after signing the Treaty of Brest-Litovsk (Mar. 3, 1918), he resigned and became head of the Department of the Army and Navy. After the death of Lenin in 1924 and the subsequent coming to power of Joseph Stalin, Trotsky was expelled from the Russian Communist Party (Bolshevik) on charges of obstructionism, and in January he was banished to Alma-Atka, in Kazakhstan. There he continued to assail the basic policies of Stalin, which had for their primary object the building of socialism within the U.S.S.R.; Trotsky believed instead in fostering revolution elsewhere throughout the world. On being expelled from the country in February 1929 Trotsky made his way to Turkey. In 1933 he went to France, and in 1935 to Norway. In 1937 he settled in Mexico City where, three years later, he was fatally attacked by a man believed to be named Ramon Mercader, who used a pickaxe for a weapon. Trotsky died the next day, Aug. 21, 1940. Among his



*LEON TROTSKY*

CULVER SERVICE

books are *The Defense of Terrorism* (1921), *Literature and Revolution* (1925), *My Life* (1930), and *The History of the Russian Revolution* (1932-1934). R. T.

**TROTWOOD, BETSY,** the dynamic aunt of David in Dickens' novel *David Copperfield,* who rescues David from his stepfather, Edward Murdstone, and provides for his education. DeL. F.

**TROUBADOURS** [tru'bədurz], medieval poets of southern France who composed light but often exquisite lyrics in the Provençal dialect, known as *langue d'oc.* They flourished during the twelfth and thirteenth centuries and used conventional standards established earlier, perhaps by clerks who were familiar with the Latin lyric. An Arab tradition, derived from the Moors who had formerly ruled Septimania, may also have had some influence. The troubadours, often but not always noblemen, sang their songs to their own accompaniment on a guitar or similar instrument. The first known troubadour was William IX, Duke of Aquitaine, eleven of whose lyrics survive. Some are delicate love-songs, others of a libertine nature. Bernart de Ventadour, unlike many of the troubadours, was of humble birth, but became one of the most famous writers of graceful love songs. Among the other troubadours of southern France were Jaufré Rudel, Bertrand de Born, and Peire Vidal. Although most of the songs concerned romantic love and the chivalrous knight, with a setting in beautiful scenes of nature, some had satirical themes. They reflect the more refined civilization of southern France, in contrast to the brutality of northern feudal society, which was depicted in the *chansons de geste.* After 1216 the southern movement declined, due to the Albigensian Crusade, which ruined the brilliant culture of that part of France. But in the twelfth century the fashion had spread to Spain, Sicily, England, and other countries, where kings and great lords bestowed their patronage on the troubadours. After the marriage of

Eleanor of Aquitaine to Louis VII of France, and then to Henry of Anjou, later Henry II of England, the courts of these kings became centers for famous *trouvères,* as the troubadours were called in the north. There they adopted the *langue d'öil* or northern dialect, and their poetry was dominated by *courtoisie,* in which chivalry was subordinated to the glorification of women. Lyric verse generally came to lack spontaneity and tended to grow increasingly stereotyped in a number of conventional forms, such as the *pastourelle,* the *alba* or dawn-song, and the spinning-song. *See also* Provençal Literature. F. C. H.

**TROUT,** important game fishes that are included with salmon in the family Salmonidae. They are distributed circumpolarly in arctic and temperate regions of the Northern Hemisphere. Characterized by soft-rayed fins, small scales, and an adipose fin behind the dorsal fin, trout occur in salt

COURTESY OF THE U. S. FISH AND WILDLIFE SERVICE

*EASTERN BROOK TROUT,* SALVELINUS FONTINALIS

and fresh water and in many cases both sea-run and landlocked populations of the same species are known. All species migrate upstream to spawn. There are two main groups, the chars and trouts, distinguished by the arrangement of the teeth and the shape of the vomer bone in the roof of the mouth. Among the many species of chars, two of the best known are the brook trout, *Salvelinus fontinalis,* of eastern North America and the Dolly Varden, *S. malma,* of the West. These fishes have both red and light spots on a dark body rather than red and black spots on a lighter background found in most *Salmo.* The large lake trout, *Cristivomer namaycush,* of the Great Lakes region and northward, is also a char. The other group of trout includes the steelhead, *S. gairdneri,* or rainbow, a native of the Pacific coastal area, and the brown trout, *S. trutta,* of Europe. Both have been introduced widely in the United States and elsewhere. In the Rocky Mountain region and westward there are other species. Some are of great beauty, such as the golden trout, *S. agua-bonita;* cutthroat trout, *S. clarkii;* and Yellowstone trout, *S. lewisi.* The eggs of trouts can be raised in fish hatcheries and so the fish have been widely distributed. Hybridization makes these fishes difficult to identify. Their beauty and splendid game qualities, as well as their excellent flesh, are praised by all. In many of the southern states the large mouth bass, *Huro salmoides,* and the weakfish, *Cynoscion regalis,* are called trout. Trout have been introduced in the southern hemisphere. The New Zealand and Chilean native trouts belong to a different family, the Galaxiidae. E. C. R.

**TROUT LILY.** *See* Adder's-Tongue.

**TROUVILLE** [tru'vi'l], a seaside resort in the Department of Calvados, northwestern France, 105 mi. northwest of Paris on the coast of Normandy at the mouth of the River Touques, which divides it from the adjoining community of Deauville. As late as 1830 Trouville was only a small fishing village, but thereafter its magnificent sandy beach began to attract visitors, until the promenade bordering it came to be called the "Summer Boulevard of Paris." The chief industry, besides the resort trade, is fishing, especially for oysters. Pop. 1954, 7,040. W. McE.

**TROVATORE, IL** [il tro'vato're], an opera in four acts by Giuseppe Verdi with a libretto by Salvatore Cammarano, derived from the Spanish *El Trovador* by Antonio García Gutiérrez. *Il Trovatore* ("The Troubadour") was first performed on Jan. 19, 1853, in Rome and is one of the most widely known and best loved of all Italian operas. It was written at the height of Verdi's middle period, when he was still chiefly interested in the emotional expressiveness of the voice and had not yet begun the more elaborate use of the orchestra which makes the operas of his old age so surprising and so interesting. The scene of *Il Trovatore* is laid in fifteenth-century Spain, and the plot, like that of *Rigoletto,* is the purest blood-and-thunder melodrama, incorporating the sure-fire elements of mistaken identity, a vengeful gypsy (Azucena, mezzo-soprano), a heroine who poisons herself for love (Leonora, soprano), a handsome young troubadour hero who believes himself the gypsy's son (Manrico, tenor), and a titled villain (the Count di Luna, baritone), who orders the execution of his hated rival Manrico, only to learn, too late, that he has caused the death of his own brother. S. C.

**TROY, SERGEANT.** *See* Sergeant Troy.

**TROY,** known also as Ilios, Ilion, or Ilium, an ancient stronghold in northwestern Asia Minor. Its name has acquired two senses. In the poems of Homer and his successors it means the fortress and city of Priam, which was sacked by Agamemnon and his army in the expedition that recovered Helen. To the historian and archaeologist it means the site of a settlement of the Bronze Age found and first excavated by Heinrich Schliemann in the nineteenth century. Each meaning has distinct associations. The two are inevitably interwoven, but the extent to which they may be equated has long been a matter of disagreement.

The region described by Homer and almost all other ancient writers on Troy is close to the mouth of the Hellespont (Dardanelles) and the coast of the Aegean Sea. In this region, ranges of low hills lie close to the shore, and behind them stretches a flat plain in which flow two small rivers, the Menderes and Dümrek; about three miles inland the ground rises in a steep scarp eighty feet high, beyond which a rolling plateau extends east and south to higher hills and mountains in the distance.

In ancient times the essential historicity of Homer's tale went unquestioned. But Troy was interesting to the ancients poetically, not archaeologically. Modern scholars before 1870, with other aims in view, went far toward dismembering even the poetry of the *Iliad* and *Odyssey,* and all but eliminated any thought of historical truth in the background of the poems.

Heinrich Schliemann, a self-educated German businessman, read Homer with enthusiasm and conceived a passionate belief in the fundamental truth of the stories. In 1870 he began to excavate a mound at the crest of the escarpment near the village of Hissarlik in Asia Minor, a few miles from the mouth of the Dardanelles. Here he found architectural remains in superposed layers, and a wealth of objects of stone, bone, ivory, copper and precious metals, quickly forcing the scholarly world to revise its

conclusions about the Heroic Age. Through accident he failed at first to recognize the layers of the Mycenaean or Late Bronze Age, but deep in the mound he came upon a much earlier citadel, chronologically the second, and confidently named it the city of Priam. After Schliemann's death in 1890 his colleague Wilhelm Dörpfeld continued the work, and Dörpfeld uncovered, in 1893 and 1894, the much more extensive circuit of the Sixth Settlement. This settlement was contemporary with much of the Mycenaean epoch, and was in turn accepted as the Troy of Homeric legend. More recently a minor revision of the dating has been made. Today a few still doubt the validity of archaeological evidence in questions of this kind, but most scholars believe the site at Hissarlik—the only mound of its kind in that region—to be the historical reality that was immortalized by the genius of Homer.

The physical remains themselves were re-examined in detail from 1932 to 1938 by an expedition of the University of Cincinnati under the direction of C. W. Blegen. As a result the strata have been more clearly differentiated, their chronology can now be set forth with greater accuracy, and general conclusions may be drawn.

Troy held a commanding position in the ancient world from a military and economic point of view. From its great fortress and a small outpost on the shore, sea traffic through the Dardanelles could be easily controlled and land routes between Asia and Europe could be supervised. The ruling prince might levy tolls or forbid passage altogether, and the conflicts in this region familiar in later history may well have begun early in the Bronze Age. The site was almost constantly occupied for 3,500 years. In the Bronze Age it was a citadel (in Greek, *πόλις*), not a city. The chieftain lived here with his family and retainers; much of the population lived in small settlements near by, withdrawing to the safety of the fortress only if threatened by enemies. Throughout this period cultural and economic relations were not with the East, but with Western, Aegean civilization, of which the Trojan was in some respects a part.

Most buildings at Troy had walls of crude brick which rested on low stone foundations. When they fell, the ruins were not cleared away but only leveled to make space for new houses. In this way a deep mass of debris grew up. Within it nine major layers can be distinguished, each with many minor strata. Characteristics of the various settlements may be summarized in the following classification:

**Troy I.** The First Settlement, built before 3000 B.C., was a small stronghold, not more than 100 yards in diameter. It had a massive wall of defense with gates and quadrangular towers, preserved even now to a height of 11 feet. Within were rectangular houses, one of which measured 22 by 60 feet. Ten successive phases of this settlement are observable, indicating a long period of occupation. The characteristic pottery is handmade gray or black polished ware. A stone stele with representation of a human figure in low relief provides the earliest example of monumental sculpture in this region. Implements of copper were used from the beginning.

**Troy II.** In the early part of the third millennium B.C. a larger citadel, some 400 feet in diameter, was built above the ruins of the first. This too had thick and lofty walls, projecting towers, and gates. A broad ramp with well-fitted flagstone paving led up from the southwest. The circuit was twice remodeled and expanded, evidently with the increasing power and wealth of the monarchs. A palace or megaron, with deep forecourt and a main hall measuring 33 by 66 feet, is partially preserved near the center of the citadel. Around it are a courtyard and smaller dwellings and storehouses. Seven phases of the Second Settlement are represented by superposed architectural remains. The last was destroyed, after the middle of the third millennium, by a general conflagration so intense that brick and stone were crumbled and calcined in its heat, and so sudden that the inhabitants left stores, household utensils, and valuables in their flight. Several treasures have been found, one of which comprised 3 diadems, 60 earrings, 8,700 beads, 6 bracelets, and 15 vessels of gold and silver. Throughout the settlement thousands of miscellaneous objects and pots of all sorts have come to light. The potter's wheel was introduced in the second phase of Troy II, and red and brown wares came to predominate over the earlier gray and black.

**Troy III-V.** After the destruction of the Second Settlement the site was immediately reoccupied. Settlements III, IV, and V, each larger in extent than its predecessor, carried on the main cultural tradition without interruption. They were composed of groups of small houses separated by narrow lanes. At some stages, perhaps always, there were circuit walls; but these were not so powerfully built as in Troy II, a fact which may indicate a relatively simpler and less aggressive political life. Bones of deer are found in great abundance in the deposit of the Third Settlement, marking either a new influx of this game or the invention of better methods of hunting, or both. The pottery shows a continuation and development of the styles of Troy II. Vessels with plastic representations of human features are common. With the local fabrics are found, as in earlier layers, imported wares characteristic of the Early Bronze Age on the Greek mainland.

**Troy VI.** The first phases of the Sixth Settlement were contemporary with the Middle Bronze Age in Greece (c. 1900-1600 B.C.). They are marked by the introduction of so-called gray Minyan pottery and the first appearance of the horse. After a long period of growth the site entered another phase of extraordinary wealth and power. By 1400 B.C. the citadel was well over two hundred yards in width, having a circuit wall 16 feet thick, composed of hewn stone and constructed in masterly style. At least three towers and four gates stood at intervals about its periphery. Within were concentric rings of substantial houses and palaces, rising on terraces toward the center of the hill (the upper levels of which are no longer in existence; *see below* Troy IX). The buildings of the Sixth Settlement were more pretentious than those of earlier periods; in several, pillars and column bases have been found. A cemetery of the latest phase of Troy VI, where ashes of the dead had been buried in urns, was discovered 550 yards south of the citadel. This era came to an end about 1300 B.C., in a violent earthquake which cracked the walls and shook down the superstructure of the buildings. The inhabitants rescued most of their valuables, however, and left no such array of utensils and ornaments as was found in Troy II. Gray Minyan ware was the predominant local pottery throughout the successive phases of Troy VI; it was supplemented by a few vessels imported from Greece in the Middle Bronze Age and many in the Mycenaean Age, especially in the period from c. 1450 to 1300.

**Troy VII.** After the earthquake the site was again occupied. The great circuit wall was used again, as were parts of standing walls and the many building blocks which lay plentifully at hand. Houses were now smaller, crowded together as if a greater population sought shelter within the fortress. Many large storage jars were set into the floors of the houses, presumably as a provision against shortages

in times of stress. The first phase of the Seventh Settlement, known as VIIa, was destroyed by fire about 1200 B.C., quite possibly after a long siege and final sack by an enemy. The coincidence of date and other evidence makes it seem probable that this was the actual destruction which came to be reflected in poetic legend. After the fall of Troy VIIa, some of the population returned and settled again on the hill, at first alone, later joined or temporarily subjugated by an alien people. The latter brought with them a rude handmade pottery, which is a characteristic mark of Phase VIIb and is believed to show European connections.

**Troy VIII.** The term Eighth Settlement covers the long period between the Early Iron Age and the establishment of the Hellenistic monarchs in Asia Minor. Troy now became a Greek town. Well settled in the first phases, it appears to have declined in the sixth century B.C., and part of the population may have abandoned the site. In any case it had little political importance. In a sanctuary on the southwest slope of the acropolis, sacrifices were performed, perhaps to Cybele; and there may also have been a temple to Athena at the summit. Corinthian and East Greek pottery has been found in large quantities, along with local wares of types descended in unbroken sequence from the Middle Bronze Age.

**Troy IX.** In the Hellenistic Age the site, known as Ilion, was unimportant except by its connection with the heroic past. Alexander the Great paid his respects here in 334 B.C., and the town was honored by his successors. They and the Julian emperors of Rome undertook extensive programs of rebuilding: the top of the hill was cut away and leveled (an operation which eliminated layers of the Eighth, Seventh, and Sixth Settlements, to the confusion of Schliemann and the regret of archaeologists in general); a temple and precinct of Athena were built there; public buildings were erected on the mound and on the plateau to the south, which was also surrounded by a wall; and a large theatre was built in the scarp to the northeast. Ilion was a thriving community to the time of Constantine the Great, who considered but rejected it as the site of his eastern capital. With the growth of Constantinople the town declined to insignificance.

J. L. C.

**TROY,** a city in southeastern Alabama, the county seat of Pike Co., situated about 45 mi. southeast of Montgomery, in a timber and farming area. It was founded in 1839 and incorporated in 1843 as a city. Troy is administered by a city commission. It is the home of a state teachers college. The city is served by the Atlantic Coast Line and the Central of Georgia railroads. Manufactures include fertilizers, crates, boxes, and other lumber products. The agricultural products of the area are cotton, corn, peanuts, and livestock. Pop. 1950, 8,555.

**TROY,** a city in eastern New York, the county seat of Rensselaer Co., situated on the east bank of the Hudson River, at the head of tidewater navigation and opposite the mouth of the Mohawk River, 6 mi. northeast of Albany. The State Barge Canal at Waterford nearby connects Troy with Canada. The Erie Canal, also at Waterford, gives the city a water route to Canada and to the states of the Midwest and Northwest. Troy is a manufacturing community and the center of the shirt and collar industry, producing about 80 per cent of the output of the entire country. The site of the city was settled by the Dutch under the Van Rensselaer Manor Grant of 1629. The townsite was surveyed in 1786, and Troy was incorporated as a village in 1798, the city charter being granted in 1816. Hannah Lord Montague invented a detachable collar for men's shirts in 1825, and Ebenezer Brown began their manufacture in 1829. Horatio Winslow purchased the right to manufacture and sell Bessemer steel and began production in his foundry in 1864, but Troy's activity as a steel center lasted only until 1873 when Andrew Carnegie built a steel mill near Pittsburgh, Pa. Samuel Wilson, a Troy brickmaker, opened a slaughterhouse at the turn of the nineteenth century. The city is the seat of Rensselaer Polytechnic Institute, established in 1824, the oldest engineering college in the nation; Russell Sage College; the Emma Willard School; and the La Salle Institute. Watervliet Arsenal is 1 mi. distant on the west bank of the Hudson.

Troy is served by the Boston and Maine, the Delaware and Hudson, the New York Central, and the Troy Union railroads and by river craft. Besides shirts and collars, manufactures include knit goods, men's clothing, iron and steel machinery, valves, stoves, auto parts, engineering instruments, coke, and brushes. Pop. 1950, 72,311.

D. D. M.

**TROY,** a city in western Ohio, the county seat of Miami Co., situated on the Great Miami River, 20 mi. northwest of Dayton. The New York Central and the Baltimore & Ohio railroads serve the community. Troy is the trading center of an area in which grain, fruit, and cattle are important. Manufactures include furniture, office equipment, gummed paper, airplanes, and welded products. Troy was first incorporated in 1814. The local government is administered by a mayor and council. Pop. 1950, 10,661.

**TROYES** [trwɑ′], capital of the department of Aube in northeastern France. It lies on the River Seine, which here divides into several arms, 85 mi. southeast of Paris. In Roman times the capital of a Celtic tribe called the Tricassi, Troyes escaped attack by Attila's Huns in the fifth century through the efforts of one of its first bishops, St. Loup, but was pillaged by the Northmen in 890 and 905. Becoming the capital of the Counts of Champagne in 1019, it grew to be an important trading center. Here in 1420, after Troyes had fallen into the hands of the Burgundians and the English, the Treaty of Troyes was signed, acknowledging Henry V of England as Regent of France, but in 1429 the city was freed by Joan of Arc. During the sixteenth century Troyes developed an important school of painters and sculptors.

The best-known products of Troyes are glassware, textiles and hosiery, and pork. It also manufactures casks, locks, knitted wear, and copper utensils and markets wheat, dried legumes, and wines. Pop. 1954, 58,819.

W. McE.

**TROYES, TREATY OF,** an agreement between Charles VI of France and Henry V of England signed at Troyes, France, May 21, 1420, during the Hundred Years' War. It was negotiated by Duke Philip of Burgundy following the assassination of his father, Duke John the Fearless, by a member of the Armagnac faction while John was attempting to bring peace between the two parties in face of the English conquest of Normandy. According to the terms of the treaty, Henry V of England was designated regent for, and successor to, Charles VI, who was mentally ill, the Dauphin being repudiated as the lawful heir. Henry was given the hand of Catherine, the French king's daughter, and control of northern France. Two years later both kings were dead, and the infant son of Henry and Catherine, Henry VI, was proclaimed king of England and France.

F. C. H.

**TROYON, CONSTANT** [trwa′yõ′] (1810-1865), French painter, was born on Aug. 28, 1810, in Sèvres near

Paris. Largely self-taught, he joined the landscapists of Barbizon in 1848. Here he found the subjects which were to remain characteristic of his work: landscapes with cows and sheep. Troyon's numerous paintings, once very highly rated, are in many European museums and in Boston, Brooklyn, Chicago, Cincinnati, Minneapolis, Montreal, New York, Philadelphia, Toledo, and in the Corcoran Gallery, Washington. He died on March 20, 1865. K. B.

**TRUBETSKOY, PRINCE NIKOLAI SERGEYEVICH** [trubyətskoi′] (1890-1938), Russian linguist, was born Apr. 16, 1890, in Moscow. The son of Prince Sergei Trubetskoy (1862-1905), professor of philosophy and rector of the University of Moscow, Nikolai Trubetskoy inherited a strong philosophical mentality, which he applied with far-reaching results to his linguistic investigations. Driven into exile by the Russian revolution, he joined with V. Mathesius and R. Jakobson in forming the "Prague school," which was to initiate one of the most fruitful trends of contemporary linguistics, the so-called structural study of language. His works *Zur allgemeinen Theorie der phonologischen Vokalsysteme* (in *Travaux du cercle linguistique de Prague,* vol. 1, 1929), *Anleitung zu phonologischen Beschreibungen* (1935) (*Travaux,* vol. 5), *Gedanken zum Indogermanenproblem* (*Acta linguistica,* vol. 1), *Grundzüge der Phonologie* (*Travaux,* vol. 7), and *Alphabet und Lautsystem* (*Slovo a stovesnost,* vol. 1) are of transcendent importance in modern linguistics. He was also a specialist in Slavic, Finno-Ugric and Caucasian languages, and knew thoroughly the literature, ethnography, folklore, and history of these peoples. His linguistic approach was at the same time historical and philosophical and gave his work a broad human outlook. Trubetskoy died in Vienna, June 25, 1938. G. B.

**TRUCE OF GOD,** the temporary cessation of all private warfare in feudal times on days determined by the Church. The penalty of disobedience was excommunication. It was first introduced by the Church in France in the eleventh century in an effort to limit unending and uncontrollable private feuds. The Truce of God first lasted from Saturday night to Monday morning, but gradually embraced feast days, and even the whole of Lent and Advent, until three-quarters of the year was included. The growing power of secular authorities finally enabled them to eradicate private warfare, and rendered obsolete the ecclesiastical Truce of God. F. A. F.

**TRUCIAL OMAN** [tru′shəl oma′n], also known as the Trucial States, a region extending 400 mi. along the southern coast of the Persian Gulf, bounded on the northwest by Qatar; on the west and south by al-Hasa and Nejd, Saudi Arabia; on the southeast by Oman; on the east by the Gulf of Oman; and on the northeast by Oman. It is composed of seven sheikdoms under British protection, including Abu Dhabi, Ajman, Dibai, Kalba, Ras al Khaimah, Sharja, and Umm al Qawain, and has a population of about 80,000 in an area of 6,000 sq. mi. Abu Dhabi and Dibai, both on the Persian Gulf, are the principal ports. The capital is Sharja (5,000), in the eastern end of the country, on the Persian Gulf.

Like Oman proper and al-Hasa, Trucial Oman consists of a wide interior desert plateau and narrow coastal plain. The rain is scant and the temperature high, but springs permit cultivation in the oases. Dates and sorghums are grown, and pearling is a rather profitable business along the coast. Most of the pearls are shipped to India. The former name, "Pirate Coast," indicates an earlier occupation of the sheiks.

In the nineteenth century, beginning with 1820, the various sheiks recognized Britain's authority, agreed to abolish piracy and slavery in the area, and promised not to cede territory to anyone and not to negotiate treaties with anyone except Britain. The British agent for the area resides at Sharja and is under the direction of the Persian Gulf Residency. H. C. K.

**TRUDEAU, EDWARD LIVINGSTON** [tru′do] (1848-1915), American physician and pioneer in the treatment of tuberculosis, was born in New York City, Oct. 5, 1848. In 1865, he entered a preparatory school at Newport, R. I., to study for appointment as midshipman in the navy. However, he left to nurse his brother, who shortly afterward died of tuberculosis. In 1868, Trudeau took up the study of medicine at the College of Physicians and Surgeons and qualified as house physician at Strangers' Hospital two months before he received his M.D. in 1871. In 1872 he became associated with Dr. Fessenden N. Otis. Trudeau's health failed the following year, the diagnosis being extensive pulmonary tuberculosis. After a brief stay at Aiken, S. C., he went to the Adirondacks, then spent the winter in Minneapolis, returning to the Adirondacks much worse. Basing his method on his self-treatment, Trudeau pioneered in the open-air treatment of tuberculosis, soon becoming recognized as the foremost authority on the disease and its treatment. The work of Herman Brehmer and Peter Dettweiler suggested the idea which led to Trudeau's founding of the Adirondacks Cottage Sanatorium in 1885, now Trudeau Sanatorium, which at his death had thirty-six buildings. In 1894 he founded the Saranac Laboratory, the first of its kind, for the study of tuberculosis. Trudeau had worked with tuberculin before Robert Koch published his discovery of it. He helped found St. John's-in-the-Wilderness and St. Luke's Church, Saranac Lake. He was a member of the American Climatological Association and Association of American Physicians (president, 1905) and president of the Congress of American Physicians and Surgeons, Washington, 1910. He was a founder and first president of the National Association for Study and Prevention of Tuberculosis, 1905. His honorary degrees were M.S., Columbia University (1899) and LL.D., McGill University (1904) and University of Pennsylvania (1913). He wrote several papers on tuberculosis for medical journals. He died at Saranac Lake, Nov. 15, 1915. His *Autobiography* was published one year later, in 1916. D. D. M.

**TRUE STORY, A,** by Lucian of Samosata (c. A.D. 120-180), a parody of the marvelous travelers' tales of his predecessors in Greek literature—poets, historians, and philosophers. Lucian gives his readers fair warning that only one of his statements is true, namely that what he will tell them is all lies. He describes how his ship, sailing westward through the Pillars of Heracles (Strait of Gibraltar), was caught up on the second day and carried along for seventy-nine days by a violent gale, and finally deposited by a whirlwind on the moon. Lucian fought valiantly in a war between the Moonites and the Sunites, but was taken prisoner. Returning to the Ocean, he and his ship were swallowed up by a whale; he escaped by lighting fires inside the whale, and then traveled to the Isles of the Blest and the Isle of Dreams. The book ends, after a visit to Calypso and the Donkey-legged Sirens, with what has been called the biggest lie of all—a promise to continue the story in other books. This entertaining satire has been the inspiration of many subsequent works, among them *Gulliver's Travels* and the tall tales of Baron Münchhausen. *See also* LUCIAN. C. M. D.

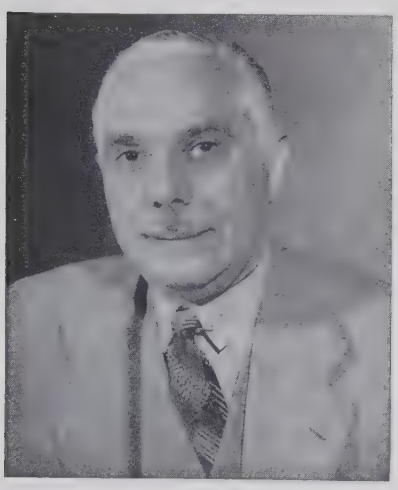
**TRUFFLE** [tru′fəl; trʌ′fəl], a genus, *Tuber,* of globose sac fungi usually found growing under deciduous trees, a foot or more below the surface of the ground. This genus includes many species native chiefly to Europe; some of them are edible, and these resemble mushrooms in their agreeable flavor. They vary from the size of an acorn to the size of a potato.

M. G. W.

**TRUJILLO** [truhi′yo], the principal city on the northern coast of Peru and capital of the department of La Libertad. It is an important commercial center and the outlet of a rich sugar-producing region. The exact date of the city's founding is unknown, but it was named in 1535 by Francisco Pizarro. Its streets and main plaza are reminiscent of a Spanish city, and many of the colonial mansions of the nobility still stand. Tourists and archaeologists are attracted by ruins of the pre-Incan Chimu civilization, whose capital, Chan-Chan, is 2 mi. from Trujillo. Traces of the old city walls, built as a defense against English pirates, remain. Salaverry, 7 mi. south, is the port for Trujillo. Pop. (est. 1947), 45,014.

S. G. I.

**TRUJILLO MOLINA, RAFAEL LEÓNIDAS** [truhi′yo moli′nɑ] (1891- ), Dominican generalissimo and dictator, was born in San Cristóbal, Oct. 24, 1891. After elementary schooling he worked in a telegraph office, then entered upon an army career. In 1927 he became a general and was given command of the national police. A revolt



*RAFAEL TRUJILLO MOLINA*

COURTESY OF THE DOMINICAN INFORMATION CENTER

forced President Horacio Vasquez from office in 1929, and Trujillo was elected president on May 16, 1930. He has since dominated the affairs of the Dominican Republic. He assumed the title of generalissimo in 1932 and remained president except for the interval 1938-1942 until his retirement in 1952, when his brother Hector Trujillo was elected to the presidency. Although Trujillo's authoritarian and sometimes violent methods aroused strong criticism at home and abroad, he is credited with much of his country's material progress. The Dominican capital, Santo Domingo, was renamed Ciudad Trujillo in his honor in 1936 after he had rebuilt and modernized it following the 1930 hurricane devastation.

S. G. I.

**TRUK** [tru′k], a cluster of twelve high, volcanic islands and many lesser islets, lying in a large lagoon girdled by a coral reef, in the Caroline Islands in the western Pacific Ocean (8° N. lat.; 152° E. long.). Its area is about 50 sq. mi. Before World War II Truk was reported to have a population of about 16,000. Mandated to Japan in 1920 by the League of Nations, it was subsequently transformed into a powerful air and naval base in defiance of the terms of the mandate. As such it served as one of the main springboards for Japanese advances south and east in the early months of World War II. Although shore installations and shipping in the harbor were heavily damaged or destroyed by American air attacks toward the end of the war, it was not occupied by United States forces until after the Japanese surrender in September 1945, the island having already been by-passed by American landings in the Marianas to the north. R. G. B.

**TRUMAN, HARRY S.** (1884- ), thirty-second President of the United States, was born on a farm near Lamar, Mo., on May 8, 1884, and grew up on a farm near Independence, Jackson Co., Mo. His middle initial, S, does not stand for anything, but was allegedly chosen because his parents could not decide whether to name him for his grandfather Shippe or for his grandfather Solomon. After going through high school in Independence, he sought appointment to West Point but was rejected because of a weak eye. Lacking funds for a college education, he went to Kansas City, Mo., where he worked at various jobs, enlisted in the Missouri National Guard, and became a bank clerk. From 1906 to 1917 he managed his father's 600-acre farm at Grandview, Mo. After his National Guard regiment was mobilized in 1917, he entered the Field Artillery School at Fort Sill, Okla., sailing for France in 1917 as a lieutenant. Truman was soon promoted to captain in Battery D, 129 Field Artillery Battalion, 35th Division, A.E.F., and returned to the United States a major in 1919, having participated in combat operations at St. Mihiel and in the Argonne offensive. He married Elizabeth Virginia Wallace on June 28, 1919, soon after his return. With an army associate he invested his savings in a Kansas City haberdashery, but this venture was a failure.

Discouraged by his lack of business success and without funds, he sought the help of friends. His farm background, his war record, his Masonic connections, his Baptist Church affiliations, and his genial personality recommended him to Thomas J. Pendergast, the political boss of Kansas City and much of western Missouri, and Truman was appointed Overseer of Highways for Jackson Co. In 1922 he was elected a county judge for Jackson Co., notwithstanding the fact that he was not a lawyer. To make up for this deficiency, Truman studied nights for two years at Kansas City Law School. In 1924 he was defeated for re-election, but in 1926 he was returned to office as presiding judge of the court, the duties of which also involved administrative supervision of many county expenditures, including $60,000,000 for public works. In 1934 he was elected United States Senator on the Democratic ticket. His first term in office was notable chiefly for his unsuccessful fight to prevent the renomination of Maurice Milligan for United States District Attorney for the Western District of Missouri; Milligan had obtained the conviction of thirty-five Pendergast "ward leaders" for vote frauds. During his second term Truman achieved wider recognition as the energetic and forthright chairman of the Senate committee investigating war contracts. Clashing at times with the policies of the Roosevelt administration, he effected considerable savings in government contracts, urged efficiency in war production and administration, and forced changes in the aircraft and ship construction programs.

In 1944, after Vice-President Henry A. Wallace had been rejected by the Democratic convention as a candidate for re-election, Truman supported James F. Byrnes of South Carolina for that office. Truman himself was nominated as

a compromise candidate, however, and he was elected. Upon the death of President Roosevelt on Apr. 12, 1945, Truman became the thirty-second President of the United States, pledging himself to carry out the domestic and foreign policies of his predecessor.

On April 25 his telephoned speech opened the San Francisco Conference establishing the United Nations Organization. A week later Germany surrendered, and from July 17 to August 2 Truman attended the Potsdam Conference with Winston Churchill and, later, Clement Attlee of Great Britain and Joseph Stalin of the Soviet Union. Then, having approved the atomic bomb targets selected by the Atomic Energy Committee, headed by Secretary of War Henry L. Stimson, he authorized the bombing of Hiroshima, Japan, Aug. 6, 1945, and Nagasaki three days later. After the Japanese surrender, Truman yielded to popular pressure and began the dismantling of the United States war machine.

In the months following World War II, Truman sought to retain price controls but yielded somewhat in the face of bitter popular opposition. He was also obliged to face postwar strikes, particularly those of the miners and the railroad workers, and for a time he was at odds with organized labor, though he regained its support by his later attempts to have the Taft-Hartley Labor Relations law repealed. Although he furthered bipartisan co-operation in foreign policy, his opposition to tax cuts, his insistence on price controls, and his alleged lack of aggressive support of labor programs resulted in a Republican majority in both houses of Congress after the elections of 1946. Gradually Truman created his own administration, which sponsored the "Fair Deal" as a label expressive of its goal in domestic affairs. One of the many cabinet changes of this period was the dismissal in 1946 of Henry A. Wallace, who had been made Secretary of Commerce in Roosevelt's fourth cabinet, because of his outspoken criticism of the administration's foreign policy. This policy was made concrete in the Truman Doctrine of containing Communist expansion by furnishing American aid to Europe and Asia, and particularly to Greece and Turkey. A corollary of this doctrine was the Marshall Plan, which was enacted into law as the European Recovery Program (E.R.P.) and led ultimately to the North Atlantic Alliance.

In 1947 Truman asked Congress for stand-by price controls, rationing, and bank and consumer credit control as parts of an anti-inflation program, but he was ignored. In September he attended the Inter-American Defense Conference in Brazil. To increase the efficiency of the executive branch of the government, he appointed a commission headed by former President Hoover which, after thorough study, recommended numerous changes, including unification of the armed services. In his State of the Union Message of Jan. 7, 1948, Truman called for rent control, social security, universal military training, national health insurance, and other social legislation. The next week he again asked for passage of his anti-inflation measures. On February 2 he asked for civil-rights legislation, including a Federal antilynching law, a Federal fair employment practices commission, a permanent civil-rights commission, and abolition of the poll tax—measures that enraged many Southern Democrats. Later in the year, he asked for a resumption of selective service and for an increase of $500,000,000 in the Export-Import Bank funds available to South America. On May 14, President Truman announced recognition of the new state of Israel, making the United States the first major power to do so.

As the presidential election of 1948 approached, Truman was given little chance for re-election, for his policies had alienated many of his own party. He was finally nominated by the Democratic Party, with Senator Alben W. Barkley of Kentucky as the vice-presidential candidate, but this action produced what seemed to be a fatal split in the party ranks. Henry Wallace, the candidate of the Progressive Party, was expected to divert many Democratic votes, and an even more serious threat was the defection of a large bloc of Southern

FABIAN BACHRACH

*HARRY S. TRUMAN, THIRTY-SECOND PRESIDENT OF THE UNITED STATES*

Democrats, popularly known as "Dixiecrats," offended by the strong civil-rights planks in the party platform. During his energetic campaign, Truman blasted the 80th Congress for its lack of action and held out promises of Federal support for housing, health, and social security. Other promises were for higher unemployment insurance payments, a national medical program, crop insurance, the continued subsidy of farm prices, and the end of segregation, especially in educational institutions. Before Congress adjourned, he had signed bills putting into operation the first peace-time draft and augmenting foreign aid. Truman's attractive programs, a switch of votes in the farm states, and the vigorous support of organized labor secured his unexpected re-election against weak, self-assured Republican opposition, and despite the split in the Democratic ranks.

During Truman's second term as president, he continued to press for civil-rights legislation, compulsory national health insurance, and other domestic measures associated with his Fair Deal program. In foreign affairs, he developed his Point Four program of aid to underdeveloped countries as one means of containing Communist expansionism. The increasing resistance to Communism was also evidenced by the creation, in 1949, of the North Atlantic Treaty Organization to superintend the integration of the military forces of its member nations in Western Europe. A further step was taken in 1951, with the establishment of

the Mutual Security Agency to co-ordinate American economic, technical, and military aid abroad.

In the meantime, the Communist invasion of South Korea in June 1950 and the consequent involvement of substantial American forces in the United Nations army of resistance produced a marked acceleration in American defense measures. Rearmament in the United States was enormously expanded, and the integration of European defense was given new impetus when N.A.T.O. accepted the President's nomination of Gen. Dwight D. Eisenhower as Supreme Commander of the North Atlantic Unified Defense Forces.

The President's dismissal of Gen. Douglas MacArthur in 1951 touched off a violent debate on American Far Eastern policy, and, on the political front, the discovery of scandals in the Reconstruction Finance Corporation and especially in the Bureau of Internal Revenue opened the Administration to sharp attack. After announcing in March 1952 that he would not be a candidate for re-election, Truman indicated his choice for the Democratic candidate to be Gov. Adlai Stevenson of Illinois. Truman actively campaigned for the election of Governor Stevenson, but a vigorous Republican campaign won the election for Dwight D. Eisenhower. Truman left Washington on Jan. 20, 1953, and settled in his home in Independence, Mo. There he devoted himself to the projected Harry S. Truman Library at Grandview, Mo., and to work on his memoirs; the first volume, *Year of Decisions,* was published in November 1955.

T. R. H.

**TRUMBULL, JOHN** (1750-1831), American poet and leader among the "Hartford Wits," was born at Westbury (now Watertown), Conn., April 24, 1750. His valedictory oration at Yale, entitled *An Essay on the Uses and Advantages of the Fine Arts* (1770), called for establishment of an American literature not dependent on models from abroad. His lively versified burlesque, *The Progress of Dulness* (1772-1773), which satirized contemporary men and collegiate manners, and two equally caustic series of essays, *The Meddler* (1769-1770) and *The Correspondent* (1770-1773), brought him into partisan controversy. Removing to Boston in 1773, he studied law with John Adams and was probably author of the popular and patriotic bombastic poem *An Elegy on the Times* (1774). He was already withdrawing by this time from the turbulence of literary give-and-take, so that although the first part of his mock-epic *M'Fingal* appeared in 1775, the work was not completed until 1782. Trumbull undoubtedly had some hand in *The Anarchiad* (1786-1787) and *The Echo* (1791-1805), occasional satirical attacks against democratic liberalism, but in general he withdrew almost entirely from public literary activities after the Revolution to devote himself to legal and political matters. He died at Detroit, Mich., May 12, 1831.

L. L.

**TRUMBULL, JOHN** [trʌ′mbəl] (1756-1843), American historical and portrait painter, was born at Lebanon, Conn., June 6, 1756. A graduate of Harvard College, he served in the Continental Army and later studied under Benjamin West in London. Trumbull's greatest achievement was a series of ambitious and detailed paintings of the outstanding events and personalities of the Revolution. Four of the series were commissioned by Congress for the rotunda of the Capitol. He was a founder and the first president of the American Academy of Fine Arts in New York City. He died in New York on Nov. 10, 1843. E. B. S.

**TRUMBULL, JONATHAN** (1710-1785), American Revolutionary statesman, was born Oct. 12, 1710, at Lebanon, Conn. He graduated from Harvard College in 1727, and was preparing to enter the ministry when family difficulties obliged him to enter his father's mercantile business. He then studied law, and in 1733 was sent to the General Assembly; in 1740 he was chosen assistant to the governor, serving until 1750. In 1766 he was made both deputy governor of Connecticut and chief justice of the Connecticut Supreme Court, and in October 1769 he was elected by the Assembly to the governorship, a position he held until 1784. When the Revolutionary War began, Trumbull was the only colonial governor to side with the colonies. He was a frequent correspondent with General George Washington and helped supply materials to the Continental Army. One of his sons, Jonathan, Jr. (1740-1809), also became governor of Connecticut, and another, John (1756-1843), became famous as a painter. Trumbull died Aug. 17, 1785, at Lebanon.

W. E. A.

**TRUMPET,** a general name for lip-blown musical instruments which have long, narrow, and relatively straight tubes, in contrast to the more curving conical tubes associated with the horn. Trumpets originated in the hollow branches and shells used by primitive peoples at an early stage to give their voices an unnatural, awe-inspiring quality, and later to sound fierce blasts carrying a magical significance. Not until man learned the use of metal, however, could he produce typical trumpets with long, straight, narrow tubes and piercing tones. Such trumpets were known to ancient civilizations from China to Rome; often pairs of extremely long instruments were employed, alternating in the production of two or three tones. In addition to serving in religious rites, these trumpets often figured as military instruments, and in Asia they came to be associated, like the large kettledrums, with persons of rank and nobility.

In Europe, use of the trumpet declined with the disintegration of Roman civilization, but eventually it was inspired anew through European contacts with the Islamic world during the Crusades. With the instrument itself came its military and aristocratic associations, with the result that it was several centuries before the trumpet became important in concert music as well as in military music. By about 1500 the tube had been lengthened and folded into its present oblong shape for convenience, and the all-powerful trumpeters' guilds had come to be made up of two very different types of players: field trumpeters who performed military calls and flourishes "by ear" in the lower and middle registers; and chamber trumpeters, skilled musicians who read and played complex parts in the difficult upper register. This brilliant style of melodic trumpet playing, achieved on natural trumpets by means of the lips alone, reached its peak at the time of J. S. Bach (1685-1750). With the rise of homophonic music in the latter half of the eighteenth century, the trumpet remained in the orchestra chiefly as a rhythmic and color instrument, like the kettledrum.

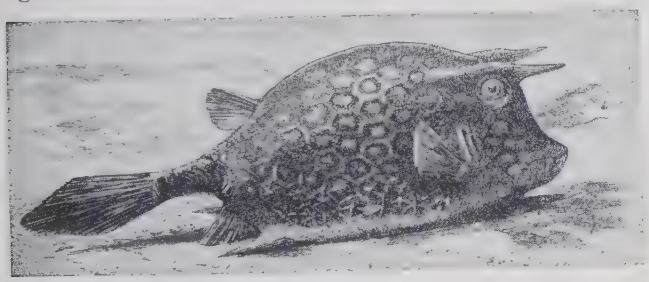
The nineteenth century, however, saw the renascence of the trumpet, made possible by the introduction of a valve or piston mechanism for obtaining all tones of the chromatic scale. Military bands were the first (c. 1820-1840) to utilize the many varieties and pitches produced by experimenting designers, but by 1850 or 1860 a pair of trumpets was found in most symphony and opera orchestras. Richard Wagner and his followers used alto, tenor, bass, and even contrabass trumpets, but today only the soprano, in B-flat or A, is common. Its brilliantly penetrating tone, less soft and blending than that of the "Bach trumpet," less mellow and flexible than that of the modern cornet, is at home in band, orchestra, and especially in American popular music. W. Li.

**TRUMPET TREE,** a large-leaved tree, *Cecropia peltata,* of the mulberry family, native to tropical America. It has hollow stems and branches, used for making wind instruments, and a milky juice somewhat like rubber. The strong fibrous bark is made into cordage, and the Indians made fire by friction of this bark against harder woods. A peculiar feature of this tree is colonies of ants that live inside the hollow stems and, in return for shelter and food, protect the tree from attacks of leaf-cutter ants. J. C. Wis.

**TRUMPET VINE,** a deciduous woody climber, *Campsis radicans,* of the bignonia family, also known as the trumpet creeper. Native to woods from New Jersey to Iowa, and south to Florida and Texas, the trumpet vine is the state flower of Kentucky. It is cultivated for its handsome orange to scarlet flowers, which are trumpet-shaped, about 3 in. long, and borne in a large terminal cluster in midsummer. The vines may climb to a height of 40 ft., clinging by means of aerial rootlets; the leaves are opposite and pinnately divided, and the long fruit pods contain numerous flat seeds with transparent wings. The Chinese trumpet vine, *C. grandiflora,* is an even showier plant, and when hybridized with *C. radicans* forms a fine hardy variety. J. C. Wis.

**TRUNKBACK.** *See* LEATHERBACK.

**TRUNKFISH,** small marine fishes of the family Ostraciidae that are encased in a bony box. The triangular-shaped body shell consists of six-sided plates which are fused together leaving openings only for the mouth, eyes, and fins.



TRUNKFISH

FROM WOOD'S *NATURAL HISTORY*

Some species have long horns over the eye and are called cowfish. About 20 species are found in shallow water of tropical seas. Four species of the genus *Lactophrys* are regularly found in Florida and the young are sometimes carried northward as far as Massachusetts by the Gulf Stream. They reach a length of 9 to 16 in. They swim slowly by a sculling motion of the dorsal and anal fins, and by the control of water jets from their gill slits. The tail fin usually acts as a rudder. They are good food fish, usually baked whole in the shell. E. C. R.

**TRUNNION, COMMODORE** [trʌ′nyən], Peregrine's generous, plainspoken guardian in Tobias Smollett's novel *The Adventures of Peregrine Pickle.* Until he marries Peregrine's Aunt Grizzle, he maintains shipboard customs on a country estate. R. M. W.

**TRURO** [tru′ro], the county town of Colchester Co., Nova Scotia, Canada, 62 mi. north of Halifax, situated on the Salmon River near its entrance into Cobequid Bay. It is the hub of land transportation in Nova Scotia. Radiating from it are the lines of the Canadian National and Dominion Atlantic railways and Provincial Highways 2, 4, and 11. The site of an Acadian settlement known as Cobequid, destroyed in 1755, Truro was resettled by fifty-three New Hampshire families in 1761. The town was incorporated in 1876. Near by are large areas of diked tidal lands. Dairying is important in the surrounding agricultural district. Local industries produce woolen underwear, hosiery, cloth, hats, shirts, lumber, builders' supplies, and dairy products. The first milk-condensing plant in Canada, established in 1885, was still in operation in 1952. In Truro are located the Nova Scotia Agricultural College and the Provincial Normal College. In the vicinity is Victoria Park. Pop. 1951, 10,756. D. F. P.

**TRUST,** in law, a fiduciary relationship created either expressly or by operation of law, in which one or more persons, called trustees, hold legal title and control of property or a property interest subject to an obligation to deal with the trust properly for the benefit of another or others, called the beneficiaries or *cestuis que trustent.*

**The Use.** Trusts are said to have been introduced into England following the Norman Conquest, and a form of trust known as a "use" became a common form of ownership of land. The use was a device which, under highly formalized early English law, served the purpose of enabling the beneficiary of the use to escape various responsibilities and burdens attached to the ownership of legal title to land. The Statute of Mortmain, in 1217, prohibited the conveyance of land to religious orders. This disability was circumvented by conveyance to a religious-minded individual, who permitted the ecclesiastical body to use the property as its own.

The Statute of Uses, enacted by Parliament in 1534, enumerated in its preamble the abuses and evasions of law which the use engendered, and ordained that legal title to land should be deemed vested in the beneficiary of the use. The Statute of Uses was interpreted by the courts not to be applicable to conveyances to trustees, upon whom were imposed active duties of management, or to trusts of personality.

**Express Trusts.** In modern times, express trusts in real property, securities, or funds, are commonly created by will and are known as testamentary trusts. Express trusts may also be created during the lifetime of the owner of property by its conveyance to trustees for the benefit of the intended *cestui que trust.*

A typical express trust requires the trustees thereof to receive the income of the corpus of the trust and to apply the net yield to the named beneficiaries until the termination of the trust period and provides for the distribution of the principal upon such termination.

In the absence of statutory provision establishing other requirements, it is generally held that an indestructible trust must be limited to a period of lives in being and twenty-one years, at the expiration of which time the trust property must be distributed. In New York State, absolute ownership and right to possession of those entitled to share in the distribution of trust property at its termination, its "remaindermen," must rest within a period which shall not be longer than the duration of the lives of two specified persons living at the time of the death of the testator, in the case of testamentary trusts, or at the date of conveyance to trustees where the trust is created by deed.

However, charitable trusts, as distinguished from private trusts, are generally not subject to limitation of this nature.

**Constructive Trust.** "Constructive trust" is the designation given to a trust imposed by operation of law on the ground of public policy, so as to prevent unjust enrichment and betrayal by a person in whom special confidence is placed in consequence of relationship or status. For example,

although an oral promise to reconvey real estate upon demand is enforcible under the Statute of Frauds, which requires that such agreement be in writing, nevertheless, if the promise of reconveyance be made by one spouse to the other, or by a son or daughter to a parent, the relationship of trust and confidence implicit in the situation will induce a court of equity to enforce the promise of reconveyance as a constructive trust.

**Resulting Trust.** When a person purchases real estate with his own funds, but directs the seller to execute the deed to a third person, courts of equity traditionally have recognized the presumption that the person who thus paid the consideration for the property did not intend a gift to the one in whose name the deed was taken, but instead intended that the property be held by the latter for the benefit of the former. Giving effect to such presumption of intention, courts of equity, in the absence of statutes requiring a different decision, generally hold that a "resulting trust" arises in favor of the person paying the consideration (unless this presumption of intention can be rebutted), and the nominal grantee is required to convey the property at the direction of the beneficiary of the resulting trust. In New York, and a few other states, this type of purchase-money resulting trust has been abolished by statute. H. Si.

**TRUST, INVESTMENT.** *See* INVESTMENT TRUST.

**TRUST COMPANIES.** *See* BANK FUNCTIONS AND OPERATIONS (*Special Services and Functions*); BANKING LAWS AND SUPERVISION (*Banking Laws*).

**TRUST RECEIPT,** a document evidencing the receipt of goods or securities by a person who does not have title thereto, and who agrees to return them, or to sell them and return the proceeds. Trust receipts are frequently necessary where banks make loans with securities or commodities as collateral. For example, when a bill of lading is held by a bank as security it usually must be released to the borrower in order for him to get possession of the goods or have them placed in a warehouse. A trust receipt is signed by the borrower and held by the bank until the borrower can substitute a warehouse receipt, or sell the goods and pay off the loan. Similarly, when a warehouse receipt is held by a bank it may have to be released in order for the borrower to process or sell the merchandise. The trust receipt gives possession of the goods to the borrower, but retains title in the bank. E. E. E.

**TRUST TERRITORIES.** *See* UNITED NATIONS.

**TRUTH,** the ideal perfection of knowledge. The kinds and degrees of failure to achieve this perfection constitute untruth.

The form of this idea which will inspire men's minds at a given time depends partly on what they most desire to know. Thus, for example, some, from Socrates onward, have sought moral truth by critical reflection upon ultimate human aspiration; medieval Christendom thought to attain religious truth by divine revelation reinforced by rational construction; modern man has concentrated increasingly on finding out the secrets of nature by empirical methods. What this variety has in common is the insight that truth can be reached only by bringing the mind into conformity with a reality which is independent of the will and desires of the knower.

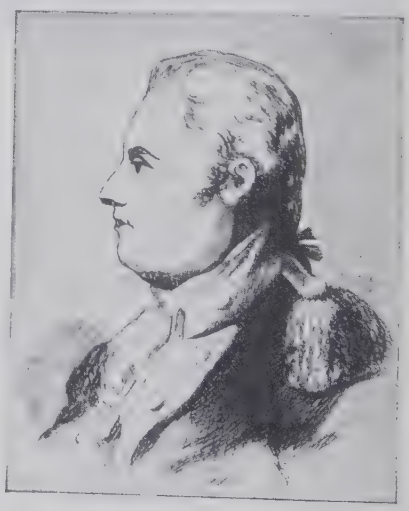
To specify this conformity more precisely in terms of a careful interpretation of the nature and methods of modern knowledge has been an important reflective task throughout the modern period. During the first half of the twentieth century three theories largely dominated the discussion, despite occasional significant dissent on behalf, usually, of some form of intuition (Bergson, Husserl). These theories may be characterized briefly as follows:

**Correspondence Theory.** A proposition is true if it corresponds to fact; false if it does not. Every proposition is thus true or false, even when it is not known to be true or known to be false. The relation of "correspondence" may be described as equivalence of formal structure of fact and formal structure of proposition, as in the case of a correct map. The test of truth must ultimately be a direct inspection of fact. As this is frequently impossible, much of our knowledge must be derived inferentially from propositions that can be tested directly.

**Coherence Theory.** Truth characterizes not propositions but knowledge, which is an achievement of logical inference and theoretical construction. Theory and fact interpenetrate, neither being external to the other, as the correspondence theory requires. The mind achieves truth in so far as its activities are controlled by the total logical tendency of available evidence. The ideal of coherence is thus a comprehensive system of judgment, every part of which implies and is implied by the whole. To be true, thought must be comprehensive, consistent, and necessary.

**Instrumentalist Theory.** Truth means neither correspondence to pre-existent fact nor coherence in an intellectually satisfying logical system, but successful guidance in action. However theoretical it may become, thought is still a tool or instrument produced by the organism to help it in practice. Ideas are regarded as essentially "plans of action"; the truth of an idea thus means its success in application, and its falsity means its failure. Ideas the acceptance of which would make no difference in practice are regarded not as false but as fanciful or meaningless. J. S. F.

**TRUXTUN, THOMAS** [trʌ′kstən] (1755-1822), American naval officer, was born near Hempstead, Long Island, N. Y., Feb. 17, 1755. He had elementary schooling and at the age of twelve went to sea. At fifteen he was impressed into the British navy and at twenty was master of a merchant vessel. In the American Revolution he became a privateersman and served on the *Congress,* the *Independence,* the *Mars,* and the *St. James.* He ranked fifth among the six captains in the new navy approved by Congress on Apr. 30, 1798. When the naval war with France began in 1798, Truxtun commanded the frigate *Constellation.* After two cruises he led a squadron of five ships stationed between St. Christo-



THOMAS TRUXTUN

COURTESY OF THE NEW YORK PUBLIC LIBRARY

pher and Puerto Rico. On Feb. 9, 1799, he won his first celebrated victory, over the French frigate *L'Insurgente*. French casualties were 70, American 3. This success won him great acclamation at home. In December, Truxtun sailed for the same station, in command of nine vessels. After a two-day chase, on Feb. 1-2, 1800, the *Constellation* engaged *La Vengeance* for five hours, silencing its much heavier batteries. As Truxtun prepared to board, his vessel lost its mainmast and the enemy escaped. He received the thanks of Congress and a gold medal, and was unquestionably the hero of the naval war. For the remainder of the hostilities he commanded the *President*.

In 1801 Truxtun, aboard the *Chesapeake*, commanded the second squadron against the Barbary Pirates, but in 1802 he withdrew from command, which meant his resignation from the navy. Truxtun set splendid standards for the young American navy. He wrote *Remarks, Instructions, and Examples Relating to Latitude and Longitude* (1794); *Instructions, Signals, and Explanations Offered for the United States Fleet* (1797); and *A Few Extracts from the Best Authors on Naval Tactics* (1806). He died in Philadelphia, May 5, 1882.

**TSALDARIS, CONSTANTINE** [tsɑlθɑ′ris] (1884- ), Greek statesman, was born in Alexandria, Egypt, in 1884. He studied law and political science at the University of Athens and, between 1904 and 1910, at universities in England, France, and Germany. Returning to Greece, he established a legal practice and was elected to the Greek parliament. He was appointed a minister in Crete in 1920, but after the establishment of the Greek Republic in 1924 he indulged in counterrevolutionary activities and was arrested in 1926, serving seven months of a three-year prison sentence. In 1932 he was again elected to parliament, serving until 1936, when he became under secretary of state in General Joannes Metaxas' cabinet. His underground work during the German occupation of Greece in World War II finally forced him into exile.

Returning to Greece after the war, Tsaldaris became influential in the adoption of a pro-Royalist policy by the Populist Party. When the party won a plurality in the March 1946 election Tsaldaris became premier, and largely through his efforts the 1946 plebiscite on the monarchy resulted in a victory for the Royalists. He was reaffirmed as premier by King George II on his return to the throne, but agitation for liberalizing reforms and representation of the minority parties in the Greek Cabinet led to Tsaldaris' resignation as premier in January 1947. In the coalition government formed by Demetrios Maximos, Tsaldaris became deputy premier and foreign minister, posts he continued to hold when Maximos was succeeded in September 1947 by Themistocles Sophoulis, Liberal Party leader. In September 1950 Tsaldaris became vice-premier.

**TSANGWU.** *See* Wuchow.
**TSARITSYN.** *See* Stalingrad (*The City*).

**TSARSKOYE SELO** [tsa′rskəyə syelɔ′], officially Pushkin, also called for a period Detskoye Selo (Children's Village), a resort town in the northern Leningrad Region of the Russian Soviet Federated Socialist Republic in the western Soviet Union, 16 mi. south of Leningrad. A Finnish village occupied the site in the seventeenth century, but when Peter the Great built Leningrad (then St. Petersburg) in the early eighteenth century he named the settlement Tsarskoye Selo and established it as a palace center. It remained a residence of the tsars until 1917, when Nicholas II and his family left there for exile. Under the Soviets the town became Detskoye (or Dyetskoye) Selo and later Pushkin, after the poet Alexander Pushkin, who was educated in the town. The great palaces and gardens were turned into resort establishments for children and workers. Occupied by the Nazis for over two years during World War II, these luxurious structures suffered enormous damage. The Catherine Palace or Great Imperial Palace was built between 1724 and 1756 in Baroque style and contained hundreds of magnificent halls, especially the famous Cameron Gallery and the beautiful chapel; gold, silver, mother-of-pearl, lapis lazuli, and amber were used lavishly in decorations. The Alexander or New Palace was built in the late eighteenth century. Surrounding the palaces were some of the most beautifully kept gardens, walks, and fountains in the world. All were ruined in World War II. The railroad to Leningrad opened in 1838 was the first laid in Russia, and electric lights were installed in 1887. Pop. (est. 1950), 50,000.

C. C. H.

**TSETSAUT.** *See* Indian Tribes, North American (*Western and Eastern Subarctic*).

**TSETSE FLY** [tsɛ′tsi], the name given to any member of the family Glossinidae, of the order Diptera. All the tsetse flies are of drab coloration, brownish or grayish. Their wings are tightly folded flat over their backs when at rest. The tsetse has a long proboscis, long parallel-sided palpi, and a stout arista on the third antennal segment differing from that of all other flies. The rays of the arista are restricted to the upper side, and each ray is plumose. African sleeping sickness, caused by *Trypanosoma gambiense,* is transmitted chiefly by *Glossina fusca* and *G. palpale,* while *T. rhodesiense,* causing a disease fatal to cattle and other animals, is transmitted chiefly by *G. morsitans.* Fossil tsetse flies have been found in America, and living specimens have been taken from airplanes arriving in South America from Africa. These flies are peculiar because their larvae develop to maturity, or nearly so, in the body of the mother before being deposited. Fortunately, they do not reach the adult stage unless the conditions are exactly right for their development.

**TSHI** or **TWI.** *See* African Peoples.
**TSIMSHIAN.** *See* Indian Tribes, North American (*North Pacific Coast*).

**TSINAN** [ji′nɑ′n], the capital of Shantung Province, eastern China, situated 221 mi. south of Tientsin and 410 mi. north of Nanking. It was founded in the reign of Emperor Great Yü (2205-2197 B.C.) of the Hsia Dynasty. The original site was about 25 mi. east of the present city, which was developed during the fourth century. Tsinan was among the first cities opened to foreign trade by imperial decree in 1904. Two years later a foreign settlement, Hsi Kwan, was established west of the city for foreign traders; it remains the business center of the community. In World War II the city was taken by the Japanese on Dec. 27, 1937, and in the Chinese Civil War the Communists took Tsinan on Sept. 19, 1948. Tsinan is both the administrative center and the leading industrial city of Shantung Province. It is also an important distribution point for agricultural products, and many industries are closely associated with agriculture. Numerous factories engage in silk reeling and weaving, cotton spinning, flour milling, and extraction of vegetable oils.

Shantung silk is world famous. Educational institutions include the American-endowed Cheelo University. Pop. 500,000.
A. C. T.

**TSINGHAI (CHINGHAI)** [tshɪ′ŋhai′], also known as Koko Nor, a west central province of China, bordered by Sinkiang Province on the west, Sikang Province on the south, and Kansu Province on the east and north. It is a vast grassland of 262,236 sq. mi., with a 1947 population of 1,346,800. The provincial capital is Sining. The inhabitants of Tsinghai are largely Chinese of the Han race. Mohammedans and Mongols are the minority racial groups.

**History.** The Mohammedans came to China from Persia and Afghanistan during the T'ang Dynasty (A.D. 618-907), and the Mongols reached Tsinghai after the invasion of Tibet by the Western Mongols at the end of the sixteenth century. The Mongols in Tsinghai Province are divided into two leagues, the Koko Nor East Wing League and the Koko Nor West Wing League, having 29 banners (basic political divisions). The dominant language in Tsinghai Province is of the Northern Chinese Mandarin System. The Mongols in the northern part of the province speak a language belonging to the Western Mongolia System. Tsinghai for centuries had been dominated by nomad tribes until the latter part of the Han Dynasty (206 B.C.-A.D. 220), when a province known as Szeping was established there. When the Mongols conquered China (A.D. 1368-1644), Tsinghai was put under the jurisdiction of Kansu Province. In the earlier years of the Republic the province was divided into the Sining and Tsinghai administrative districts. In 1928 the two districts were merged into one, known as Tsinghai Province.

**Topography and Climate.** Forming part of the Tibetan Plateau, Tsinghai has an average altitude of 4,000 ft. above sea level. The Kunlun Range stretches eastward across the province, constituting the watershed of China's two greatest rivers, the Hwang Ho and the Yangtze. The 2,700-mi. Hwang Ho rises from the Khotun Nor (lake), at the northern hill of Bayenkala Mountain, a part of the Kunlun Range in the southern part of this province. The 3,400-mi. Yangtze springs from the Tagh-Ulan Mountain on the Tsinghai-Tibet-Sinkiang border, then flows in a southeasterly direction to the south of Bayenkala Mountain. Amne Machin Mountain, on the Tsinghai-Szechwan-Sikang border, is a continuation of Bayenkala Mountain. Its highest peak reaches 24,600 ft., one of the highest peaks in the world. In the northern part of the province, beyond the Kunlun Range, is a lowland called the Tsaydam Basin, irrigated by the Tsaydam River, an inland waterway. Among the great number of lakes in Tsinghai, the Koko Nor (Mongolian translation of Tsinghai, meaning "blue sea") is the largest salt lake in China, 1,600 sq. mi. Fed by 72 streams, the Koko Nor is situated at approximately 10,500 ft. above sea level. The average temperature at Sining is 12° F., with a maximum of 58° in the summer and a minimum of 9° in the winter. The weather is bitterly cold in the winter, but the sky is clear during much of the time. People wear fur or felt all seasons of the year, including summer. The annual rainfall is about 12 in.

**Economic Resources and Activities.** Agricultural activities are limited to the eastern part of the province along the valleys of the Hwang Ho and its tributary, the Hwang. About 82,500 acres of land are irrigated by these two streams and by a network of small canals. The chief crops are barley, wheat, potatoes, beans, and hemp. The Chinese constitute the farming population. The Mongols are engaged in animal husbandry. The vast grassland on the mountain hills and the Tsaidam Basin make possible the raising of cattle, horses, hogs, and yaks on a large scale. A woolen textile industry is a recent development in this province. The salt water lakes are an important source of salt supply for the neighboring provinces, Kansu and Ningsia. The province has but one modern highway connecting Sining with Lanchow in Kansu Province. Ancient caravan routes link Sining with Lhasa in Tibet, Anhsi in Kansu Province, and Erhchiang Chochiang in Sinkiang Province.

**Cities.** Sining, the capital city, is the gateway to Sikang and Tibet. The exports from Sining are wool, fur, hides, cattle, and salt, while the imports are sugar, tea bricks, silk, cotton, and porcelain. The city has a population of 15,000. Southeast of Sining is located a rich lamasery, accommodating 1,500 lamas. Huangyuan, east of Sining and west of the Koko Nor, at the upper reaches of the Hwang River, is an agricultural center where the annual ritual of sacrifice to the Koko Nor is performed. Tulan, at the eastern part of the Tsaydam Basin, is a market place for the Mongols from the 29 banners.
A. C. T.

**TSINGTAO** [tshɪ′ŋdau′], the third largest Chinese seaport, situated at the southern base of the Shantung Peninsula in northeastern China. It is 390 mi. north of Shanghai and on Chiaochou Bay, which forms an excellent harbor. The city has a modified continental type of climate, with cold winters and warm summers. Beyond it are low, rugged mountains. The chief industries include cotton- and silk-spinning mills and plants for processing peanut oil and egg products. Tsingtao's buildings and municipal services are among the most modern in the Orient, and its attractive beaches draw many tourists. The city and its harbor were developed largely by the Germans, who occupied Tsingtao in 1898 and forced China to grant them a 99-year lease as indemnity for the lives of two murdered missionaries. The Japanese forced withdrawal of the Germans during World War I, and at the Washington Conference of 1922 the city was returned to China. The Japanese reoccupied Tsingtao in World War II, but it was again returned to China at the war's end. The city was severely damaged in the Chinese Civil War before the Communists captured it in February 1949. Pop. 537,400.
A. C. T.

**TSINKIANG.** *See* CHUANCHOW.

**TSIN LING SHAN** [tshɪn′lɪŋ shɑ′n], a mountain range of central China extending eastward from the high plateau of Tibet. It is immediately south of the Wei and Hwang Ho valleys. The Tsin Ling is an eastern extension of the great Kunlun Range and reaches 20,000 ft. in height at the western end, decreasing to about 3,000 ft. before leveling off into a plateau in western Honan Province. In eastern China the mountains are called Siungerh Shan and Funiu Shan. The range separates the northern and southern areas of central China and also forms a climatic, cultural, and economic divide.
J. E. F.

**TSITSIHAR (LUNGKIANG)** [tsi′tsihɑr, lu′ŋjɪɑ′ŋ], the capital of Nunkiang Province in Manchuria, situated in the fertile valley of the Nen River, a principal tributary of the Sungari. An important trading point on the route between Mongolia and the Soviet Union, the city controls the river traffic from Mergen (Nenchiang) in Heilungkiang Province down to Sanchaho, the junction of the Nen and the Sungari. From Sanchaho down, river junks and light launches from Tsitsihar can ply the Sungari as far as Kirin (Yungki) in Kirin Province. Tsitsihar is connected by a 143-mi. railway with Peian, the capital of Heilungkiang

Province, and by a 160-mi. railway with Taonan in Liaopei Province via Angangchi, which is on the western section of the Chinese Changchun Railway, formerly the Chinese Eastern Railway, from Lupin (Manchouli) to Harbin. Highways from Tsitsihar reach out to Heilungkiang and Hsingan provinces as well as to the lands of the Mongol tribes. The river port at Tsitsihar was opened to foreign trade by an imperial decree in 1906. Built by the Manchus in the sixteenth century, the city was originally divided into two sections, one exclusively for the Manchus and the other for the Chinese, Mongols, and Korean settlers. The Chinese who sought to stay in the city were compelled either to adopt Manchu language, Manchu dress, and everything Manchu or to forego any resentment against their rulers.

The dominating economic activities around Tsitisihar are agricultural. Wheat, soybeans, corn, millet, and kaoliang are produced in abundance, and the province (Nunkiang) has the reputation of being the "granary of China." Transshipment of agricultural products by railways and along the Nen also plays a principal part in the city's economic life. Pop. 1950, 60,376. A. C. T.

**TSU ISLANDS** [tsu], a group of small Japanese islands situated between Korea and the northwestern coast of Kyushu Island, Japan, at 34° 25′ N. lat. and 129° 25′ E. long. The islands lie in the center of Korea Strait and separate Chosen Strait from Tsushima Strait. The group consists of two main and several lesser islands. Their total area is 260 sq. mi. and the maximum elevation 2,130 ft. The most important town is Izuhara, on the east coast of Kami Island. In the thirteenth century Mongol hordes under Kublai Khan overran the islands before reaching Japan. In May 1905 the waters off these islands were the scene of the famous Battle of Tsushima, in which Admiral Heihachiro Togo's fleet routed the Far Eastern fleet of Russia in one of the decisive engagements of the Russo-Japanese War. R. G. B.

**TSUTSUGAMUSHI FEVER.** *See* Rickettsia.
**TSWANA.** *See* African Peoples.
**TUAREG.** *See* African Peoples.

**TUATARA** [tu′ɑtɑ′rɑ], sometimes tuatera, *Sphenodon punctatum,* sole survivor of an ancient order of reptiles, the Rhynchocephalia. Its lizardlike appearance hides many primitive structural features. Its sage expression is also deceptive, for its brain is scarcely larger than a pea. A striking peculiarity is the third, or pineal, eye on top of its head, possibly sensitive to light, consisting of a transparent scale, lens, pigmented retina, and well-developed nerve connecting with the brain through an opening in the skull. The thick-set, 2-ft.-long tuatara is olive brown or dull yellowish, and has a crest of enlarged scales along the back and tail: its name means "having spines" in Maori. After having survived for millions of years, the tuatara was speedily exterminated by civilization on New Zealand, and sheep threaten its extermination on the few inaccessible islets off the mainland where it shares its nesting places with petrels. It feeds upon insects, primarily, and lays hard-shelled eggs that take a year to hatch. M. G. N.

COURTESY OF THE AMERICAN MUSEUM OF NATURAL HISTORY

*TUATARA,* SPHENODON PUNCTATUM

**TUBA,** a name loosely applied to large, deep-toned, lip-blown musical instruments played with the aid of valves. Tenor, bass, and contrabass instruments of this type are made in a great many forms and pitches, and are given different names in different languages. The bass and contrabass tuba found in American orchestras are usually upright basses in the shape of a big cornet with the bell pointing upward; in military and concert bands the helicon bass, with circular tubing and bell pointing upward, and the sousaphone are more common. The sousaphone, a helicon bass coiled around the player, with a removable bell pointing straight ahead, was suggested by John Philip Sousa (1854-1932) as a means of securing a more powerful tone from the bass section of his band. W. Li.

**TUBATULABAL.** *See* Indian Tribes, North American (*Southwest*).

**TUBERCULOSIS** [tyubɜ′rkyulo′sɪs], a chronic infectious disease of man and animals, caused by *Mycobacterium tuberculosis* and characterized by formation in various body tissues of tubercles subject to caseous necrosis, with the resulting symptoms of fever, emaciation, and progressive loss of strength. The pulmonary form is also accompanied by cough, dyspnea, and hemoptysis.

**History.** Tuberculosis has been one of the scourges of mankind since ancient times. Throughout the centuries, it has been a chronic, world-wide, epidemic disease. The clinical picture was well known to the ancients and is excellently described in the writings of Hippocrates. The modern era in the history of tuberculosis began with the discovery of the tubercle bacillus by Robert Koch in 1882. The discovery of the X ray in 1895 by Wilhelm Roentgen was another landmark.

For reasons that are still not entirely clear, tuberculosis began to decline about the middle of the nineteenth century. In England and Wales the death rate dropped from 330 per 100,000 population in 1860 to 180 in 1900, and 60 in 1936. In the United States the death rate per 100,000 population fell from 181.8 in 1900 to 29.8 in 1949. Throughout most of continental Europe following World War II, there was a sharp rise in the death rate.

**Epidemiology.** Tuberculosis still remains a major health problem. At present, it is responsible for about one twentieth of all deaths and remains the chief cause of death from disease between the ages of 15 and 45 years. Tuberculosis occurs at all ages from infancy to old age; recent figures indicate an increase in the older age groups. In the United States the death rate among Negroes is about 2½ times the rate for whites. It is estimated that there are about 500,000 persons with active tuberculosis in the United States.

Tuberculosis spreads from one individual to another by

inhalation of air-borne particles of infected sputum. At one time, milk from infected cattle was a common source of infection, but this type has been almost completely eradicated in the United States, although it continues to flourish in other countries. Tuberculosis is not highly contagious; considerable contact must occur before active disease develops. Many people inhale tubercle bacilli, but the majority have sufficient resistance to destroy them. X-ray surveys of apparently healthy people show many with old, healed scars of tuberculosis; these individuals give no history of disease and are perfectly well.

Since inhalation is the common mode of infection, the lungs are the primary site of disease in the vast majority of cases. In the United States, pulmonary tuberculosis comprises about 95 per cent of all cases. However, the tubercle bacillus may invade all portions of the body, from skin to any of the internal organs; this occurs, usually, by spread from the lung infection. From the standpoint of public health, tuberculosis control is essentially control of pulmonary tuberculosis.

The tissue changes in the disease depend upon whether the individual has been previously exposed to tubercle bacilli. The first infection, of the primary or childhood type, represents the tissue reaction of an individual who has never been previously infected. Although more common in children, the primary type of infection is now seen at all ages. The initial site of disease occurs more frequently in the lower portions of the lungs. Characteristically, there is spread of the tuberculosis to the lymph nodes at the root of the lung. The first infection is usually benign and commonly undergoes healing without causing ill health. In infants, and occasionally in adults, the primary infection may progress to serious disease.

**Immunity.** The reaction of the body to subsequent infection is altered by the resistance built up as a result of the primary infection. Reinfection usually begins in the upper part of the lung and is frequently progressive, with cavity formation; there is no spread to the lymph nodes at the lung root. This is the common type of adult tuberculosis.

No completely effective antituberculosis vaccine had been developed by 1950. BCG (Bacillus Calmette Guérin), a vaccine which was first developed in France, has been widely used in continental Europe. This vaccine is composed of live bovine bacilli which have been attenuated by special methods. It confers partial and temporary immunity and cannot be relied upon to the exclusion of other measures; its use is primarily confined to those who are unavoidably exposed to active tuberculosis. BCG apparently confers the same order of immunity as a spontaneous primary infection.

**Diagnosis.** Since the method of spread of the disease is known, early recognition, with proper treatment and isolation, is the single most effective preventive measure. Pulmonary tuberculosis is usually an insidious disease, and there may be no symptoms in the early stages. As the illness progresses, such symptoms as chronic cough, weight loss, fatigue, hemoptysis, and night sweats develop. By the time definite symptoms have appeared, the illness is usually in a moderately or far advanced stage. Increased use of X-ray surveys of apparently healthy people leads to discovery of patients with minimal disease. In the unrecognized state, these individuals are a source of infection to their close associates.

Although it is of inestimable value, the X ray alone cannot always determine the activity of the tuberculous process. It will reveal the presence of lung disease, even of minimal extent. Subsequently, the determination of whether this disease is tuberculosis or nontuberculosis, active or healed, depends upon further examination, including studies of the sputum for tubercle bacilli.

The determination of sensitivity to tuberculin is also a helpful diagnostic test. A small amount of a material called tuberculin is injected into the skin. A positive result indicates that the individual has had a tuberculous infection. It does not indicate whether the infection is active or healed. The greatest value of the test lies in the fact that a negative result usually rules out the presence of tuberculosis.

**Treatment.** There is no specific cure for tuberculosis. The basis of all treatment is adequate bed rest; this is best carried out in a sanatorium where equipment and trained personnel have been gathered together. Geographic location of the sanatorium is of relatively little importance. The primary factors are adequate medical and nursing care.

A considerable percentage of patients, particularly those with minimal disease, will be cured by bed rest alone. Others, with more advanced disease, will require various types of lung collapse to aid in healing. More recently, in a small percentage of suitable patients, it has been possible to remove the diseased portions of the lung. In this manner, seemingly hopelessly ill patients have been restored to health.

During the last few years, several effective drugs have been developed. The best known of these is the antibiotic streptomycin. Others are para-amino-salicylic acid and the thiosemicarbazones. These drugs may produce toxic or disagreeable effects and should be administered under careful supervision. None of them is a cure-all for tuberculosis; they are valuable primarily as an adjunct to other well-established forms of therapy, such as bed rest and surgical methods.

**Rehabilitation.** The problem of rehabilitation is a most important one. Tuberculosis is a chronic, relapsing disease, and the danger of reactivation is always present, particularly during the first two years following discharge from a sanatorium. After the period of sanatorium care, the patient faces the problem of resuming normal life with all its responsibilities and strains. If this is done gradually, under medical observation, the chances are good that the patient will remain well. Adequate housing and good nutrition are also important factors. Co-operation between medical and social-service personnel is essential. Statistical studies indicate that good rehabilitation measures enable the former patient with arrested disease to resume a normal existence with an excellent prospect of remaining well. Rehabilitation facilities have not kept pace with the whole broad medical and social problem of tuberculosis, and much remains to be accomplished. H. R. N.

**TUBEROSE** [tyu′broz; tyu′bəros], a summer-flowering bulb, *Polianthes tuberosa,* of the amaryllis family, popular for its sweet-scented flowers. It is probably a native of Mexico, and is grown commercially in the United States as well as in Europe; but 80 per cent of the American crop (largely from North Carolina) is exported. The plant gets its name from the bulblike tuber, and grows from 2 to 3½ ft. high, bearing long, narrow leaves and large, waxy-white, double or single flowers, arranged in pairs on a terminal spike. G. M. Sm.

**TÜBINGEN, UNIVERSITY OF** [tü′bıŋən] (Eberhard-Karls-Universität), at Tübingen, Germany, founded in 1477 by Count Eberhard V of Württemberg. The reformed faith was accepted by the university in 1534, and three years later a Protestant Theological Seminary was established as one of the university's schools. Not until 1817 was a faculty of Catholic theology organized. The faculties in 1949 included evangelical theology, Catholic theology, jurisprudence

and political economy, medicine, philosophy, mathematics, and natural science. Several institutes are maintained by the university: the archaeological, which owns a collection of Egyptian antiquities as well as excellent Greek and Roman vases; and the geological and zoological exhibit, which houses the natural history collection, including valuable fossils of the Triassic and Jurassic periods. The university's library, founded in 1477, contained 612,000 volumes in 1947, including a particularly valuable collection on theology and the Orient. A. L. H.-Q.

**TUCANA** [tuke′nə], the Toucan (a tropical bird), a modern southern constellation, centered at right ascension, 23 hr. 40 min.; declination, — 67°. Though large, it is an inconspicuous group, with only one star sufficiently brilliant to be included in the third magnitude. Within its boundaries are the Lesser Magellanic Cloud, to the naked eye a hazy spot like a detached portion of the Milky Way, and the bright globular star cluster N.G.C. 104. J. H. P.

**TUCANO.** *See* INDIAN TRIBES, SOUTH AMERICAN (*Other Linguistic Groups and Tribes*).

**TUCHONE.** *See* INDIAN TRIBES, NORTH AMERICAN (*Western and Eastern Subarctic*).

**TUCKAHOE** [tʌ′kəho], a village in Westchester Co., in southeastern New York, 16 mi. north of New York City, of which it is a residential suburb. The village, settled before the Revolution and incorporated in 1902, is governed by a mayor and council. The New York Central Railroad serves the community. Although there is some light manufacturing, the principal industry in the village is a medicinal drug plant. Pop. 1950, 5,991.

**TUCSON** [tusɒ′n], a city in southeastern Arizona, the county seat of Pima Co., situated on the Santa Cruz River, about 110 mi. southeast of Phoenix. Tucson, a noted health and winter resort, is situated 2,376 ft. above sea level, surrounded by the Santa Catalina, the Tucson, and the Tanque Verde mountains. The climate is mild and dry, and even though the temperature rises above 100° F. during June and July the heat is bearable because of the low humidity.

The opening of the Mission San José del Tucson in 1768 on the city's site marked the founding of Tuscon, whose area was included in the territory acquired by the United States by the Gadsden Purchase in 1853. The small community was garrisoned, and in 1856 it was the scene of a convention that petitioned Congress for the right to organize the Territory of Arizona, which was formed in 1863. In 1862 Confederate troops occupied the town. From 1867 to 1877 Tucson served as the territorial capital. It was incorporated as a town in 1877 and chartered as a city in 1883, the charter being amended in 1929. A mayor, council, and city manager administer the city.

Educational institutions located in Tucson include the University of Arizona, a state school for the deaf and the blind, an Indian school, and numerous private schools. Exhibits of interest may be found in the Arizona State Museum, the Carnegie Library, and the cactus garden on the university's campus. The Carnegie Institution of Washington maintains a botanical laboratory in the city, and the United States Bureau of Mines has an experimental station there.

The district's scenic features include Saguaro National Monument, Tucson Mountain Park, Sabino Canyon, and Colossal Cave. The ruins of Fort Lowell are situated 8 mi. northeast, and near by are the restored San Xavier del Bac Mission, the Casa Grande Monument, and several Indian villages.

EWING GALLOWAY

*THE COURTHOUSE IN TUCSON, ARIZONA*

Transportation facilities are furnished by the American Airlines and the Southern Pacific Railroad, which maintains extensive repair shops in the city. There is little manufacturing carried on in Tucson, which is the wholesale distribution center of the area and the shipping point for the region's livestock, citrus fruits, and cotton. Pop. 1950, 45,454. S. D. M.

**TUCUMÁN** [tu′kumɑ′n], a city of northern Argentina and capital of Tucumán Province, situated on the Soli River about 680 mi. northwest of Buenos Aires. Tucumán is Argentina's chief sugar-producing center and its largest city north of Córdoba. It was founded in 1565 and developed as a typically Spanish town, with low, thick-walled houses built around inner courts. It was here, in 1816, that the first Congress of the Republic was held and Argentine independence was proclaimed. Pop. 1947, 152,508. S. G. I.

**TUCUMCARI** [tu′kəmkɛ′əri], a city in northeastern New Mexico, the county seat of Quay Co., situated 165 mi. east of Albuquerque, at 4,100 ft. above sea level. In 1901 the Chicago, Rock Island and Pacific Railroad ended beside a construction camp near Tucumcari Mountain, and a settlement was founded which was made a division point for the railroad. Quay County was organized in February 1903, and Tucumcari became the county seat. The local city government is administered by a council and manager. The primary occupation of the inhabitants of the region has been ranching. To develop the surrounding semiarid lands so that farming would be profitable, the United States Government in 1938 established the Tucumcari Project, an irrigation program, under the Bureau of Reclamation. It was estimated that 45,000 acres of land would be served by the Conchas Dam, 35 mi. northwest on the Canadian River, which was completed in 1939. The Bureau of Reclamation maintains offices in Tucumcari and operates a demonstration farm near by. The city is the shipping and retail trade point for the district. Its chief industrial establishments are the shops and yards of the Chicago, Rock Island and Pacific and the Southern Pacific railroads. Pop. 1950, 8,419. S. D.M

**TUDOR,** the name of a family of Welsh descent, five members of which occupied the English throne. Owen Tudor became Clerk of the Wardrobe to Catherine, the widow of Henry V. Whether he ever legally married her is doubtful, but they had five children, of whom the eldest, Edmund

(c. 1430-1456), was created Earl of Richmond in 1453 by his half-brother Henry VI. Edmund married Margaret Beaufort, daughter of the Duke of Somerset, and his only son, Henry (1457-1509), defeated and killed Richard III in 1485, and ascended the English throne as Henry VII. His hereditary claim to the crown was very slight, but he was declared legal king by Parliament. His son Henry VIII (1491-1547) was empowered by Parliament to leave the throne by will, and under it his three children, Edward VI (1537-1553), Mary (1516-1558), and Elizabeth (1533-1603) succeeded in their natural order. With Elizabeth's death without heirs, the throne passed to James Stuart, King of Scotland and descendant of Margaret, the eldest daughter of Henry VII.

E. R. A.

**TUDOR STYLE.** *See* ARCHITECTURAL STYLES.

**TUESDAY,** the third day of the week. In the Roman calendar the corresponding day was *dies martis,* and the same reference to war is conveyed by the origin of Tuesday. Tiw's day is derived from Tyr or Tir, the wrestler and the son of Odin, or Woden, the Norse god of war. According to the Edda, Tyr is a one-handed god. The gods devised a plan whereby the wolf Fenris could be captured by means of Gleipnir, a chain as smooth and soft as a silken string. The wolf consented to be bound only on the condition that one of the gods put his hand in Fenris' mouth as a pledge that he would be released. Tyr alone had courage enough to submit his hand. But when Fenris found that he could not break the cord and that the gods refused to untie him, he bit off Tyr's hand. The Talmud lists Tuesday as a lucky day because the third day of creation is described as: "God saw that it was good." Among the Hindus it is, together with Saturday and Sunday, an unlucky day on which no important business or long journey may be undertaken. In Greece and Albania it is also an unlucky day on which all kinds of enterprise are forbidden. In some Christian circles Shrove Tuesday, the last day before Lent, culminates a long series of carnival events. Special delicacies are prepared, as in Belgium and Great Britain, where the day is known as Pancake Day. It is celebrated by the British with cock-fighting, football, and throwing pancakes. In Northumberland and Scotland the day is called Fastern's E'en (Eve of Fasting), and elsewhere as Rope Pulling Day or Shuttlecock Day. Estonians serve a special Shrove Tuesday soup (pig's feet and dried peas or lima beans). Among the Finns it is a school holiday and pancakes are a featured dish. Among the French, Shrove Tuesday is the Mardi Gras carnival honoring the Fat Ox. Roman Catholics in the Netherlands observe the day with merrymaking and feasting. The chief delicacy is *worstebrood,* a hard-crusted bread with a center of spiced sausage meat.

A. L. H-Q.

**TUFA** [tu′fə], a highly porous calcareous spring deposit. It has the same origin as the more compact travertine. The term "tufa" has been used for siliceous as well as calcareous spring deposits, but most petrologists prefer "siliceous sinter" for such material. Tufa has also been confused with tuff, which is composed of pulverized volcanic ejecta. The outstanding locality for calcareous tufa in the United States is in the terraces at Mammoth Hot Springs, Yellowstone National Park.

K. K. L.

**TUFF,** the name applied to consolidated deposits of volcanic ash and other fine volcanic ejecta. The word "tufa" has been used as a synonym, but its usage should be confined to spring deposits. Most tuffs accumulate under water, so this material may be both igneous and sedimentary. Tuff is a light-colored, fine-grained, friable rock, usually visibly stratified. If coarser ejecta are present, the rock may be called an agglomerate or volcanic breccia. Tuffs are given various names, such as rhyolite tuff or andesite tuff, depending upon the character of the original magma. Sedimentary tuffs may contain intermixed nonvolcanic material; calcareous tuff (which may be fossiliferous) is an example of this mixing.

K. K. L.

**TUFTS COLLEGE,** an accredited, coeducational, nonsectarian, privately controlled university, on a 200-acre campus in Medford, Mass., 5 mi. from the center of Boston. The Medical and Dental Schools are in Boston. The charter was granted to the School of Liberal Arts in 1852, through the efforts and support of members of the Universalist Church. First instruction was given in 1855. Additional divisions were founded as follows: Engineering School, including the Bromfield-Pearson School, 1865; School of Religion, 1869; Graduate School, 1878; Medical School, 1893; Dental School (established as Boston Dental College in 1868), 1899; Jackson College, the school of liberal arts for women, 1910; Fletcher School of Law and Diplomacy, 1933; and Division of Special Studies, 1939. Affiliated with Tufts is the Bouvé-Boston School of Physical Education, the Boston School of Occupational Therapy, the Nursery Training School of Boston, the Museum School of the Boston Museum of Fine Arts, and the Forsyth School for Dental Hygienists. Through a co-operative program arranged by Tufts College and the Harvard Law School, law students at Tufts take a seven-year course leading to the A.B. and the LL.B. degrees.

Degrees offered are the A.B., B.S., B.S. in engineering, M.A., M.S., M.Ed., M.A. in law and diplomacy, M.D., D.M.D., and Ph.D. Navy and Air Force R.O.T.C. units are available. The local chapter of Phi Beta Kappa was founded in 1892. The well-equipped library features many special collections, including the Universalist Historical Society Library, the Theological Reference Library, the Library of Natural History and Biological Sciences, the Music Library, the Medical and Dental Library, and the Edwin Ginn Library of international law and diplomacy.

Scholarships and fellowships are available. There is also a loan fund. Many students earn part or all of their expenses. Students not living at home are required to live in college dormitories except with special permission. Additional housing for men is provided by the fraternities. *For statistics see* COLLEGES AND UNIVERSITIES.

J. R. To.

**TU FU** [du′ fu′] (712-770), also known as Tu Tzu-mei, one of the greatest Chinese poets, was born near Ch'angan, the Chinese capital during the T'ang Period. By the age of twenty-four he had made the Grand Tour of the Yangtze Valley; he then returned to the capital, but was rejected for the civil service at the Metropolitan Examination. From 735 to 746 he traveled in the north, making the acquaintance of Li Po and other men of letters. In 751 he enjoyed a brief moment of imperial patronage and was given a minor office in the Heir Apparent's entourage, not proportionate, however, to the ambition expressed in such poems as *Offered up to the Official Wei, My Senior.* On the eve of the rebellion of An Lu-shan (755-762) he left the capital and wrote *Chanting Thoughts as I Travel to Feng Hsien,* bemoaning his lack of recognition and lamenting the evil times. Here occurs his most famous couplet:

Within the red doors (of the rich) wine and meat spoil;
Out on the roads are the bones of frozen men.

In this poem he tells that his own little son had died of hun-

ger. In several poems he records the horrors of war (*The Tragedy of Ch'en T'ao*).

In 756 Tu Fu was captured by rebels, but escaped and was appointed censor by the Heir Apparent, now Emperor (757). He was, however, overconscientious in this post, and was cashiered. *Traveling to the North* tells of his return to his family and of their ragged and squalid condition.

In 758 Tu Fu held a post east of Ch'angan on the great military road, and here he recorded the sufferings of the people in wartime in six famous pieces, *The Conscript Officer at Hsin An* being the first.

In 759 he migrated with his family in search of a better life in Szechuan, and the next five years at his famous "Grass Hut" outside Ch'engtu were largely a period of peace and contentment. Here he wrote *River Village, Slowly Pacing, Reckless High Spirits,* and other poems. A quarrel with his patron in 765 caused him to flee down the Yangtze River, and in 770 he died at Leiyang, Hunan. His last poems included the autobiographical piece *Years of Strength Travel.*

Tu Fu's 1,400 surviving poems are a precise notation of everything he saw and felt, and they present a detailed history of his times. Less wild in fantasy than Li Po, his powerful imagination was focused by deep humanitarianism and by a fine sense of form. *See also* Li Po. H. Sh.

**TUGBOAT.** *See* Vessels, Inland Waterway.

**TUKUNA.** *See* Indian Tribes, South American (*Principal Linguistic Families*).

**TULA** [tu′lɑ], the name of both a governmental region and the city which is the administrative center of that region, in the west central Russian Soviet Federated Socialist Republic, in the Soviet Union.

**The City.** An industrial city, Tula is located 120 mi. south of Moscow, lying in a low valley on both sides of the Upa River, an Oka River tributary, where it is joined by the Tulitsa River. Discovery of iron and low-grade coal deposits in the area led to the establishment of its first gun factory in 1595, an iron factory in 1632, and the small arms factory fostered by Peter the Great in 1712, which continues in use. The city is an important communications center, and is the focus of five main rail lines. As the oldest Russian metallurgical center, Tula has factories producing arms, cutlery, and iron and copper goods, while the Tula wares, including the Tula samovars used all over the Soviet Union and the black enamel objects inlaid with silver, are famous. Other products are sewing machines, sugar, distilled spirits, leather goods, and foodstuffs. In addition to large production of apples and other fruits, there is considerable trade in apple nurslings. Pop. (est. 1950), 250,000. C. C. H.

**The Region.** Lying in the area known as the industrial center of European Russia, the region's 9,305 sq. mi. are bounded by the regions of Moscow on the north and east, Ryazan on the southeast, Orel on the south, and Kaluga on the west. It is situated on a plateau that is deeply incised by the Don River, and is in the transitional belt of forest and steppe, so that in the north it has poor podsolic soils, and fertile black earth in the south. Even though the climate is one of continental extremes, agriculture is well developed, with the largest acreages being devoted to rye, oats, buckwheat, sugar beets, and rubber-bearing plants (*Taraxacum*). Synthetic-rubber works and cement plants are operated. At Kosogorsk and Nova Tula foundries process the iron ore which comes from the southern part of the region. Coal from the near-by Moscow coal basin contributes to the industrialization. Pop. (est. 1954), 1,500,000. D. L.

**TULANE UNIVERSITY,** an accredited, coeducational, nonsectarian, privately controlled institution occupying approximately 100 acres in New Orleans, La. The colleges of liberal arts are co-ordinated, the women's division operating as the H. Sophie Newcomb Memorial College for Women. This institution started in 1834 as the Medical College of Louisiana. In 1845 the University of Louisiana was established by the state constitution and took over the medical college. The present name was adopted in 1884, when the state legislature transferred the university to the board of administrators of the Tulane Educational Fund. The various divisions of the university include the College of Arts and Sciences, the College of Engineering, the H. Sophie Newcomb College for Women, the Graduate School, the College of Law, the School of Medicine, the College of Commerce and Business Administration, University College (the evening division), the School of Social Work, the Middle American Research Institute, and the Summer School.

Degrees offered include the A.B., the B.S., the B.Ed., the B.Ed. in physical education, the B.Mus., the B.F.A., the B.B.A., the B. of Eng., the B.Arch., the LL.B., the M.C.L., the LL.M., the Master of Social Work, the M.D., the M.A., and the Ph.D. Tulane received a Carnegie Corporation grant for an experimental program aimed at developing a permanent university center for Latin American studies. The local chapter of Phi Beta Kappa was organized in 1909.

The well-equipped library features many special collections, among which are the Central American and West Indies collection on archaeology, linguistics, and exploration of the Middle American Research Institute; the William E. Gates collection of Mexican manuscripts, books, and pamphlets; the library of George H. Pepper on American Indians.

Scholarship offerings are generous and include awards to nominees of state senators and assemblymen, tuition grants to a limited number of citizens of Latin America, and tuition and maintenance awards to foreign students for graduate work in medicine. There is also a substantial loan fund. Opportunities for self-help enable nearly half of the students to earn part of their expenses. Some dormitory facilities are provided for female students and there is some housing in converted army barracks for male veterans. Additional living accommodations are provided by the campus sororities and fraternities. *For statistics see* Colleges and Universities. J. R. To.

**TULARE** [tulɛ′əri; tulɛ′r], a city in Tulare Co., in central California, located 45 mi. southeast of Fresno. The district was frequented as early as 1826, but the founding of the city did not occur until 1872, when the West Side Inn, which is an interesting historical landmark, was erected. In 1883 and 1886 two fires practically destroyed the community's business area. Incorporated as a city in 1888, Tulare has the council-manager form of government. Dairying is the most important activity of the vicinity, and Tulare is the shipping and processing center for the area's dairy products, cotton, fruit, grains, and livestock. Transportation facilities are provided by the Atchison, Topeka and Santa Fe and the Southern Pacific railroads. In Mooney Grove Park, 4 mi. east of Tulare, can be seen many of the large oak trees for which the territory is noted. Sequoia National Park is 35 mi. east. Pop. 1950, 12,445.

**TULAREMIA** [tulәri′mɪə], rabbit fever, or deer-fly fever, a highly fatal disease of wild rodents, especially rabbits, that can be transmitted to man by direct contact with infected animals or their carcasses; by the bites of infected animals;

by contact with water contaminated by bodies of infected water animals, such as water rats and beavers; by eating partially cooked meat of infected rabbits; or by blood-sucking insects. The antibiotics, aureomycin and chloromycetin, are effective in the treatment of tularemia. C. R. S.

**TULE** [tu'lɛ], the name given in the Pacific states to *Scirpus acutus,* a North American species of bulrush. A member of the sedge family, it is native to salt and fresh water marshes. From strong creeping rootstocks rise green, usually leafless stems, 3 to 9 ft. high, bearing at the tip many small flower spikes in crowded clusters. The stems furnish material for thatching and packing, and are a source of potash. Many thousands of acres of tule lands originally found in California have now been reclaimed for cultivation through drainage. J. C. Wis.

**TULE POTATO.** *See* ARROWHEAD.

**TULIP,** a large genus, *Tulipa,* of perhaps 100 species of bulbous herbs of the lily family, native to the Mediterranean region and Asia. They are erect plants with thick, crisp,

COURTESY OF ASSOCIATED BULB GROWERS OF HOLLAND

*COTTAGE TULIPS*

basal and stem leaves, and saucer or bell-shaped, usually erect and solitary flowers. Their easy culture, variety of color and form, long blooming period, and low cost have made them the most popular spring-flowering bulb for many centuries.

The garden tulip has been so extensively hybridized that its exact origin is unknown. There are now thousands of varieties, and their classification has become quite complicated. Among the types most commonly seen are: early flowering tulips, used mainly for winter forcing in greenhouses; cottage tulips, which bloom in May and have a wide range of solid colors; Darwin tulips, a later flowering group noted for their long stems and large flowers; breeder tulips, characterized by flowers in bronze and purplish tints; broken tulips, having vari-colored markings on the petals; parrot tulips, having twisted and slashed petals; lily-flowered tulips, bearing lily-like blooms; and double tulips, having many petals.

In recent years, there has been a growing interest in the wild species of tulip, many of which are adapted to the rock garden because of their small size.

Though tulips grow under very adverse conditions, they prefer a rich, sandy loam in full sun. They should be planted in late autumn, the bulbs being placed 6 to 8 in. or more below ground level, and mulched during the period when the ground is frozen. After blooming, the foliage must be allowed to wither and die back, even though it is unsightly, so that the bulb can store food for the following year. The bulbs can then be dug, dried, cleaned, and stored till fall, when they may be planted again, or they may be left untouched for several years.

Production of tulip bulbs has long been a major Dutch industry, and bulbs from Holland are exported in great quantities. In the first half of the 17th century, tulips became so popular, and speculation on the Dutch crop was so great, that fantastic sums were paid for single bulbs. During World War II, when no imports could be obtained from Holland, bulb growers began to raise tulips in the northwestern United States. J. C. Wis.

**TULIP POPPY,** a Mexican perennial herb, *Hunnemannia fumariaefolia,* similar to the California poppy but taller, growing as high as 2 ft. It is planted as an annual but requires a warm, sunny exposure. The flowers are yellow and measure 3 in. across. L. deF.

**TULIP TREE,** a tall, stately tree, *Liriodendron tulipifera,* of the magnolia family, common throughout the eastern United States from southern New England to southern Michigan, and south to central Louisiana and northern Florida. One of the largest trees of eastern North America, it attains its greatest size and abundance in the southern Appalachian Mountain region, where, in rich, moist, sheltered coves, it attains a height of 200 ft. and a diameter of 12 ft. The glossy leaves are truncated at the apex, ending abruptly as if cut off, but having a shallow notch. The large, greenish-yellow, tulip-like flowers develop into dry, cone-like fruits. It is planted for ornament in the eastern United States and in Europe.

The wood is known in the lumber trade as yellow poplar and poplar, and the sapwood is sometimes called whitewood. It is moderately light in weight, soft, weak, and low in stock resistance. Large quantities of the lumber are used for fur-

EWING GALLOWAY

*Tulip tree, with detail of twig, flower, leaf and fruit*

niture, boxes, and interior millwork. The large, round logs make high quality veneer, which is made into plywood for furniture.

The total stand of this wood in the United States has been estimated at 10,101,000,000 bd. ft., located mostly in Virginia, North Carolina, Georgia, and Alabama. W. D. B.

**TULLE.** *See* Textile Fabrics (*Silk and Rayon Fabrics*).

**TULLIVER** [tʌ′lɪvər], the middle-class English provincial family—father, mother, Tom, and Maggie—whose fortunes are the subject of George Eliot's *The Mill on the Floss* (1860). G. G. F.

**TULLUS AUFIDIUS** [tʌ′ləs ɔfɪ′diəs] (fifth century B.C.), Volscian general, according to Plutarch the opponent and rival of Caius Marcius Coriolanus in the Roman-Volscian wars of the early years of the Roman Republic. Upon Coriolanus' banishment from Rome, Aufidius welcomed him as an ally, and the two generals planned a joint campaign against the Romans. The bond between them was weakened, however, by Aufidius' jealousy, and when Coriolanus turned back from the walls of Rome instead of entering the city Aufidius took advantage of the clamor against him in the Volscian capital to have him murdered.

Shakespeare, following Plutarch's *Life of Coriolanus,* made Aufidius a principal character in his tragedy *Coriolanus.* The accuracy of either of these versions of early Roman history is highly questionable. R. V. L.

**TULSA** [tʌ′lsə], a city in northeastern Oklahoma, the county seat of Tulsa Co., situated on the Arkansas River, about 96 mi. northeast of Oklahoma City. The average mean temperature of the city is 62.6° F. It is located in one of the richest oil regions in the United States. In addition, there are natural resources of coal, natural gas, sand, and gravel. The Tulsa area has become known for its purebred herds of Hereford, Aberdeen Angus, and Shorthorn cattle. The principal products of the area are oats, corn, cotton, hay, peanuts, pecans, fruits, and vegetables.

Tulsey Town, as the community was first called, was founded about 1832 by a Creek Indian. The community occupied the site where the boundaries of the Cherokee, Creek, and Osage Indian nations met, and when it was incorporated in 1898 it was subject to the laws of these Indian tribes, for Oklahoma did not become a state until 1907. In 1900 the community had 1,390 residents, but by 1910 the population had risen to 18,182. This was caused by the important oil discoveries in 1904 and following years in the Tulsa district and the subsequent influx of oil prospectors and workers. Being in the heart of the oil fields, the city quickly became the center of oil activities, and it has become known as the Oil Capital of the World. Its real growth occurred between 1920 and 1930 when the population increased from 72,075 to 141,258. Tulsa has the commission form of government.

Tulsa serves as the transportation hub for the district. Daily flights are provided by the Braniff International, the Mid-Continent, the American, and the Continental air lines, and the Atchison, Topeka and Santa Fe, the Midland Valley, the Missouri-Kansas-Texas, and the St. Louis-San Francisco railroads furnish freight and passenger facilities. Not only is Tulsa the center of the vast oil operations, but it is also the financial, manufacturing, and commercial center of the region. The oil refineries are outside the city in West Tulsa and other points along the river. A large portion of the city's industry is allied with oil production and refining in the manufacture of oil-well equipment and petroleum products, in the publication of oil journals, and in oil technology. The factory output also includes scientific instruments, aircraft, castings, dairy products, packed meat, clothing and textiles, chemicals, glass, prefabricated houses, furniture, and clay products. Pop. 1950, 182,740. S. D. M.

**TULSA, UNIVERSITY OF,** an accredited, coeducational, privately controlled institution, affiliated with the Presbyterian Church. The main campus of approximately 40 acres is situated 3 mi. from the business center of Tulsa, Okla. Founded in 1894 as Henry Kendall College at Muskogee, Indian Territory, by the Presbyterian Church, instruction was begun that same year. The institution was moved to Tulsa in 1907. Reorganization took place in 1920, when the name was changed to the present form. The various divisions of the university were founded as follows: College of Arts and Sciences, 1894; College of Fine Arts, 1912; College of Petroleum Engineering, 1928; Downtown College, 1933; Graduate Division, 1934; College of Business Administration, 1935; and College of Law, 1943. The degrees offered include the A.B. and the B.S. in liberal arts; the B.S. in business administration, engineering, petroleum engineering, and chemical engineering; the M.S.; and the M.A. The Annual Accounting Conference, sponsored by the School of Business Administration, and conferences in marketing and management are held at the University each year. Special short courses in gas appliances are offered annually by the College of Petroleum Engineering.

The library features many special collections, among which are the Professor C. E. Kayser German Collection, the Alice Robertson Collection of Oklahoma documents and publications, the Professor Solon Shedd Geological Collection, the Harlin I. Smith Anthropology and Archaeology Collection, and the Haywood Collection of old manuscripts and original music for string ensemble.

Fellowships, scholarships, grants-in-aid, and student loans are available. Opportunities for self-help enable many students to earn part of their expenses. Dormitory facilities are available but limited in number. Additional living accommodations are provided for the members of some of the national fraternities on the campus. *For statistics see* Colleges and Universities. J. R. To.

**TUMBLEWEED,** a name applied to a number of North American prairie plants, the seeds of which are disseminated by the wind. In autumn, when the seeds are ripe and the leaves withered, the stems are broken off or uprooted by the wind and carried across open fields and along roadways, scattering seeds as they roll. The tumbleweeds are generally bushy weeds, growing to a height of 2 ft., or more, in the cultivated fields of central North America. Several of the most common species in this country have been introduced from Europe, including the tumbling mustard, *Sisymbrium altissimum.* Of the goosefoot family, the Russian thistle, or saltwort, *Salsola kali* var. *tenuifolia,* is found along the eastern shores of North America, and the bugseed, *Corispermum hyssopifolium,* in central and northern North America. The winged pigseed, *Cycloloma atriplicifolium,* another member of the goosefoot family, and the tumbleweed, *Amaranthus graecizans,* grow throughout the central United States. The name tumbleweed is also applied to the witch grass, *Panicum capillare,* and to the lance-leaved psoralea, *Psoralea lanceolata.* J. C. Wis.

**TUMION.** *See* Torreya.

**TUMORS,** literally "swellings," have been known to exist since ancient times. *Tumor* is one of the four primary signs of inflammation (*rubor, tumor, calor, et dolor:* redness, swelling, heat, and pain) listed by Celsus and Galen in Roman times, repeated during the Middle Ages, and even included in contemporary medical books. Today, however, the term is generally used to mean a neoplasm, that is, a noninflammatory growth of tissue which is not co-ordinated with normal body growth, serves no useful function, and often interferes with the normal body functions. Such a neoplasm, or tumor, may be either malignant or benign. Malignant neoplasms are commonly called "cancers." They grow more or less rapidly, infiltrate and destroy invaded tissues, and spread through the blood stream, lymphatic channels, and body cavities to distant sites of the body, setting up their destructive processes in these places also. This phenomenon of spread by the formation of new, separate centers of tumor tissue is known as "metastasis." Benign neoplasms more nearly resemble normal tissues, do not infiltrate or metastasize, and are frequently separated from the surrounding normal tissues by a fibrous capsule. Usually they grow slowly and do not harm the patient except by exerting pressure and damaging vital structures, such as the brain or lung, or by becoming ulcerated and infected.

Neoplasms, or tumors, occur in animals and plants as well as in human beings. Many different types have been found in all species of animals that have been sufficiently studied, and many plants develop analogous cellular reactions. Tumors have been recognized in fossils. A bony malformation which was probably a tumor was found in a dinosaur, and a mosasaur fossil of the Cretaceous period shows a tumor.

Tumors have been found in neolithic bones, in Egyptian mummies, and in the bones of pre-Columbian American Indians. Egyptian papyri, cuneiform tablets of Babylonia, and manuscripts of old India have descriptions relating to malignant tumors. Greek medical literature has many references to them, and Galen, writing in Rome in the second century of the Christian Era, has hundreds of passages on them. It is impossible to form any idea of the relative numbers and types of tumors in that day because of the lack of statistics and the fact that tumors often went unrecognized. While it is doubtful that the earlier civilizations had any clear understanding of their nature, Hippocrates distinguished between benign and malignant growths, and Galen was aware that malignant growths do not remain localized. Modern understanding of tumors has been made possible by the invention of suitable microscopes about 1820 and rests on the application of the cell theory to the study and classification of tumors by Muller, in 1838, and Virchow, in 1863.

Malignant tumors have shown a striking increase in incidence rate in the last fifty years. In the United States the cancer mortality rate doubled and by 1949 stood at approximately 139 deaths a year per 100,000 population (the mortality rate for benign tumors is in the neighborhood of four deaths per year per 100,000 population). This amounted to more than 200,000 deaths a year, about one seventh of the total from all causes. By 1949 cancer had risen from seventh to second place among the causes of death in the United States. It is estimated that about 300,000 new cases are diagnosed each year and that about 700,000 cases are under treatment. This involves an annual expense, for hospital costs alone, in excess of $100,000,000. About half of the rise in the incidence rate of cancer cases can be attributed to the increasing proportion of the population of older people, with their higher cancer rate. Part is also due to improved diagnosis, resulting in the recognition of many cases which might formerly have been missed. Constantly improving techniques of treatment, however, have resulted in a greater proportion of cases that can be cured.

Cancer of the lung has increased to the greatest extent (particularly in men), and cancer of the larynx, breast, prostate, esophagus, intestines, and pancreas have increased to a lesser degree. Cancers of the skin, stomach, liver, and uterus have decreased somewhat since 1940. The cancer mortality rate for women has been dropping since 1930, chiefly because of improved, earlier diagnosis and treatment. The greater increase of lung cancer in men has prevented a similar drop in the mortality rate for men.

Direct comparison with other countries is difficult and often impossible because of different methods of collecting statistics, incomplete diagnosis and reporting, and differing life spans. However, much higher rates than the United States' 139 per 100,000 are shown by the United Kingdom (193), France (172), and Germany (166). Holland shows a rate about the same as the United States; Chile's (87) and Japan's (77) are not much more than half that of the United States. Ceylon reports a rate of only 14, El Salvador, 21.4, and the Dominican Republic, 23.

## CLASSIFICATION

Tumors are divided into many types, which differ in growth characteristics, effect on the patient, and response to various types of therapy. The classification and naming of tumors is based primarily on cell type, malignancy, and organ of origin. Usually they depend on a microscopic examination of the tumor. Nearly every tumor studied can be recognized as being made up of cells resembling some normal tissue of the body, from which the tumor is presumed to be derived. As a group they are recognized microscopically by irregular and atypical cell type and cell arrangement. In general, the more malignant the tumor, the more pronounced are these two features. In some tumors, the atypicality is so great that recognition of the fundamental cell type is extremely difficult. The more malignant tumors frequently show invasion of the surrounding tissues and reversion of cell type to an undifferentiated, more embryonic appearance. Most tumors are made up of one type of neoplastic tissue plus nonneoplastic supportive connective tissue and blood vessels. The majority are named by a stem denoting the tissue type plus the suffix "-oma," which means "tumor."

Tumors within a single type do not necessarily have an identical appearance and do not follow identical clinical courses. All types, even of the most malignant tumors, show individual cases in which the patient remains free of tumor recurrence for many years. Some types, even of benign tumors, show a tendency to become more malignant as they grow older, especially if they are subjected to irritation. A number of attempts have been made to relate microscopic variation within a type to variation in clinical course. Of these, the most widely accepted has been the Broder classification, based primarily on the proportion of undifferentiated cells. Tumors occasionally show varying areas of different degrees of malignancy, from the histological standpoint. In these tumors it is usually the more malignant portions which are responsible for the formation of metastases, and it is thus against these more malignant areas that the treatment of the tumor is planned.

Classification is an exceedingly difficult and complex sub-

ject and despite the fact that it has been studied for approximately a century, there is still no agreement on a number of points. Some groups have still not been completely studied. Some types occur so rarely that only a few cases have been reported. Accumulation of knowledge on this topic requires the study, because of biological variation, of large numbers of patients with complete case follow-ups to the death of each patient, of whatever cause, and the performance of an autopsy to rule out unexpected features of the tumor growth. Such study has been hampered by the difficulty of keeping in touch with patients and, until recently, by the lack of autopsies on a large number of patients.

## CAUSE

No single cause of cancer has been found. Two general principles found are that most cancer-producing agents (carcinogens) are effective only if they are operative over a period of time and that tumors usually do not develop immediately, but only after the passage of some years (often 10 to 25), during the latter of which the tissues often show microscopic changes which may be called "precancerous."

**Chemical Causes.** The first elucidation of a cause of cancer was by Percival Pott, who in 1775 called attention to the scrotal cancer of chimney sweeps, caused by carcinogens in the soot. Nearly a century and a half later, in 1916, the first cancer to be produced experimentally was obtained by the application of coal tar to the skin of animals. Since then, a wide variety of chemical substances has been shown to be capable of producing tumors of many types. Cancer resulting from exposure to certain chemicals, such as crude paraffin oils, chromates, nickel, tars, and aromatic amines, has occupied the attention of industrial hygienists and necessitated control measures. Some cases of skin cancer developing in elderly persons are thought to be the result of tonics containing arsenic taken many years before. Several epidemiological and clinical studies have pointed to cigarette smoking as the cause of the increased incidence of cancer of the lung. Insecticides, food preservatives, and food-coloring agents are scrutinized for possible carcinogenic activity before approval by Federal agencies. The recognition and study of the action of chemical carcinogens in experimental animals is an active field of cancer research.

**Physical Causes.** Many cases of cancer have resulted from the action of physical agents such as sunlight, which can cause cancer in the exposed skin, particularly in individuals with fair or sandy complexions which sunburn easily. These tumors are common and occur most frequently in the hot, relatively cloudless areas of the South, where the sun's rays are more intense. Susceptible individuals who are much in the sun, such as carpenters, farmers, and sailors, may develop a succession of skin cancers over a period of years. In a rare hereditary disease, xeroderma pigmentosum, the skin is unusually susceptible to the carcinogenic action of the sun's rays. Most individuals with this disease develop many skin tumors early in life and finally succumb to them. X rays and radioactive substances are carcinogenic under certain conditions. They probably can cause most types of tumors, but cancer of the skin and leukemia are the most common. Many early radiologists developed these conditions before these hazards were understood. The development of osteogenic sarcomas in workers who painted watch dials with radioactive compounds attracted wide attention in the 1930's, and tumors have been produced experimentally by a wide variety of radioactive substances. Physical agents causing chronic irritation, such as snags of teeth, sometimes result in cancer. Instances of cancer after long exposure to heat are provided by cancer of the lip, formerly developing in those who smoked clay pipes, the stems of which became hot, and the Chutta cancer of India, developing in a group which smokes homemade cigars with the lighted end in the mouth.

**Hereditary Factors.** A number of types of tumor show some predisposition to run in families, but only a few human tumors have been definitely shown to be hereditary. All of these types also show sporadic nonfamilial cases. None is common, but the one that occurs most frequently is multiple polyposis of the large intestine. Polyps (small inpouchings of the intestinal wall) begin to appear when the individual is 15 to 25 years old. Hundreds to thousands develop in a single individual. A small proportion of the polyps gradually develop carcinomatous characters and the untreated patient usually dies at the age of 25 to 45 years. This condition is inherited as a Mendelian dominant trait. Polyps developing in other areas, such as the nose, are usually of an entirely different nature, usually are not true neoplasms, and only rarely become malignant. In multiple neurofibromatosis (von Recklinghausen's disease), many tumors, usually of nervous tissue origin, develop over the body. Retinoblastomas are rapidly growing malignant tumors developing in the eyeballs of infants and young children. They are thought to be due to a dominant factor which continally reappears as a result of repeated mutations. Xeroderma pigmentosum, mentioned above, is apparently due to an incompletely dominant gene and requires two factors, the inherited disposition and a physical factor, sunlight, for the formation of skin cancers. A number of animal tumors have been shown to be hereditary. A melanoma of fishes has been studied so carefully that the investigator can predict which cell will be the first to show neoplastic change. In other melanomas, several genetic factors are involved and the experimenter can juggle them so as to change the location and degree of pigmentation of the tumor.

**Viruses.** Viruses were early (1910) shown to be the cause of certain naturally occurring tumors in animals, but this has been demonstrated for only a few types. No human tumor, with the exception of the common juvenile wart, a quasi neoplasm, has been shown to be due to a virus, although recent studies with the electron microscope have shown virus-like particles in the blood serum of women with carcinoma of the breast.

**Parasites.** Certain parasitic diseases sometimes result in cancer, but through the medium of chronic irritation rather than as a direct carcinogenic effect. One of the early successful cancer experiments, in 1913, used parasites to produce stomach carcinoma in rats. Two oriental diseases of human beings probably belong in this category. Bilharziasis, a parasitic infestation of the bladder, sometimes results in cancer of that organ, and the group of parasites called liver flukes cause disease of that organ which sometimes eventuates in cancer.

**Hormones.** A number of animal experiments have shown that large doses of estrogen, a hormone produced by the ovary, can cause tumors, especially of the breast, ovaries, and uterus. In humans, functional tumors of the ovaries producing estrogens have been associated with, and presumably caused, cancer of the uterus in a number of cases. There is evidence that endocrine factors play a part in the development of human carcinoma of the breast and prostate.

**Miscellaneous Factors.** Obese individuals have a

slightly greater cancer mortality rate than normal persons, and underweight individuals have a lower rate. In animal experiments, underfed animals develop fewer tumors and develop them later than overfed animals. Some types of tumors show a poorly understood variation in incidence with differing social class and economic status. Breast cancer is more common in the higher economic groups. Statistical studies of women with breast cancer show that a higher proportion are unmarried than in the general population; those married have fewer children and their marriages take place at a later age. On the other hand, cancer of the cervix uteri is more common in women of lower economic groups and in women who have borne children. It is almost unheard of in celibate women and in Jewish women. Cancer of the pharynx, esophagus, and rectum is more common to brewers, tavern keepers, bartenders, and waiters. Cancer of the lung, lip, and mouth is more common on the lower economic levels. A number of pathological conditions, often minor in themselves, show some predisposition to develop into or cause cancer. Some of these are called "precancerous." Examples are keratoses of the skin, old scars (especially of burns including those from X rays), chronic inflammatory conditions such as varicose ulcers and draining sinuses, leukoplakia of mucous membranes, syphilitic plaques of the mouth, cirrhosis of the liver, gall stones, and (single) adenomas of the thyroid.

## CONTROL

**Public Health Measures.** Fifty years ago the subject of cancer was mentioned only as a depressing topic, for it was assumed that all persons with cancer died, despite every effort at treatment. This picture is not true at present because of early diagnosis on the part of both the patient and the doctor and because of improved methods of treatment. Some types of cancer show a high cure rate. The best results have been achieved in cancer of the skin. Even for this type, it is estimated that the cure rate could be increased from the present 85 per cent to about 98 per cent by the application of presently existing knowledge, mainly through education of the patient to seek earlier cure. Similarly, the cure rate of carcinomas of the uterus and breast could be increased to 60 or 70 per cent. Even when cure is impossible, great benefit has been achieved by the prolongation of a useful and comfortable life. The early suspicion of cancer by the patient and prompt treatment by the doctor are of the utmost importance. Symptoms which may indicate the presence of cancer are listed below. They are not always present when cancer occurs and some of them may be symptoms of other diseases or disorders.

Early Recognition of Cancer by the Patient

| *Site* | *Early Symptoms* |
|---|---|
| Breast | Lump. Irregularity in breast contour. |
| Larynx | Hoarseness. Pain and difficulty in swallowing. |
| Stomach | Vague and nonspecific decline in health. Discomfort in stomach region. Loss of appetite or distaste for food, especially meat. |
| Intestine | Change in bowel habits. Blood (often black and tarry) in stools. |
| Bladder, kidney, prostate | Blood in urine (often "smoky" urine). Frequent or painful urination. |
| Lung | Irritative cough. Mucoid, blood-tinged, or rusty-speckled sputum. |
| Uterus | Spotting of blood between menstrual periods, during menopause, or after menopause. |
| Skin | Appearance of a small lump or scaling area. Enlargement or change in appearance of a mole. |

In many cases cancers have developed beyond possibility of complete cure before they have produced symptoms recognizable by the patient. This is especially true of those located in internal organs such as the lungs, stomach, pancreas, and liver. They may have been entirely symptomless or may have been heralded only by a vague and nonspecific decline in health, a slowly developing weakness, a loss in weight, or an anemia. For that reason, routine physical examinations, as practiced at cancer-detection centers, may be one answer to the problem of cancer control. A microscopic examination of the various body secretions for desquamated tumor cells by the Papanicolau technique may enable a diagnosis to be made before a tumor can be seen on physical examination and several years before it has caused any symptoms. Recently, miniature X rays for screening tuberculosis have turned up a number of lung tumors, also long before they were large enough for the patient to be aware of anything wrong. Much research is being done to develop a simple, universally applicable test for cancer, similar to blood tests for syphillis and diabetes.

**Diagnosis.** Many tumors are diagnosed by the doctor and treatment planned on the basis of the patient's symptoms and his physical examination. In other cases, X-ray examinations, sometimes with the injection of opaque media, are necessary. Tumors in special sites may require various laboratory tests. Special instruments, such as the cystoscope, sigmoidoscope, and laryngoscope, permit direct visual examination of tumors in the bladder, lower colon, and other sites. Definite diagnosis usually depends on microscopic examination by biopsy before the operation, or frozen section during the operation, or complete examination of the tissue after the operation.

**Treatment.** Surgical treatment of tumors is constantly improving as study of cases discloses procedures which are most effective. In general, operations have become more extensive recently because of advances in our knowledge of the paths of spread of tumors and improvements in anesthesia, physiology, and pre- and post-operative care.

More powerful X-ray machines with greater penetrative ability are being used. The betatron, which produces streams of electrons which can be converted to very powerful X-ray beams, and the cyclotron, which produces streams of neutrons, are being studied to determine their value in tumor therapy. X rays are also used in treatment of a number of nonneoplastic diseases. The use of X rays depends on the fact that their lethal effect on tissues is more pronounced on tissues which grow rapidly (such as those in malignant tumors) and is stronger on some types of tissues than others. Various kinds of tumors differ greatly in their response, and most types which respond well at first do so to a lesser extent on repeated series of treatments. The problem is how to destroy or seriously damage the neoplastic cells without harming too greatly the neighboring normal tissues. This is more difficult in the case of internal tumors than for those located on or near the body surface. Radium, an element constantly giving off X rays (and other emanations), is of advantage in this regard because it can often be placed in the neoplastic tissue itself. The treatment of more widely diffused neoplasms, such as the leukemias, has been benefited by the large number of radioactive elements produced in the atomic energy centers. These elements can be incorporated into chemical compounds which are attracted selectively to the neoplastic tissue by its biochemical components or metabolic activity. The one most used has been radioactive phosphorus. Radioactive iodine has been effective in treatment of functional thyroid tumors.

Despite extensive studies, only a few chemical substances have proven of clinical value. Stilbamidine has been found to be attracted selectively to the neoplastic cells in multiple myeloma. A group of substances, the folic acid antagonists, are of benefit in many types of leukemia. Another group, the nitrogen mustards, has been shown to be of value, particularly in Hodgkin's disease and the leukemias. *See also* LEUKEMIA. D. J. S.

**TUNA** [tu′nə], large fishes of the family Thunnidae, found near the surface of warm and temperate seas. Related to the mackerels, tuna may be distinguished from them by a series of detached finlets on the caudal peduncle. They are wonderfully streamlined for maximum efficiency in speeding through the water and have grooves or depressions of the body into which the fins may fold. All are pelagic species which usually wander about the oceans in schools, feeding on other fishes. They attain a weight of over 1800 lb. and a length of more than 12 ft. There are four main genera of tuna listed in order of their commercial importance: yellow fin, *Neothunnus;* skipjack, *Katsuwonus;* albacore, *Germo;* and blue-fin, *Thunnus.* The blue-fin tuna, although widespread, is more northerly in distribution than other tuna and reaches a large size. One specimen which weighed over 900 pounds was caught off Massachusetts by rod and reel. These large blue-fin tuna are often called horse mackerel. All tuna are fine game fishes and of great importance commercially. About 150 million pounds were taken annually in recent years, practically all of which were canned. *See also* ALBACORE; YELLOW-FIN TUNA. E. C. R.

**TUNA CLIPPER.** *See* FISHING VESSELS.

**TUNBRIDGE WELLS,** a municipal borough and resort in Kent, England, about 29 mi. southeast of London, also known as Royal Tunbridge Wells. It owes its rise to the discovery of mineral springs in the vicinity by the third Baron North in 1606, and its popularity to the patronage of English royalty. Queen Anne, Beau Nash, Samuel Johnson, David Garrick, and Samuel Richardson were frequent visitors to the spa, making it one of the most popular resorts in England, particularly during the latter half of the eighteenth century. The springs are at one end of the Pantiles, or Parade, a covered walk lined with shops, bordering an avenue of lime trees. Pop. 1952, 38,750. A. W.

**TUNG** [tʌ′ŋ], a deciduous tree, *Aleurites fordii,* of the spurge family, native to eastern Asia and important commercially as a source of tung oil, which is obtained from the seeds. It is grown extensively in China and increasingly in Florida and other Gulf states. It reaches 25 to 40 ft. in height, bearing heart-shaped leaves and loose clusters of white, pink-centered flowers which appear before the foliage. The round fruit, about 3 in. in diameter, contains from 2 to 5 rough, thick-shelled, poisonous seeds. The tree begins to bear at 3 to 6 years, an average tree producing annually 20 to 50 lb. of nuts, which yield about 25 per cent of oil.

**Tung Oil.** Tung oil is produced from the seeds (nuts) of the fruit of the tung tree, *A. fordii,* and from the wood-oil tree, *A. montana,* both natives of China. For the 5-year period prior to 1938, China produced about 120,000 metric tons of tung oil annually, of which 88,000 tons were exported, 70 per cent going to the United States. This was China's most important export commodity. Exports from China were impossible during World War II, and this situation stimulated production in the United States, Brazil, Argentina, and elsewhere. In the United States, tung oil is now produced in Georgia, Florida, Alabama, Mississippi, Louisiana, and Texas; and production has amounted to from 8 to 15 million pounds annually.

Tung oil, as compared with most other drying oils, has a high specific gravity (0.940-0.943) and refractive index (1.5165-1.5200). Its analysis shows about 80 per cent eleostearic acid, 15 per cent oleic acid, and 5 per cent saturated acids. It turns to a solid gel on heating to 280°C. or above. The high content of eleostearic acid, which has three conjugated double bonds, accounts for the rapid drying by polymerization of the heat-treated oil to produce a hard, but elastic, waterproof film highly resistant to acids and alkalies.

Tung oil is used in the manufacture of protective coatings, such as paints and varnishes, in making insulating material for electric wires, printing inks, linoleum, oilcloth, brake lining, and also in the waterproofing of paper, textiles, and other materials. The leaves of the trees, the nuts, and the oil and press cake produced from the nuts all contain a poisonous principle which renders the oil inedible and the press cake totally unsuited for stock feed. The hulls of the fruit contain 2.0 per cent or more of potash. The ground press cake is a very satisfactory conditioner in mixed fertilizer. It is also used alone as a fertilizer and contains from 2.7 to 5.9 per cent of nitrogen, 1.0 to 1.8 per cent of phosphate ($P_2O_5$), and 0.9 to 1.9 per cent of potash ($K_2O$), depending on the conditions under which the fruit is grown and the amount of shell included in the cake. H. L. Cr.

**TUNGSHAN** or **SÜCHOW** [tʊ′ŋshɑ′n, su′jo′], a walled city in northern Kiangsu Province, eastern China, also known as Hsuchow. It is 160 mi. northwest of Nanking and is an important railroad junction. The city lies on the southern shore of Wei Shan Lake, and the old river bed of the Hwang Ho traverses it. The heavy silt of the low-lying area produces abundant crops, chiefly cotton, wheat, millet, and peanuts. Tungshan is also an important glass-making center, and has cotton and silk mills. The climate is temperate. Tungshan has long been a strategic point in China's military history. Toward the end of the Ch'in Dynasty (221-206 B.C.) the great military leader Hsiang Yu made it the capital of his kingdom. More recently it was the scene of two major battles. From Mar. 23 to May 19, 1938, Chinese defenders made a heroic stand against Japan's invaders; they scored the first great Chinese victory of the war, inflicting 30,000 casualties, before they were finally encircled and forced to withdraw. In the Chinese Civil War an engagement involving a million men was fought between Nov. 6, and Dec. 2, 1948, before Communists took the city. Pop. (est. 1947), 200,000. A. C. T.

**TUNGSTEN** [tʌ′ŋstən], symbol W (German *wolfram*), atomic number 74, at. wt. 183.92, density 19.3, m.p. 3,370° C., b.p. 5,900° C. Tungsten (Swedish *tung,* heavy, and *sten,* stone) was discovered by C. W. Scheele in 1781. It is the third member of Group VI-A of the periodic table, very closely related to molybdenum. It is a transition element, its atom having four completed shells of electrons (2, 8, 18, 32), a fifth incomplete shell of 12, and an outermost shell of 2. Tungsten forms unstable, bivalent compounds by giving up its two outermost electrons ($W^{++}$), but the most important compounds are derivatives of the trioxide, $WO_3$, especially those in which this oxide acts as the anhydride of an acid, such as $H_2WO_4$ or $xH_2O \cdot yWO_3$.

**Occurrence.** Tungsten is found in only a few materials in limited areas, usually associated with tin. The most impor-

tant ores are wolframite. (FeMn) $WO_4$, and scheelite, $CaWO_4$.

**Properties.** The properties of tungsten vary widely with its purity, method of production and treatment. It is usually gray to black in color, very heavy, very hard (4.5-8.0 on Mohs' scale), brittle, and nonmagnetic. It has a tensile strength about one-third that of iron, and has a low coefficient of expansion (about equal to that of Pyrex glass). Its melting point is the highest of any known element. When heated and worked, tungsten is extremely malleable and ductile. It oxidizes in air only at high temperature, and it is scarcely attacked by any single acid or alkaline solution; but a mixture of nitric and hydrofluoric acids, or fused hydroxides, is a fairly good solvent for the metal.

**Uses and Compounds.** The uses of tungsten metal are numerous and widely varied. In electrical equipment, it is used for the incandescent wire in light bulbs and electronic tubes, for tungsten arc lights, for contact points, for winding electric furnaces, for rectifier valves, for anticathodes in X-ray tubes, for electrodes in electrolysis equipment, and in the amplifiers for wireless communication. Other general uses include thermocouples, phonograph needles, gauze for filtering corrosive liquids, and for various applications in scientific instruments. Of the tungsten alloys, ferrotungsten is by far the most important. Both ferrotungsten and pure tungsten are added to steel to increase hardness, toughness, elasticity, and tensile strength. High-speed tool steel contains 18 per cent tungsten, 4 per cent chromium, and 1 per cent vanadium, or 6 per cent tungsten and 6 per cent molybdenum; these steels have vastly increased machine-shop output. Stellite is an extremely hard alloy of tungsten, chromium, and cobalt; it resists corrosion effectively and is used mainly for cutting tools. Only a few tungsten compounds are commercially important. Sodium tungstate, $Na_2WO_4 \cdot 2H_2O$, a white, crystalline powder soluble in water is used for water-proofing and fireretarding fabrics, for X-ray screens, and as a reagent for biological products and precipitant for alkaloids. From sodium tungstate are prepared the complex tungstates, such as the phosphotungstates and the silicotungstates. Tungstic oxide or tungsten trioxide, $WO_3$, tungstic acid, $H_2WO_4$, and ammonium paratungstate, $(NH_4)_{10}W_{12}O_{41} \cdot 5H_2O$, are produced in large quantity and used mainly for making tungsten powder. Tungsten carbide, WC, is extremely hard, and when properly cemented forms the valuable high-speed cutting steel known variously as Carboloy, Widia, or Carboram.

**TUNGUS.** *See* Asiatic Tribes (*Ural-Altaic*); Altaic Languages.

**TUNHUANG** [tʊ′nhwɑ′ŋ], an ancient oasis city of northwestern Kansu Province, north central China, near the Sinkiang border, southwest of Anhsi. It was a great center of Buddhist learning in the fourth century and contains a world-famous collection of Buddhist arts and classics. It was also an important point on the ancient caravan routes from China to Turkestan. Twelve miles southeast of Tunhuang are the renowned Chien Fo Tung (Thousand Buddha Caves), carved into precipitous cliffs by monks A.D. 366 at the height of Buddhist influence in China. These remarkable grottoes, of which about four hundred remain, have hundreds of colored murals depicting sutra stories, ancient traditions, Buddhas, lesser deities, princes, and commoners. The temple Rei Ying Sze at Tunhuang, in 868, began to produce Buddhist sutras which are said to be the first known examples of woodblock printing. In 1035 the city fell to the Tangut nomads of the Hsi Hsia kingdom, who devastated it. The valuable classics and paintings were saved, however, by monks who sealed them within the temple walls. The treasured collections were not discovered until 1899. They consist of thousands of fresco paintings, sculptures, and classical volumes, some of which were removed to the Fogg Museum of Art at Harvard University. Pop. 1946, 33,013.

A. C. T.

**TUNIC** or **TUNICLE** [tyu′nɪk, tyu′nɪkəl] (Lat. *tunica, tunicella*), in ecclesiastical usage, a sack-shaped garment, now usually with sleeves, worn as the outer liturgical vestment of the subdeacon in the Western Church, and by bishops under the dalmatic and chasuble in the pontifical celebration of Mass. Of ancient origin, it was used universally by subdeacons at the end of the tenth century, and in the late Middle Ages generally by acolytes. The development of its form, material, color and use has more or less followed that of the dalmatic.

N. J. T.

**TUNICA.** *See* Indian Tribes, North American (*Southeast*).

**TUNICATA** [tyu′nɪke′tə], a group of exclusively marine animals, first described by Aristotle, possessing an outer protective tunic of cellulose around the commonly barrel-shaped body. All tunicates feed by drawing in water, which contains microscopic food organisms, through a wide circular mouth, the inhalant siphon. The water passes into the sievelike pharynx through gill slits and finally leaves the body by way of the exhalant siphon. The food particles are trapped by a thin sheet of mucus produced in a ventral groove, called the endo-style. The food mass passes into the esophagus and out through the alimentary canal, where digestion and absorption occur. This peculiar feeding mechanism is also found outside the group in *Amphioxus* and in the ammocoete larva of the lamprey.

Tunicates are divided into three primary types: the Ascidiacea or sea squirts, all attached to the sea floor and existing both as solitary and as compound colonial forms; the Thaliacea, delicate oceanic forms rarely encountered close to coastlines, drifting or swimming often at considerable depths but never associated with the sea floor; and the Larvacea (alternatively called the Appendicularia or the Copelata), minute free-swimming tadpolelike tunicates equipped with a chordate tail. A similar tail, consisting of central supporting notochord, dorsal tubular nerve cord, and lateral muscle bands, is the outstanding but transient feature of the larval form of the ascidians and of at least one of the thaliaceans. The tail structure, taken together with the presence of true gill slits in all adults, definitely associates the tunicates with the vertebrates, although the two groups have undoubtedly gone their separate evolutionary ways since the immense antiquity of Pre-Cambrian time.

All tunicates are hermaphrodites. The majority of ascidians, all thaliaceans, though not the larvaceans, reproduce not only by egg and sperm production but also by budding. Among the thaliaceans, budding may result in a hollow dirigiblelike colony drifting through the water, as in the luminous *Pyrosoma* of tropical and semitropical seas, or may form a chain of developing and growing sexual individuals towed by the parental nurse form and breaking off progressively from the end of the chain to become free individuals, as in *Salpa*. The tadpolelike larvaceans use their tails for swimming only occasionally; generally they float in a complex cellulose house secreted by their skin and used as a food-capturing structure, the tail acting to draw in the water.

The ascidians live attached to the sea floor, mostly in shallow water. Some are solitary individuals that grow to relatively large size attached to the upper sides of rocks, or imbedded in sand or mud; others form flat colonies produced by budding, with many small individuals united in varying degree, attached to the more protected undersides of rocks, corals, seaweeds, and even other animals. N. J. B.

**TUNING,** in music, a term having two meanings. In its general sense, the word refers to that adjustment of instruments to a given standard of pitch which is necessary before they can be made to sound acceptable, either alone or together. The tuning of pianos, violins, and other string instruments is accomplished by tightening or loosening the strings slightly to raise or lower their pitch. Wind instruments are tuned by similarly lengthening or shortening their tubes and thus the enclosed columns of air. Tuning also refers to the basic system of scale intervals employed in a piano, organ. or in abstract theory, as "mean-tone tuning." *See also* TEMPERAMENT, MUSICAL. W. Li.

**TUNIS** [tyu′nɪs], the capital of Tunisia, situated in the northern part of the country at the head of the Gulf of Tunis. The city is built on a hilly isthmus between three lakes. To the south lies Salt Lake, to the north Lake Ariana, and to the east the Lake of Tunis, across which is La Goulette, the city's port. Tunis has two sections: the old native city and the modern European city, which the French began building in 1893. The native city includes the Medina, with its several gates, the Herat or Jewish quarter, the suburbs of Bardo and Marsa outside the city proper, the Kasbah, native markets, and many mosques. The Djamā el Zitouna (Mosque of the Olive Tree) was founded in 732 by the Ommayads and serves as a Moslem university. The remains of many Roman and pre-Roman towns in the hinterland attract tourists. Especially interesting is the Roman aqueduct from Zaghouan to the site of ancient Carthage, which lies 12 mi. northeast of Tunis. Railroads connect the city with Algiers and Casablanca to the west and Gabès to the south. Chief exports are wheat, olive oil, phosphates, alfa grass, and iron ore. In World War II the city was repeatedly bombed by Allied forces before they captured it on May 17, 1943. Pop. 1946, 364,593, of whom 175,200 were Europeans. W. S. V.

**TUNIS, UNIVERSITY OF,** a Mohammedan institution of higher learning in Tunisia, which for thirteen centuries has been an educational center. In 1842 the school as it is now known was established with a faculty of 100 professors and assistants. Enrollment of 1,000 students was attained, 500 of whom received free maintenance. In 1870 the government reorganized the university along modern lines, and in 1875 a decree admitted courses in history, geography, geometry, and astronomy, which enlarged the basic program of theology, Moslem law, and Arabic literature. Demands for further modernization led in 1909 to student strikes and riots, supported by the Arab press in a vigorous campaign on behalf of a modernization program. As a result of this support, publication was suspended by the authorities in 1911. Between 1919 and 1926 the campaign was renewed and intensified, and in 1928 the commission of education introduced new courses for notaries. Student strikes have been frequent in intervening years. In 1954 the faculty numbered 950 and student enrollment was about 11,362. A. L. H-Q.

**TUNISIA** [tyunɪ′zhiə], a French protectorate in North Africa, bounded on the north and east by the Mediterranean Sea, on the southeast by Libya, on the southwest by the Sahara Desert, and on the west by the province of Constantine in Algeria. Including a part of the Grand Erg Oriental, the area of Tunisia is 63,616 sq. mi.

THREE LIONS

*Adobe housing of the honeycomb type, which once served as fortifications, is common in Médenine, southeastern Tunisia.*

**Physical Features.** Physically, the tertiary highlands of northern Tunisia are of complicated relief. They form short ranges and massifs which are at the eastern end of the Atlas system, about 4,000 ft. high, and show in their general trend the southwest-northeast alignment. These chains separate many fertile valleys, the most important of which is the Medjerda, between the Kroumirie and Mogod mountains. Where the highlands reach the sea they form bold promontories. North of the mountains is a narrow strip of lowland, and to the south is an upland region decreasing in elevation, gradually southward, to the Chott depression which is about 49 ft. below sea level. Near the Libyan borders the land rises again to 2,500 ft. The eastern shores south of Cape Bon are flat and sandy with shallow gulfs, such as the gulfs of Hammamet and Gabès, in front of which are the islands of Djerba, Chergui, and Kerkennah.

The climate of Tunisia is generally Mediterranean with mild, rainy winters and hot, dry summers. Precipitation decreases southward to the plateau region and the Sahara. In the north there are permanent streams, the Medjerda and Miliane; in the south the wadis do not reach the Mediterranean, but lose their water in the sebkhas, or shallow salt depressions, while the southern wadis in the Sahara generally are dry.

The most important river is the Medjerda, which is 228 mi. long. The temperatures in Tunisia vary from 52° F. to 79° F. The rainfall varies from 28 in. in the north to about 8 in. in the south.

**Flora.** As a result of heavy rainfall, the northern mountains are clothed in rich evergreen forest abounding in cork oaks. Toward the south, the olive tree becomes increasingly prominent, and on the plateau, due to insufficient rainfall (about 10 in.), grasses prevail, mainly alfa grass. To the extreme south there are oases and irrigated gardens where dates grow in profusion. In the northeast, including the

peninsula of Cape Bon, the soil is suitable for the cultivation of oranges and other citrus fruits. South of this the Sahel area abounds in olive trees, which are drought-resistant. In general, from north to south, there is a succession of vines, olives, and date palms, following the decrease in precipitation.

**Fauna.** Among the domesticated animals of Tunisia are horses, asses, mules, cattle, sheep, pigs, goats, and camels, the latter still being in general use among the merchants and tribesmen who traverse the Sahara. S. Van V.

**Economy.** The chief agricultural products of Tunisia are wheat (average yearly production: 650,000 tons), barley (350,000 tons), olive oil (70,000 tons), dates (43,000 tons), and fruits, including oranges, lemons, and apricots. Livestock includes sheep (3,500,000), goats (2,300,000), cattle (500,000), and camels (240,000). The cultivated area extends over some 12,000,000 acres, of which 1,700,000 acres are *habu* lands, or intransferable religious holdings, and 6,500,000 acres collectively owned tribal lands. Tunisians own 80 per cent of the total acreage in white and barley, 86 per cent of the 25,000,000 olive trees, 94 per cent of the sheep and cattle, and practically all the goats and camels. French interests are represented mainly by corporations occupying about 12 per cent of the productive land. The most important industry is mining. There are virtually inexhaustible deposits of phosphates in the south, particularly around El Kef and Gafsa. The yearly production of phosphates is about 2,000,000 tons. Iron ore (1,000,000 tons) and lead (38,000 tons) are extracted in the north. Other industries includes about 2,000 olive-oil mills, 120 food-paste factories, and 40 canneries for vegetables and fruits. Native handicrafts flourish, particularly those specializing in rugs, leather goods, and pottery. In 1953 foreign trade amounted to 100,000 million francs; imports (60,000 million francs) included machines, petroleum products, sugar, and textiles (75 per cent from France). Exports (40,000 million francs) were mainly wheat, phosphates, iron ore, and lead (60 per cent shipped to France).

Tunisia has 4,800 mi. of roads and 1,310 mi. of railway, one line linking the capital city of Tunis with Algerian centers to the west and with Gabès to the south. Tunis, Bizerte, Sousse, and Sfax are the most important ports.

*Sailboats tied up along the palm-lined waterfront at Gabès, on the Golfe de Gabès, an arm of the Mediterranean in eastern Tunisia*

FPG

**Population.** The native population consists of Arabs and Berbers, all of whom are Mohammedan and constitute the bulk of the population. The Arabic language is spoken primarily, but there are some places, particularly in the Kroumirie Hills, where the Berber dialects predominate. The population, which in 1946 was 3,230,952, was estimated in 1953 at 3,500,000, including a small group of 250,000 persons having generally French nationality but of either French or Italian origin.

**Government.** Tunisia is under the nominal rule of a bey, whose position dates from the period of Turkish control. The founder of the present dynasty was Husein ben Ali, elected in 1705. Since Tunisia came under the French protectorate in 1881 a resident general of France has supervised the administration of the native bey under the arrangements between France and Tunisia signed at the convention of June 8, 1883. But according to an agreement ratified by the French Assembly on July 9, 1955, and signed by the Bey on Aug. 27, 1955, Tunisia was granted internal autonomy, and on Sept. 29, 1955, the first all-Tunisian government was approved by Sidi Lamine, Bey of Tunis. For administrative purposes, the whole country is divided into 37 caidats, each headed by a Tunisian caid whose actions are to be supervised by a national assembly.

**History.** Tunisia was first settled by the Phoenicians, who established themselves along the coast and founded Carthage. After the Romans captured Carthage at the end of the Third Punic War in 146 B.C., North Africa was settled by the victors and became a province of Rome. In A.D. 439 the Vandals invaded and captured Carthage, but it was returned to Rome by Belisarius in 533-534, and was under Roman rule until the Arab conquest in the seventh century. The region passed into Norman control under Roger I of Sicily in 1158, but his rule ended in 1160, and the region was held by Arabs until the Turks drove the Spaniards, their chief rivals, out of Tunisia in 1574 and made it a Turkish province until 1705. In that year Husein ben Ali was proclaimed ruler of the province under the title of bey and founded a hereditary dynasty which still rules Tunisia.

In the nineteenth century British, French, and Italian imperialists viewed Tunisia with covetous eyes, and after the conquest of Algeria the French pressure on Tunisia was increased. At the Congress of Berlin in 1878, the British allowed the French a free hand in Tunisia in exchange for recognition of their position in Cyprus, and in 1896 Italy recognized the French protectorate over Tunisia.

At the outbreak of World War II, after declaring war on France, Mussolini hoped to acquire Tunisia. In the autumn of 1942 after the Allied landing in North Africa, Tunisia became a battlefield and was a theatre of operations for several campaigns between the Allies and the German Afrika Korps. In March 1943, the British succeeded in piercing the Mareth Line on the eastern borders. The Germans were driven back to the sea, and on May 7, 1943, the Allied forces captured Tunis and Bizerte. One week later Tunisia was restored to the French. After the war the Tunisians demanded thoroughgoing political reforms. For several years, however, the French refrained from taking any decisive step, until, in 1952, grave and widespread unrest broke out in the country. By the beginning of 1954, the situation had become critical and terrorism in the cities and armed attacks upon outlying settlements were rampant. On July 31, 1954, French Premier Mendès-France flew from Paris to Tunis and made a solemn promise that France would grant Tunisia full internal au-

BLACK STAR

*Natives of Djerba, an island in the Golfe de Gabès, taking water from a cistern in the courtyard of the Mosque of Houmt Souk*

tonomy. Almost at once terrorism ceased, and negotiations were started in Paris during the second part of 1954. By Sept. 29, 1955 the first all-Tunisian government had been approved by the French Assembly and the Bey of Tunis.

W. S. V. and G. E. L.

**TUNNELS AND TUNNELING.** A tunnel is an elongated underground excavation, chamber, or passageway. True tunnels are excavated, or driven (the general term for the process of tunnel construction), from one or more access points without disturbing the ground surface. Many underground structures, built in an open trench and then covered over, such as part of New York's subways, are also called tunnels, though they are not actually constructed by tunneling methods.

**History.** The history of tunnels goes back to the end of the Stone Age, when man first discovered how to use metals and began to tunnel into the earth for ore. Water tunnels or underground aqueducts date from pre-Christian times. Tunnels were usually wholly associated with mining until fairly recent times. Modern tunneling began when many early canals were connected by tunnels through intervening hills. The first on record is the 515-ft. Malpos Tunnel in France, completed in 1681. The first American tunnel was on the Schuylkill Canal in Pennsylvania, 18 by 20 ft. in section and 820 ft. long, driven in 1820. In 1831 the first railroad tunnel, built to portage canal boats over a mountain on railroad cars, was completed near Johnstown, Pa.

**Classifications.** Tunnels are classified according to use; railroad, subway, vehicle, water, sewer, pedestrian, drainage, river diversion, and power (hydroelectric) are the more common self-evident classifications. For construction purposes they are roughly designated by hard rock or soft ground, depending upon the kind of material encountered in driving. Except for refinements of interior finish, the classification or use to which the tunnel is to be put does not affect the driving procedure, since the construction operations are dictated by the type of ground in which the tunnel lies.

**Dimensions.** Tunnels may be circular, oval, or horseshoe in shape. Driven tunnels are seldom square or rectangular because structures of these shapes do not resist external pressures well. Although tunnels have been driven as small as 3½ or 4 ft. in diameter, such sizes are not economical because of cramped working conditions. It is cheaper to drive a 6-ft. tunnel, in which men can work freely, even though that size is larger than necessary for the purpose—to carry a certain amount of water, for example.

Tunnels of largest diameter in the United States are the 85-ft. double-deck vehicle bore under Yerba Buena Island, connecting the two sections of the San Francisco Bay Bridge, and the four 56-ft. tunnels driven for diverting the Colorado River around Hoover Dam during its construction, later converted to power tunnels and floodways. The longest tunnel in the world is New York City's Delaware Aqueduct, extending for 85 mi. from the Catskill Mountains to Hill View Reservoir in Yonkers. The longest tunnel driven solely from the two ends (known as portals) without intervening shafts, adits (horizontal or sloping shafts), or other points of access is the 13.1-mi. Alva B. Adams tunnel in Colorado, completed in 1946 to divert irrigation water from the west slope to the east slope under the Continental Divide. The longest railroad tunnel in the United States is the New Cascade, 7.8 mi., on the Great Northern Railway in Washington, followed by the 6.1-mi. Moffat Tunnel in Colorado.

COURTESY OF CONSTRUCTION METHODS

## GENERAL TUNNELING PROCEDURE

Certain fundamental construction procedures apply to all tunnels. Where possible, the site is probed in advance by borings to reveal the nature of the ground to be encountered. These advance explorations, coupled with a study of the geology of the region, usually give a fairly accurate picture of underground conditions, though sometimes they prove to be inaccurate. The earth's surface is a complex mixture of many kinds of soil, and often the best of advance explorations will fail to reveal soft spots, faults (crushed internal slide zones), and underground watercourses. Every bit of material lying within the tunnel limits must, of course, be excavated and the spoil removed entirely from the bore. This spoil, whether it be hard rock or soft silt, is always known as muck. The walls and roof, except in very solid formations, must be shored or lined with protective steel or wood supports as the tunnel is advanced in order to prevent cave-ins. Sometimes in soft ground even the floor must be braced. The workings also must be ventilated and drained.

Except in rare cases where the tunnel will stand without support or lining, or where its use does not require lining (as in drainage tunnels), the excavated area is given a permanent lining. This is usually a concrete shell, sometimes heavily reinforced with steel rods. Final tunneling operations adapt the bore to its intended use. In vehicle tunnels the roadway must be installed, along with ventilation ducts and light and power lines. Railroad and subway tunnels must be equipped with track and signals. High-pressure water and power tunnels often receive an inner lining of steel pipe.

## HARD-ROCK TUNNELING

Driving tunnels through hard rock follows a general pattern of procedure. The rock is drilled and blasted, the muck is loaded and removed, the necessary temporary lining or supports are placed, and, usually, after all excavation is complete and the bore is holed through, the final lining is placed.

**Method of Attack.** Excavated parts of tunnels under construction are called headings. The end of the heading

where the advance is being made is the face. Tunnels are driven from one or both portals, from shafts sunk to the tunnel line, or from adits. Length of tunnel, topography, and speed requirements dictate the number of access points. Intermediate shafts or adits, spaced between the portals, provide points of attack for opening up additional headings, thus speeding up the work. Sometimes, for large and long tunnels where progress might otherwise be slow, a smaller tunnel, known as a pioneer bore, is driven alongside the proposed tunnel. Crosscuts connecting the pioneer and main bores offer many additional points of attack. The muck is removed through the crosscuts and the pioneer bore.

Many methods were formerly used in advancing the face. A popular method, known as "heading and bench," was to drive the top section somewhat ahead of the lower or bench section. Variations of this attack included driving the bottom part first, or carrying side and top drifts (small tunnel sections) ahead of the main face, then connecting these drifts across the face by enlarging operations that eventually removed the entire face. Today, however, owing to development of better equipment and temporary supports, most rock tunnels are driven by the full-face method, in which the entire tunnel area is advanced simultaneously.

**Drilling.** Blastholes, ranging from 1¼ in. to 2¾ in. in diameter, are drilled into the rock face with pneumatic drills, which have long since replaced the old hand drills and earlier power drills operated by steam. Compressed air for the drills is supplied through pipes and hose at pressures from 75 to 90 lb. per square inch, from compressor plants outside the tunnel. Modern drills, known as drifters, have automatic feed; that is, they force the bit into the rock automatically as the hole is chipped out. A mixture of air and water, also piped to the drill, is forced under pressure through the hollow center of the drill steel and bit into the bottom of the hole, to keep down the dust and to flush out the cuttings.

Drill bits are either forged to the drill-steel shank or rod or threaded to the ends of the rod. Drifters have a feed of as great as 48 in., that is, they can drill as much as 48 in. of depth in each run. As blast holes usually run from 4 to 16 ft. deep, drill steels must be changed to longer lengths for each feed of the drifter. In the past, bits, both forged and threaded, have been made of hardened steel, but since 1948 inserts of tungsten carbide, cemented into slots at the bit end, have changed drilling economics. Where steel bits stayed sharp only a few inches to a few feet of hole drilling, depending on rock characteristics, carbide bits drill 20 to more than 100 times as much hole. Like most steel bits, they may be resharpened.

The drifters, which weigh up to 250 lb. each, formerly were mounted close to the face on steel columns or bars wedged across the tunnel and were clamped to the bars for easy shifting to new drill-hole locations. In recent years the drill carriage, or jumbo, has replaced the slow, cumbersome column-and-bar mounting, even in small tunnels. The jumbo is a car riding on rails and carrying a frame at the back or tunnel-face end, upon which several drills are mounted. Until recently, drifter support has been provided by several short clamp-held bars. Now, booms with powered elevation and swing devices position drifters correctly for each hole. The jumbo also provides convenient platforms from which the holes can be loaded with dynamite for blasting. When a round of holes has been drilled and loaded, the drifters are folded back out of the way and the jumbo is pulled to a side track clear of blasting.

**Blasting.** Dynamite comes in various strengths and types, each suited to a particular hardness of rock. Types used for wet holes are waterproof. Paper-wrapped cartridges of dynamite, about 1¼ in. in diameter and 9 in. long, are tamped into the drill holes with wooden rods. The amount of dynamite placed in each hole varies widely with type of rock and the drill pattern. Some rocks can be blasted more economically with few drill holes and correspondingly heavy charges in each hole; other rocks are best suited to more holes and lighter charges.

COURTESY OF "CONSTRUCTION METHODS"

*Drilling equipment for driving rock tunnels is mounted on front end of carriage (jumbo) which is shoved against tunnel-heading face.*

Electric blasting has entirely replaced the old-time burning fuse in tunneling. An electric detonator or cap, about the size of a short lead pencil, is inserted in one cartridge in each hole, usually the second from the bottom. Wires from the cap lead out of the hole and are connected to a firing circuit. The remaining cartridges are fired by concussion from the primed cartridge, the one carrying the cap.

If all the holes were fired simultaneously, much of the blasting force would be wasted in counteracting the thrust between holes. Therefore the round is fired in short sequences, only a fraction of a second apart, known as delays. Usually the center of the face is drilled with sloping holes that meet inside the rock at the apex of a pyramid or cone. This forms the cut, or the center blast area. The cut, being wedge-shaped, is forced out of the face by the first blast, known as simultaneous or zero delay. Then the round of holes surrounding the cut goes off on the first delay, throwing the rock into the now open cut space. In turn, the surrounding holes go off in succession from the center outward in subsequent delays, which run as high as nine or ten in number. Delay shooting, by throwing the rock inward into already loosened areas, utilizes the full strength of the dynamite for pulling and breaking the rock and also reduces the distance it flies from the face. Since all the broken rock or muck must be picked up and loaded, reducing the amount of fly rock saves time and money.

**Mucking Out.** The process of loading and removing the muck is known as mucking out. Hand loading has been entirely replaced by power-shovel loading. In large tunnels the shovels are short-boom variations of standard crawler-mounted shovels, but a special type of shovel, popularly known as the mucking machine, has been developed for medium and small tunnels. It operates on a track and is powered either by compressed-air engines or electric motors. One type plows into the muck pile, scoops up a load, and tosses it overhead onto a belt conveyor discharging into a

car attached to the mucker. Another type scoops up a load, swings around, and dumps into a car.

Cars are side-dump type for easy unloading. A locomotive brings a string of empties, capable of holding an entire round of muck, to the face. In most tunnels there is room for only one operating track except at points temporarily widened for sidings, so that as the forward car is loaded it must be switched back into the train and an empty car placed at the head end. Switching is often done with a "cherry picker," a small hoist or crane that lifts an empty car clear of the train while the rest of the cars are pulled back out of the way. Then the "empty" is dropped at the head end and the newly arranged train is shoved up against the mucker. The locomotive, called the dinkey, is always at the rear end, toward the portal. Sometimes, temporary sidetracks or a system of portable passing tracks is used instead of the cherry picker.

Storage-battery electric locomotives are the most popular type. In long headings, small diesel engines are sometimes used, a procedure made possible by modern ventilating methods. The trolley-type electric locomotive, common in mines, is seldom used in tunneling because of the danger and bother in constantly extending the trolley wire. Diesel trucks recently have been used to haul muck in large tunnels. Scrubbers—water tanks through which engine exhausts bubble—reduce noxious gases.

**Timbering.** All bracing and temporary lining is known as timbering, because formerly all supports were timbers; now they are usually steel beams and posts. The timbering system varies, of course, with the condition of the ground. Sometimes only a few steel ribs set circumferentially against the roof and carried on steel posts will be sufficient to hold the ground. Recently, an inexpensive technique, roof bolting, has been developed to replace timbering, where rock is fairly stable. Long bolts are anchored in holes drilled radially into the roof. Holding large washers or plates snug against the roof, the bolts have the effect of pinning roof-rock in place. Elsewhere, in rock that is stable, but tends to slake off when exposed to air, a thin layer of sprayed-on cement mortar affords sufficient protection. For other projects, far more elaborate protection is necessary. This may consist of closely spaced ribs connected by steel plates to form a tight sheathing, or by cross beams for supporting heavy ground. In ground that may cave in, it is essential to back-pack the space between the timbering system and the ragged contour of the tunnel (rock never breaks smoothly) to provide a constant full-bearing on the timbering system. Wood blocks or pieces of rock are used for packing.

**Ventilation.** Dynamite explosions release clouds of noxious smoke and fumes and create much dust. The smoke and dust must be removed from the heading to afford safe working conditions, and fresh air must be supplied to the workmen. Modern ventilating methods have made tunnels as safe, so far as air is concerned, as air-conditioned offices. Large-capacity fans, located in the open air at portals or at tops of shafts, blow fresh air into the headings or draw foul air out through large metal or reinforced-canvas pipes installed for this purpose.

**Drainage.** Tunnels are usually wet, for they cut through underground watercourses and wet seams. All excess water flowing into the headings must necessarily be removed. A common practice is to install a series of electric or air-driven pumps at sump holes into which the water flows. The pumps are connected through check valves into a discharge pipe line leading to the portal or up the shaft to the surface. Many tunnel projects have been complicated by extremely wet conditions which call for special handling. At San Jacinto, on the Colorado River Aqueduct, a special pump room, complete with remote-control pumps and motors installed in a watertight chamber, was necessary to take care of deluges of water released from underground lakes. The workmen had to evacuate this tunnel when heavy flows were encountered; and the heading quickly filled up, with the water rising high in the shaft. At the Leadville Drainage Tunnel in Colorado an attempt was made to seal off a heavy flow of water by the usual method of drilling into the wet zone and forcing grout, a mixture of cement and water, into the wet seams. However, the water encountered was so cold that the cement would not set fast enough to block the flow. The contractor overcame this difficulty by including oats in the grout mix, which, upon becoming wet, swelled sufficiently to block the flow until the cement could slowly set in the cold water.

## SOFT-GROUND TUNNELING

Tunneling in soft ground follows the same general procedure as that for rock, except that drilling and blasting are eliminated. Usually, much more attention has to be paid to timbering and temporary lining, since soft ground is difficult to hold in place.

Excavation is by pneumatic spades or by power-pulled knives that slice the ground away. Loading of muck into the cars is frequently done by hand, for soft ground is usually too sticky to handle with power shovels. Sometimes the muck is thrown by hand onto a conveyor which loads the cars.

**Compressed-Air Tunneling.** Where a soft-ground heading requires continuous support of the walls, roof, and face, the compressed-air method is often used. A tight bulkhead of concrete or steel is built across the tunnel at portal or shaft to seal off the heading. Then, compressed air is pumped into the heading at pressures varying with conditions. Sometimes the pressure is as high as 48 lb. per square inch.

Workmen, materials, and cars enter and leave the compressed-air heading through locks in the bulkhead. These are simply long, cylindrical steel chambers, with one door opening into the pressurized heading, the other into the free air. The locks operate as follows: the door on the high-pressure side is closed, and the other door is opened to admit men or materials entering the tunnel. Then this door is closed, and air from the high-pressure heading is admitted

EWING GALLOWAY

*Sand hogs at work behind tunnel-heading face, removing muck*

to the lock through a valve-controlled pipe. When the pressure within the lock equals that in the heading, the door into the heading is opened. Access from high-pressure to normal air is just the reverse, though when men are "locking out" of the tunnel, the pressure must be reduced very slowly to permit excess nitrogen absorbed by the blood under high pressure to be released through the lungs. If decompression is too fast, the nitrogen bubbles may collect in restricted blood channels, such as leg and arm joints, resulting in a painful affliction known as the "bends." Recompression followed by very slow decompression is the only relief for bends. Air in the pressure heading is pumped in at a rate to maintain constant pressure, that is, at a rate to compensate for all leakage through the ground, which is considerable in some cases.

**Shields.** For very soft and wet ground, tunnel builders resort to the use of a shield. This device, first used by Sir Marc Brunel in 1818 in a tunnel under the Thames in London, has made many tunnel projects possible. All the railroad, subway, and vehicle tunnels under the Hudson and East rivers at New York City have been driven by the shield method.

The shield is essentially a huge steel cylinder, slightly larger than the outside diameter of the tunnel to be driven. The front half is divided into compartments, usually sealed off by hydraulic gates that can be opened to admit muck from the face. The front or cutting edge carries an overhanging hood; the rear or tail end is open. Within the tail is a series of hydraulic jacks which propel the shield, shoving it ahead into the face.

Continuous primary lining, consisting of curved cast-iron or fabricated-steel segments, must be used in shield operation. These segments, which build up into a complete, tight ring of lining, are flanged at the sides and ends so that they can be bolted together. Lining segments are usually 30 in. wide, so that the completed ring of lining makes up 30 in. of the tunnel. The new ring of lining is always erected within the protecting tail of the shield.

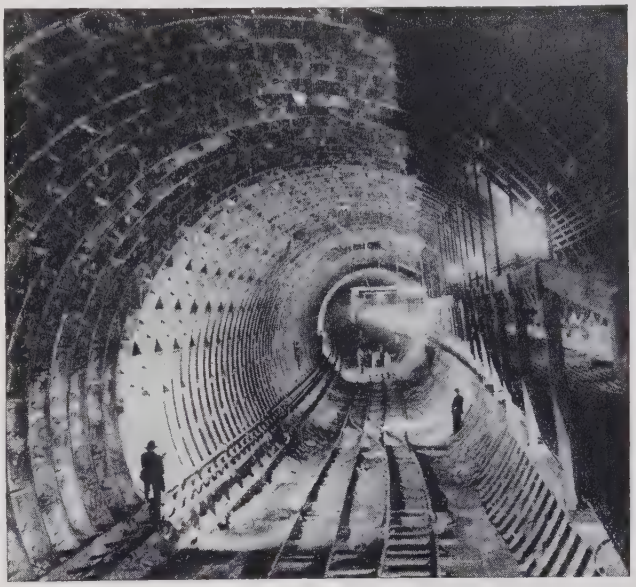
**Cycle of Operation.** The cycle starts after a new lining ring has been erected. The jacks are extended, pushing against the front-end face of the lining. Since hydraulic pressure operating the jacks is as high as 6,000 lb. per sq. in., the series of jacks can exert a powerful shoving force, which slowly pushes the shield ahead. During the shove the gates are opened and the displaced muck oozes into the working chambers much as tooth paste is squeezed from its tube. The ribbons of muck are cut into chunks with wire loops, dumped onto belt conveyors, and loaded into cars. Each forward advance is 30 in., the width of one ring of lining.

After the shove is completed, the jack pressure is reduced so that it is just sufficient to hold the shield in place. Then segments for a new ring are brought into the shield and are hoisted in place one at a time by an ingenious hydraulic-operated erector arm. As each segment is placed, the shoving jacks in that area are retracted, leaving a clear opening for the new segment. When the segment is placed and bolted to its neighbors, the corresponding jacks are again extended under low pressure to hold the shield steady. Because end joints of the segments are radial, special key sections with parallel ends are required to close each ring.

After the ring is complete, the shoving cycle is repeated. The tail of the shield always extends back beyond one ring, so that the workmen are protected by the shield or the completed primary lining. The shield is guided during the shove by varying the pressure on individual jacks. Hydraulic pressure for the jacks comes from a special pump, known as an accumulator, located outside the tunnel; and the hydraulic fluid under high pressure is carried to the shield through thick-walled piping.

### CONCRETE LINING

Most tunnels receive a permanent concrete lining, from 6 to 15 in. thick, which is placed after excavating has been completed. Usually the floor, or invert, is placed first; then concrete for the walls and roof is placed in a single operation.



COURTESY OF ENGINEERING NEWS-RECORD

*Fully lined tunnel is left behind as working shield advances. Rings are curved cast-iron segments bolted together. Platform, at right, is the flying gangway for emergency escape to the tunnel safety lock.*

Traveling steel forms are commonly used for concrete lining. These are built up into sections, as long as 40 ft., to the contour of the desired inner surface. The forms ride on rails and are moved ahead as concreting progresses. They are of two general types, telescoping and nontelescoping. Those of the first type, used when rapid progress is desired, are collapsible to the extent that a section can be telescoped ahead through a section remaining in place while the concrete in the latter hardens. The nontelescoping type is just sufficiently collapsible to permit the section to be freed from the newly placed lining and moved ahead. This operation is much slower, because the form cannot be moved until the section just poured has hardened.

Usually, concrete for the lining is mixed at the surface and hauled to the forms in dump cars. Sometimes the mixer is placed right at the forms, mounted on rails to travel ahead as operations progress. In such cases the aggregate and cement are dry-batched at the surface and delivered to the mixer in properly proportioned charges.

Two methods are in common use for getting the mixed concrete into the narrow space between the form and the tunnel walls and roof. One is to force the mix into place through a pipe by means of a special reciprocating pump. Another method is to shoot the concrete through a pipe with bursts of high-pressure air by means of a pneumatic gun. In both cases the concrete is delivered at the crown and flows around the form into the sidewalls. Pipe sections are removed, or the whole assembly is withdrawn, as the form fills up.

H. W. Ri. and R. H. D.

**TUNNEY, JAMES JOSEPH (GENE)** (1897- ), American pugilist, was born on May 25, 1897, in the Green-

wich Village section of New York City. He was educated at parochial schools and at La Salle Academy. In World War I he joined the United States Marine Corps and served overseas. Tunney first achieved boxing fame in Paris in 1919, when he won the light-heavyweight championship of the American Expeditionary Force. Returning home the same

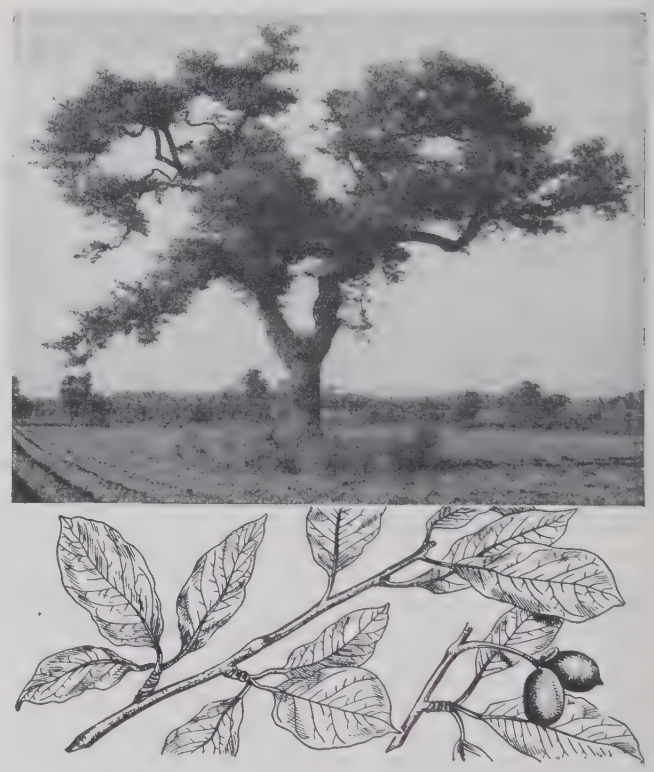
*GENE TUNNEY*

INTERNATIONAL NEWS PHOTO

year, he began his professional career. In 1922 he won the world light-heavyweight title after defeating Battling Levinsky and Georges Carpentier. He later relinquished the title to enter the heavyweight division. Tunney was first matched to fight Jack Dempsey for the heavyweight championship in Philadelphia on Sept. 23, 1926. At that time he had engaged in 60 professional bouts, winning 30 by knockouts, 14 by decisions, and losing only one; the rest were no-decision fights. He lost to Harry Greb in 1922, but Tunney later defeated Greb. In his Philadelphia fight with Dempsey, he won the decision and the championship. At a return bout at Soldiers Field, Chicago, on Sept. 22, 1927, Tunney again was awarded the decision, although many spectators believed he would have lost had Dempsey promptly retired to a neutral corner, when he knocked Tunney down for the famous "long count." He retired from the ring in 1928 and entered a business career. During World War II, as lieutenant commander and later commander in the United States Naval Reserve, he directed the athletic and physical fitness program for the navy. In 1948 he became president of the Gold-Uranium Corporation. G. Q.

**TUPELO** [tu′pəlo], a city in northeastern Mississippi, the county seat of Lee Co., situated about 150 mi. northeast of Jackson. Incorporated in 1872, the city has the aldermanic form of government. Tupelo's economic activities are primarily concerned with the processing of the area's produce, which includes corn, cotton, sweet potatoes, and fruit, dairy products, and livestock. The St. Louis-San Francisco and the Gulf, Mobile and Ohio railroads serve the city. Pop. 1950, 11,527.

**TUPELO,** a name commonly given to an important genus, *Nyssa,* of deciduous trees with a purple or dark blue plumlike fruit. Of the six species, two are found in southern Asia, and the remaining four in the eastern United States, three of which are commercially important. The black tupelo, *N. sylvatica,* also known as the black gum and the pepperidge, occasionally attains a height of 100 ft. It grows from southern Michigan to eastern Texas, and east to the Atlantic Coast, while its variety *biflora,* called swamp tupelo or sour gum, a somewhat smaller tree, is found mostly in the Atlantic Coastal Plain, from Delaware and Maryland to Florida and Texas. In early autumn, these trees are very conspicuous because of the bright red and purple tints of their foliage. The water tupelo, *N. aquatica,* sometimes 100 ft. in height, grows in swamps of the Atlantic Coastal Plain, from Virginia and Florida to Texas, and north in the Mississippi Valley to southern Illinois. Tupelo wood is heavy, hard, and strong; and, because of its close, uniform texture and interlocked grain, which prevent splintering under heavy wear, it is much used for factory floors and platforms. It is used also in building shipping containers and furniture. Tupelo should not be confused



TET BORSIG

*Black tupelo, Nyssa sylvatica, with detail showing leaves and seed pods*

with the tulip wood. The total stand of tupelo saw timber in the United States has been estimated at 14,216,700,000 bd. ft., located mostly in the Gulf states. W. D. B.

**TUPI-GUARANÍ.** *See* INDIAN TRIBES, SOUTH AMERICAN (*Principal Linguistic Families*).

**TUPINAMBA.** *See* INDIAN TRIBES, SOUTH AMERICAN (*Principal Linguistic Families*).

**TUPPER, SIR CHARLES** (1821-1915), Canadian statesman, was born in Amherst, Nova Scotia, July 2, 1821. Educated in Nova Scotia, he later studied medicine at the University of Edinburgh in Scotland. He received his degree in 1843 and returned to Nova Scotia to practice medicine. He became interested in politics and in 1855 was elected to the Nova Scotian Assembly, where he represented Cumberland County for twelve years. From 1864 to 1867 Tupper was premier of Nova Scotia.

Tupper was one of the leaders of the Canadian Confederation movement, and was instrumental in bringing Nova Scotia into the union in 1867. He represented Cumberland in the Canadian House of Commons from 1867 to 1884 and was a member of the Conservative cabinet from 1870 to 1873. Tupper became a leader of the party during the period from 1873 to 1878 when it was in opposition. A year after the Conservatives were returned to power in 1878, Tupper became Minister of Railways and Canals; under his supervision final arrangements were made for the construction of the Canadian Pacific Railway, which was completed in 1885. Tupper was named High Commissioner for Canada in 1883 and, except for fifteen months as Minister of Finance in 1887-1888, retained that office until 1896. During that time he represented Canada at international conferences in Washington, Vienna, and Paris. In 1896 Tupper became prime minister, but when the Conservatives were defeated in the elections of that year he resigned the office. He remained in the House of Commons from 1896 until his defeat in 1900. In January 1901 he retired from the leadership of the Conservative Party. Tupper died at the age of 94 at Bexley Heath, Kent, England, Oct. 30, 1915. He is buried in Halifax. C. B. F.

**TUPPER LAKE,** a village in Franklin Co., in northeastern New York, in the Adirondack Mountains, situated on Tupper Lake and the Raquette River, about 90 mi. northeast of Utica. The village, which was incorporated in 1902, is administered by a mayor and board of trustees. It is the site of a United States veterans' hospital. Near by is the New York State American Legion Mountain Camp. Of interest are the Mount Morris Observatory and Litchfield Castle. The New York Central System provides transportation facilities for the community, which is a year-round resort. The surrounding region is dotted with numerous lakes on which are located many popular winter and summer resorts. Located in a large lumber area, the local industries produce pulpwood, lumber products, and plastics. Pop. 1950, 5,441.

**TURA, COSIMO** [tu′rɑ] (c. 1432-1495), Italian painter, founder of the Ferrarese School, was born at Ferrara about 1432. The first mention of him as a painter is in a document of 1451, when he was working for the family of Este. In 1458, he was officially made painter to the Ferrarese court, and the ducal patronage continued throughout his career until his death in 1495. Tura's work shows an interest in architectural detail and perspective, like that of his contemporary, Andrea Mantegna, as well as a well-developed technique and brilliant color. His frescoes, done for churches and other buildings in Ferrara, have largely disappeared, but an *Annunciation* painted on organ shutters in the Ferrara cathedral still survives, and other examples of his work are preserved in London, Paris, and Rome. B. C. G.

**TURANOSE.** *See* Sugar Chemistry (*Oligosaccharides*).

**TURBELLARIA.** *See* Animal Systematics; Flatworms.

**TURBERVILE, GEORGE** [tɜ′rbərvɪl] (c.1544-c.1597), English poet and translator, was born in Dorsetshire, the son of Henry Turbervile and nephew of Bishop James Turbervile. His family is the one later represented in Thomas Hardy's *Tess of the D'Urbervilles.* He studied at Winchester, at New College, Oxford, and at the Inns of Court. All of his published work appeared between 1565 and 1575. He translated into English verse Ovid's *Heroides,* Mantuan's *Eclogues,* Mancinus' *De Quatuor Virtutibus,* and ten narratives, which appeared in his *Tragical Tales* (c. 1574), from Boccaccio, Bandello, and Plutarch; his two handbooks of sport, *The Booke of Faulconrie, or Hauking* (1575) and *The Noble Arte of Venerie, or Hunting* (c. 1575) also contain much translated material. Turbervile's original poems show the influence of Tottel's *Miscellany,* of Erasmus' *Adagia,* and of various Classical authors. They contain the first collection of Classical epigrams in English, the first extended poetic sequence in honor of a beloved lady, and three lengthy epistles from Russia, descriptive of that country. The circumstances of Turbervile's death are unknown. J. E. H.

**TURBINE** [tɜ′rbɪn; tɜ′rbain], a machine for converting the kinetic energy of a fluid in motion to mechanical energy. The turbine comprises essentially a bladed rotor (curved blades mounted on a shaft) and a casing, mounted with suitable ports, which encloses the rotor. The ports permit the intake and outflow of the fluid, as required. Classification of turbines is based upon the actuating fluid employed, such as water (hydraulic), steam, or gas.

### STEAM TURBINES

A steam turbine is a rotary prime mover that converts the energy of steam into mechanical work or power. The main parts of the turbine are the casing, nozzles, and blading on a rotor. These are suitably arranged to guide the steam for the energy transformation and to obtain useful work from the turbine shaft. Externally-generated steam is piped to the turbine. The pressure and heat energies of the steam are converted into velocity energy, or kinetic energy, in the nozzles. The high-velocity steam from the nozzles impinges on the curved blades fastened to the periphery of rotors (disks centrally located on the shaft). It imparts energy to the rotor by producing a tangential force on it. This force is available to turn the rotor and produce useful mechanical work from the rotor shaft.

**History.** The first recorded use of the ability to obtain work from heat was found in the manuscripts of Heron of Alexandria (second century B.C.) His aeolipile, or ball of Aeolus, illustrated in Fig. 1, consisted of a hollow sphere supported by two tubes above a steam generator in such a manner that the sphere could rotate between the supports. Two open pipes with an L-shape issued from the sphere. These pipes were diametrically opposite each other and midway between the supports. The steam passed through the

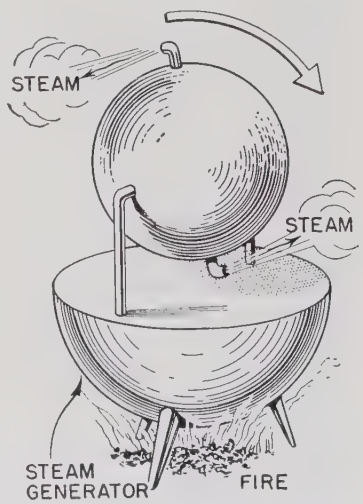


*Fig. 1—HERON'S AEOLIPILE REACTION TURBINE*

supporting tubes into the sphere and issued from the pipes. The resulting reaction on the pipes created a force that turned the sphere on its axis.

In 1629, Giovanni Branca described a device in which the steam issued as a jet from a boiler and impinged upon the vanes of a horizontal wheel (Fig. 2). The forces produced by the impulse of the steam on the vanes turned the wheel.

The principles of the turbine were neglected during the next two centuries. However, the knowledge and use of the energy of steam were exploited in the development of the steam engine. Richard Trevithick in England, about 1800, attempted a "whirling-arm engine" (a reaction turbine of the Heron type) but did not use the steam efficiently enough to compete with the steam engine. In 1831, William Avery patented a similar turbine in the United States. About fifty of Avery's turbines were used in sawmills, and one was installed in a locomotive.

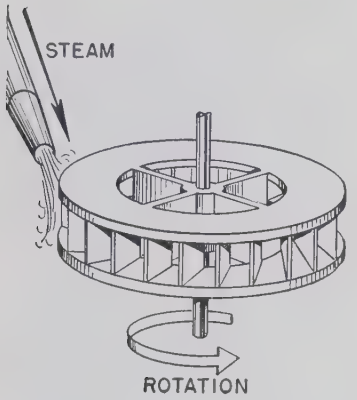

*Fig. 2—BRANCA'S IMPULSE TURBINE*

Others experimented with turbines but had little practical success until 1884. In that year, in England, Charles Parsons invented a practical form of reaction turbine. Carl Gustaf de Laval devised a successful impulse turbine of the Branca type in France in 1889. From this period, the advance of the turbine as a practical prime mover was rapid. A Parsons turbine was installed in the yacht *Turbinia* which drove her at a maximum speed of 34.5 knots in 1897. The success of this unit, together with performance information obtained from complete tests, established the turbine as a prime mover.

In the United States, George Westinghouse (1846-1914) realized the advantages of the high-speed rotary drive. He acquired the American rights to the Parsons turbine in 1895, and secured the services of Francis Hodgkinson of the Parsons staff as a development engineer. The first Westinghouse turbine, a unit of 300 kilowatts capacity, was built to drive an electric generator for use in the Westinghouse manufacturing plant. Electric motors were then substituted for the numerous small steam engines of the plant, wires were used instead of steam pipes, and greater flexibility was obtained. This application rapidly expanded with larger sizes of turbines and generators.

Major developments of turbine types were made by others. In 1896, A. C. Rateau devised the multistage impulse turbine to enable efficient operation at lower rotative speeds than had previously been possible. In the same year, Charles Curtis substituted a single stage of velocity compounding for several stages of pressure compounding. As these and later refinements were made, the output from a single shaft increased.

**Nozzles and Blading.** The pressure and heat energies of steam are converted into velocity energy by expansion of the steam through one or more stationary nozzles in the turbine case. The nozzles are set at an angle to the plane of motion of the turbine blading to direct the steam to the blading on this path. In some designs, the nozzles are formed by stationary blading.

The turbine blades are curved in the direction of the steam flow, and are straight, perpendicular to the direction of flow. The impulse blade (Fig. 3*A*) is symmetrical about its center line parallel to the plane of the rotor. The steam, while passing through the blade, remains at essentially the same velocity relative to the blade. The steam pressure is the same entering and leaving the blade. The reaction blade (Fig. 3*B*) is nonsymmetrical. The blading and passages between the blades are so designed that the steam velocity relative to the blade is increased on passing through the blade with a corresponding pressure drop through the blade.

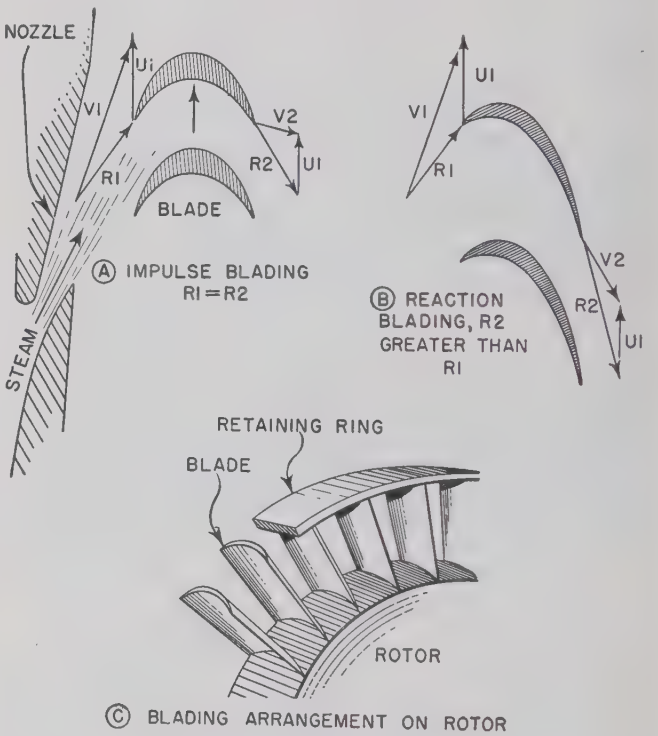

*Fig. 3—TURBINE BLADING*

*(V1) Steam velocity issuing from nozzle; (V2) Absolute velocity of leaving steam; (U1) Blade velocity; (R1) Steam velocity relative to blade, on entering blade; (R2) Steam velocity relative to blade, on leaving blade.*

**Staging.** Turbines are usually designed for direct drives of equipment at usable speeds. The rotor and blade speeds are limited by the strengths of the blading material to resist the action of the centrifugal forces of rotation. In order to utilize the steam velocity in the blading efficiently, the turbine must be multistaged, that is, must have more than one nozzle ring and more than one row of blading. By incorporating a series of nozzle rings and blades, the energy is transformed in steps with a partial steam expansion from the initial pressure to the final pressure in each step. In all staging, the cross-sectional area of steam flow increases in each stage. Larger nozzles and longer blades are required to take care of the increased steam volume, due to expansion.

Simple pressure staging (Rateau type) consists of sets of nozzles and blades of the impulse type. The steam expands in each nozzle bank in increments. In velocity staging (Curtis type), the pressure reduction is accomplished in one nozzle bank. The exit steam from the first row of moving impulse blades is redirected by stationary blades to act on a

second row of moving impulse blades. The velocity energy is utilized in steps in each set of moving blades. In re-entry velocity compounding, the steam is redirected to the same row of blades by helical or sinusoidal channels in the casing.

Staging in a reaction turbine is accomplished by stationary converging blades between rows of moving blades. These redirect the steam to maintain the same absolute entrance velocity to each set of moving blades.

Large turbines are usually made up of successive stages of combinations of the different staging types, depending upon the operating conditions.

**Steam Cycles.** *Rankine Cycle.* A turbine that operates on the Rankine cycle (Fig. 4*A*) receives steam at the line pressure and temperature. The steam flows through the turbine with no steam loss, other than that due to unavoidable leakage, and with no additional heat added to the steam.

*Reheat Cycle.* In the *reheat cycle* (Fig. 4*B*), the steam, after passing through the initial stages of the turbine, is brought out to a heat exchanger where additional heat energy is added. It then returns to the turbine to pass through the remainder of the stages for further extraction of energy. Higher temperatures are thus maintained in this turbine for increased efficiency.

*Energy from Exhaust Steam.* The exhaust steam from the turbine contains a useful amount of energy that normally is dissipated in the condenser. This energy is necessary to

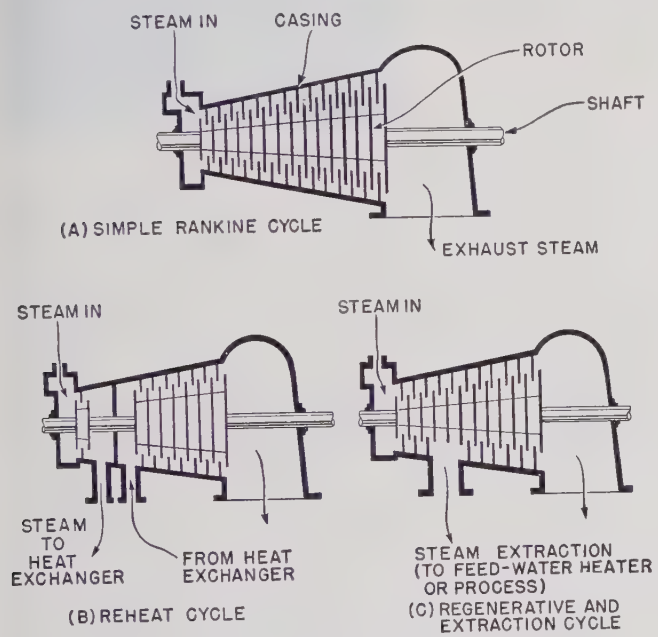

*Fig. 4—TURBINE STEAM CYCLES*

condense the steam for exhaust pressures below atmospheric and to permit rejection of the steam in the form of water. Some of this energy may be harnessed by bleeding portions of the steam at different stages of the turbine (Fig. 4*C*), then used in boiler feed-water heaters or for industrial heating. The major portion of the steam passes through the turbine. If the extracted steam is used entirely for feed-water heating, the cycle is termed regenerative. If used for other purposes the cycle is termed extraction or bleeder.

**Special Arrangements.** Since the steam volume increases on expansion, the low-pressure stages become large in diameter to accommodate the volume flowing. These diameters are limited by the maximum allowable stresses in the blading and rotor produced by the centrifugal action of rotation. In multiflow units (Fig. 5), the steam first goes through a high-pressure unit. Then it is divided to pass through two or more low-pressure units, each of which provides adequate passage for a portion of the initial steam flow. In some cases the low-pressure units are on the same shaft and in the same casing as the high-pressure unit. The arrangement may be parallel double flow, opposed double flow, or semidouble flow. If the low-pressure casings are separate from the high-pressure, the units are said to be compounded.

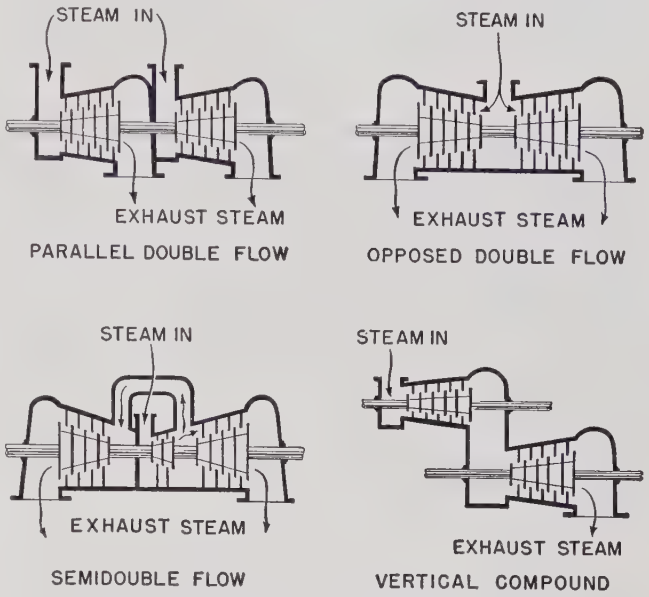

*Fig. 5—ARRANGEMENTS OF MULTIFLOW TURBINE UNITS*

A turbine that uses steam initially at high pressures, 1,200 lb. per square inch or more, is referred to as a "high-pressure turbine." This unit is specially designed and is usually segregated from the regular turbine system in some compounded arrangement. Economy and maximum load of existing low-pressure generation plants is sometimes improved by the addition of a high-pressure plant. A high-pressure turbine, or topping turbine, is installed, usually above the existing low-pressure turbine. The exhaust steam from the high-pressure turbine then feeds the low pressure turbine, together with steam from the original steam-generation system.

Back-pressure turbines exhaust the steam to a pressure higher than atmospheric, to use the heat of the exhaust in industrial processing or heating.

*Applications.* The necessary high rotative speeds of turbines for efficient operation limits their use, when coupled directly to the driven machine, to equipment that can operate at these speeds. Electric generators in central power plants, designed for speeds of 1,800 or 3,600 r.p.m., are suited to this type of drive. The turbine-generator combination is rated in terms of the electrical power output of the generator in kilowatts. Other direct-drive applications are centrifugal blowers, centrifugal pumps, fans, and centrifuges.

Slow-speed rotary equipment may be driven by the higher speed turbines through reduction gears, as in marine practice where the propellers of ships rotate at speeds from 60 to 400 r.p.m. for efficient propulsion.

## HYDRAULIC TURBINES

The hydraulic turbine is the prime mover for water-power developments. It was introduced near the beginning of the

nineteenth century as the means of producing more power from flowing water than could be obtained by water wheels, the latter being limited to a controlled change in water elevation of about the same distance as the diameter of the wheel. Modern hydraulic turbines consist of a wheel with attached buckets or blades rotating in a closed scroll or case, devices to guide the water at proper angles into and/or out of the rotating wheel, the shaft, and bearings. The shaft is connected to the power-using equipment, usually an electric generator in modern hydroelectric plants. Auxiliary devices as speed governors, water-hammer surge protectors, and trash racks are important parts of a hydraulic turbine installation.

### GAS TURBINES

A gas turbine is a machine for producing mechanical power, the principal working element of which is a bladed rotor actuated by streaming gas expanding from a higher to a lower pressure. Gas and steam turbines operate on the same principle and are similar in design. Usage also sanctions "gas turbine" to mean "gas-turbine power plant," a complete power-producing unit embodying means for combustion of fuel. *See also* AIRCRAFT PROPULSION; ELECTRIC-GENERATING POWER PLANTS; POWER PLANTS; SHIP PROPULSION; WATER POWER. H. W. I., R. G. F., and E. M. F.

**TURBOJET ENGINE.** *See* AIRCRAFT PROPULSION (*Gas Turbine Engines*).

**TURBOPROP ENGINE.** *See* AIRCRAFT PROPULSION (*Gas Turbine Engines*).

**TURBOT** [tɜ′rbət], *Rhombus maximus,* a large European flatfish of the family Bothidae, found in coastal waters from Scotland and Denmark south to the Mediterranean and Black Seas. It is characterized by a diamond-shaped, brownish-colored body, and scaleless skin covered by blunt tubercles on the left side. Like other flatfishes, the turbot has its eyes located on the left side of the head. It spawns in the spring or early summer, the females depositing about 10,000,000 eggs. A good food fish, the turbot weighs from 30 to 40 lb., but some may attain a weight of 70 lb. E. C. R.

**TURENNE. HENRI DE LA TOUR D'AUVERGNE, VICOMTE DE TURENNE** [tü′rɛ′n] (1611-1675), French military leader, was born at Sedan, Sept. 11, 1611. He served under his uncles, Maurice and Henri of Nassau, and soon distinguished himself in the French campaigns of the Thirty Years' War. Made marshal of France at the age of 32, he was, with Condé, the leading French general in the campaigns which brought the war to an end. In the wars of the Fronde, Turenne took sides against the Mazarin Regency, but reconciled himself afterward with the French Crown, and took command in the ensuing war with the Spaniards, thus becoming the adversary of Condé. He defeated Condé decisively in the Battle of the Dunes near Dunkirk in 1658. Louis XIV made him supreme commander of the French armies. In 1667 Turenne conquered a part of Flanders and Hainault in the war against Holland, and had brilliant successes in the second war against the Dutch and their allies, which began in 1672. He was especially successful against the troops of the Great Elector of Brandenburg and against the imperial troops under Montecucculi. He was killed in the Battle of Sasbach in Baden, July 27, 1675. Turenne refined his military art from campaign to campaign. In character he was both strong and gentle. Originally a Protestant, he abhorred the divisions within Christianity and in 1668, under the influence of Bossuet and his nephew the Abbé de Bouillon, was converted to the Catholic faith. W. Fr.

**TURGENEV, IVAN SERGEYEVICH** [tʊrge′nyəf] (1818-1883), Russian novelist, was born at Orel, of an old landowning family. He attended courses in philology at the universities of Moscow and St. Petersburg (1833-1838), and in 1838 went to Berlin to study philosophy. In Germany Turgenev actively participated in discussion groups of Russian students and became imbued with the ideas of Western liberalism. While still a student at the University of St. Petersburg, he began to write poetry. His first poems,

*IVAN SERGEYEVICH TURGENEV*

FROM A PAINTING BY ILYA EFIMOVICH REPIN

BROWN BROTHERS

published in 1837 in the liberal magazine *Sovreménnik* ("Contemporary"), were rather inept imitations of Byron. His long tale in verse, *Parasha* (1843), betraying a strong influence of Pushkin, was highly praised by Belinsky, the leading Russian critic of the time. However, it was in prose fiction that Turgenev scored his great successes. His first work of real distinction was *Notes of a Sportsman,* a collection of short stories, written between 1847 and 1851, but published in book form in 1852. These picturesque sketches of Russian country life, which were permeated with sympathy for the destitute peasants, were received as a plea for the abolition of serfdom. Turgenev's literary activity soon became most productive. He published a number of longer tales, such as *Asya, Correspondence, Faust, First Love,* and four full-length novels, *Rudin, A Nest of Gentlefolk, On the Eve,* and *Fathers and Sons,* that placed him among the foremost Russian writers of his time. *Rudin* (1856) portrays a Russian radical of the 1840's, a brilliant talker and a forceful propagandist, who proves, however, fatally unable to translate his resounding words into action. *A Nest of Gentlefolk* (1858) relates the tale of unhappy love and unhappy marriage, in the idyllic setting of an old-fashioned Russian manor house. *On the Eve* (1860) presents the type of a new Russian woman, energetic and brave, in quest of an ideal for purposeful social action. The figure of a strong man, significantly absent from most of Turgenev's works, appears in his best-known novel, *Fathers and Sons* (1862). The conflict between the old and the new is personified here by the dramatic showdown between Pavel Kirsanov, a genteel traditionalist, and Eugene Bazarov, a nihilist, a harsh and uncompromising champion of science and progress. Turgenev's treatment of Bazarov stirred wide controversy, in which the author was vehemently attacked by radicals and conservatives alike. His bitterness,

engendered by these partisan and often unfair criticisms, may have prompted Turgenev's decision to settle abroad. After 1863 he lived mostly in western Europe, first in Germany and then in France with the family of a celebrated Spanish singer, Pauline Garcia-Viardot. Mme. Viardot, whom Turgenev had first met in 1843, was the object of his lifelong affection. In Paris Turgenev found the French literary elite to be more appreciative of his art than most of his Russian compeers; such writers as Flaubert, the Goncourts, and Zola were among his friends and admirers. Growing alienation from Russian public opinion found its expression in *Smoke* (1867), in which the author strikes out mercilessly at reactionary Slavophiles, as well as at radical Westerners. Turgenev's last novel, *Virgin Soil* (1877), was apparently an earnest but hardly successful attempt at an objective portrayal of the rising Russian revolutionary movement. Much more satisfactory, in artistry and psychological insight, are numerous stories published during the same period, such as *Spring Torrents* (1871), *A Queer Story* (1869), and *Song of Triumphant Love* (1881). Most of these works are nostalgic reminiscences of the days gone by, and some of his late tales are slightly tinged with mysticism. He died on Sept. 3, 1883, at Bougival, near Paris; he was buried in St. Petersburg. Huge crowds of his countrymen came to the funeral to pay tribute to the great writer.

Turgenev's work lacks the epic power of Tolstoy and the searching, uncanny penetration of Dostoyevsky. He was, nevertheless, an astute observer of the human psyche and, above all, a consummate artist who managed to combine clarity and precision with emotional suggestiveness. The most romantic of all Russian realists, he had a great gift for conveying a mood, and his exquisite landscape passages, rich in lyrical undertones, heighten the evocative power of his tales.

A sincere humanitarian and liberal, Turgenev loathed tyranny and oppression. His was, however, rather a contemplative than an active nature, and more often than not he chose to keep aloof from the political battles of his time. Keenly aware though he was of current social issues, Turgenev was mainly preoccupied with psychological problems, centering around love, its ecstatic joys and bitter disappointments, and the central theme of his writings is man's quest for individual happiness and his inability to attain it.

V. E.

**TURGOT, ANNE ROBERT JACQUES, BARON DE L'AULNE** [tü'rgo'] (1727-1781), French statesman, economist, and reformer, was born in Paris on May 10, 1727. He was educated for the priesthood, later attending the Sorbonne (1749-1750). Turgot subsequently declined to take holy orders, and began his studies in economics, particularly the physiocratic system of François Quesnay and Vincent de Gournay. In 1752 he became councilor of the parliament. While on a tour of inspection of the French provinces in 1760, he began his friendship with Voltaire. Appointed to the post of intendant of Limoges (1771-1773), he applied many theories of the physiocratic school and in 1766 wrote one of his best known works, *Réflexions sur la formation et la distribution des richesses.* Turgot advocated complete freedom of commerce and industry, with taxation only on the net product of the land. Many of Turgot's ideas were adapted by Adam Smith in his *Wealth of Nations.*

In 1774 Turgot was successively minister of marine and comptroller general under Louis XVI. He made an immediate attempt to restore the tottering finances of the government by a process of rigid economy. He proceeded on the principle: "No bankruptcy, no increase of taxation, no borrowing." His policies and methods roused considerable opposition, which was brought to a head by his Six Edicts of 1776; these related (1) to the ending of forced levies of the peasantry for work on public highways, instituting instead construction for a money price; (2) declaration on the grain trade and the suppression or moderation of grain taxes; (3) the suppression of offices connected with certain ports and markets; (4) the suppression of craft guilds; (5) the suppression of the exchange of Poissy; and (6) changes in the taxes on suet (tallow). The nobility, the clergy, and the officers of the Crown were opposed to these edicts, and on May 12, 1776, the King asked for Turgot's resignation. He spent the remaining years of his life in Paris in scientific and literary studies. Turgot died there on Mar. 18, 1781.

Turgot was one of the leaders in the economic interpretation of history, much of his work having to do with permanent principles rather than with changing social forms. He has been called the founder of our present political economy, but he left no comprehensive statement of his economic theories. He foresaw the French and the Industrial revolutions and warmly advocated many doctrines of the Physiocrats, though his exact relationship to them is still a matter of controversy. The fate of Turgot and his reforms, all of which were abolished after he left office, proved that the French monarchy was then both incapable of and unwilling to reform.

T. R. H.

**TURI.** *See* Asiatic Tribes (*Indo-Iranian*).

**TURIN** or **TORINO** [tyu'rin, tyuri'n; tori'no], the capital city of the province of the same name in the region of Piedmont, northwest Italy.

**The City.** Turin lies 75 mi. southwest of Milan, on the left bank of the Po River at the confluence of the Dora Riparia, at an elevation of 775 ft. The city is situated on a rolling plain at the foot of the Alps. Across the Po to the east there is a line of hills having heights exceeding 2,000 ft.

Turin is one of Italy's leading industrial centers; in 1950 more than 200,000 workers were employed in the city's numerous factories. Much of the motive power is supplied by electricity from the near-by mountain streams. The city's principal products are automobiles, arms, machinery, clothing, textiles, chocolate, chemicals, and printed matter. Because of its industrial and commercial importance Turin was heavily bombed by the Allied air forces during World War II.

Turin came into being as the *Augusta Taurinorum,* a military colony of the Romans. During the Germanic invasions it fell under Goth, Lombard, and Frankish rule, and later the city was contested among various regional feudal lords. The Counts of Savoy asserted claims to the city which they were finally able to make good in the thirteenth century. In the sixteenth century they made Turin their capital, and in the nineteenth century the city became the intellectual and political center of the movement to free Italy from foreign domination and unite it under the House of Savoy. Pop. (off. est. 1947), 713,735.

**The Province.** The province of Turin, comprising 301 communes, has an area of 2,693 sq. mi. Small territorial changes were made along the Italo-French frontier in the Alps by the treaty of peace ratified in September 1947. The province consists partly of mountains and partly of the upper Po plain. It is entirely drained by the Po and its tributaries, and has a continental climate. The chief agricultural products are wheat, corn barley, potatoes, hay, wine, and a wide variety of fruits and vegetables. The raising of live-

stock is also important. Much of the land is irrigated. Several towns besides Turin have become industrially developed and produce machinery, vehicles, furniture, chemicals, foodstuffs, and paper. The only city in the province, aside from Turin and its suburbs, to attain a population of more than 10,000 is Pinerolo (pop. 21,600). Pop. (off. est. 1947), 1,388,000. *See also* PIEDMONT; SAVOY, HOUSE OF.

R. G. W.

**TURIN, UNIVERSITY OF,** an institution of higher learning at Turin, Italy, founded in 1404 by Louis, Duke of Savoy-Acaja. Pope Benedict XIII, the antipope of Avignon, recognized the school by papal bull in 1405, and Sigismund, Emperor of the Holy Roman Empire, issued a royal charter, in the name of the university, in 1412. In 1413 Pope John XXIII granted the young institution juridical recognition. Under Amadeus VIII, Count of Savoy, reforms were introduced in 1424 and it was reorganized in 1431. During the following four centuries its career was marked by many upsets. It was closed in 1536 when the Franco-Spanish war began. Turin was revived in 1566, and by 1571 it had acquired twenty-six chairs. When it was removed to its present palatial location in 1720 it had the faculties of theology, law, medicine, and arts. In 1729 the Botanic Garden, Maternity Institute, science laboratories, and the chair of oriental languages were established. During the French invasion in 1792 the university was closed; by 1814 it was again active. In 1855 the museum of anatomy and pathology was founded. Other institutes were successively added: astronomy (1864), general pathology and forensic medicine (1873), juridical (1882), and the science institute of Angelo Mosso (1907). The scope of instruction in 1950 included jurisprudence, economics and commerce, letters and philosophy, pedagogics, medicine and surgery, mathematics, physics and natural science, pharmacy, veterinary medicine, and agriculture. Nine faculties had a total membership of 199; student enrollment was 12,473. The library housed 181,041 volumes, 1,000 incunabula, and the Napoleonic collection of 30,000 volumes. A. L. H.-Q.

**TURK.** *See* ASIATIC TRIBES (*Ural-Altaic*).
**TURKANA.** *See* AFRICAN PEOPLES.

**TURKESTAN** [tɜ′rkɪsta′n], a vast region of central Asia stretching from the Caspian Sea, on the west, to Mongolia and central China, on the east, and from Siberia, on the north, to Tibet, India, Afghanistan, and Iran, on the south. Almost the entire territory lies today within the boundaries of the Soviet Union and China; a relatively small portion forms the northern part of Afghanistan.

Shortly before the beginning of the Christian Era most of Turkestan was inhabited by Aryans and Ural-Altaians. The Chinese began their penetration of the region about 100 B.C., and they dominated the political and cultural development of eastern Turkestan until the seventh century. The peoples of this region were largely nomadic, although in the oases and along the rivers many practiced agriculture. Gradually, as the caravan trade developed, cities arose in the southern part of Turkestan, notably Kashgar, Tashkent, and Samarkand. Meanwhile, by the end of the fifth century, a considerable part of western Turkestan had come under the rule of the Ephthalite Huns. From then until modern times the history of Turkestan has been one of almost continual struggles among rival Asiatic tribes and religious factions. For a while after the seventh century Tibet, aided by the western Turks, ruled a large part of southern Turkestan. Then, later in the eighth century, Mohammedan tribesmen swept eastward through almost the entire length of Turkestan. Three centuries later Genghis Khan and his Mongol horde invaded it from the opposite direction. Local wars between rival Moslem factions continued in much of the region until the seventeenth century, when the Chinese again pushed westward and conquered almost all of the eastern half. Although the Turks continued to resist, the Chinese province of Sinkiang was established in 1881, politically consolidating the area. Until the middle of the twentieth century, however, sporadic Moslem rebellions occurred.

Russia gradually extended its sway over western Turkestan until, in 1865, its domination was virtually complete. Under the imperial regime western Turkestan became a governor-generalship comprising several khanates. After the Revolution of 1917, these political divisions were destroyed and new ones were established on the basis of racial distribution. The main territorial units were Turkmenistan, Tadzhikistan, and Uzbekistan, although parts of Turkestan were given to Kazakhstan and Kirghizia. In 1925 a political reorganization occurred, and today western Turkestan is divided among the Turkmen, Kirghiz, Uzbek, and Tadzhik constituent republics of the Soviet Union.

That part of Turkestan lying within Afghanistan is about 500 mi. long and 100 mi. wide. It is situated along the Amu Darya. Except in the river valley, most of the territory is wasteland. Its chief city is Mazar-i-Sharif. Russia disputed Afghan control of the area until 1859. G. Q.

**TURKEY,** a republic located principally in southwestern Asia but embracing a smaller extent of territory in southeastern Europe. It has an important and strategic location, lying as it does across the Dardanelles, the Sea of Marmara, and the Bosporus, which form the only water route between the Black Sea and the Mediterranean and which separate Turkey in Asia, known as Anatolia, from Turkey in Europe, known as Eastern Thrace. Turkey in Europe is bounded on the north by Bulgaria, on the east by the Black Sea and the Bosporus, on the south by the Sea of Marmara and the Dardanelles, and on the west by Greece and the Aegean Sea. Türkey in Asia is bounded on the north by the Black Sea and the Soviet Union, on the east by the Soviet Union and Iran, on the south by Iraq, Syria, and the Mediterranean, and on the west by the Aegean Sea. The total area of Turkey is 296,190 sq. mi., of which 9,260 sq. mi. are in Europe.

## GEOGRAPHICAL FEATURES

**Topography.** Turkey is composed of the central plateau of Anatolia, which has an average altitude of from 2,500 ft. to 3,000 ft. and is bordered on the north, south, and east by mountains. The Şmali Anadolu Dağlari are on the north and the Toros Dağlari (Taurus Mountains) on the south. Eastern Turkey is dominated by the high, rugged mountains of Armenia. This eastern section, which has many lava areas, centers in Mount Ararat, with an elevation of 16,945 ft. above sea level. The surface of the large Lake Van in eastern Turkey is 5,300 ft. above sea level. Western Turkey has a fringed or drowned coast line with many rocky peninsulas and small bay-head plains, and there are a large number of offshore islands formed by drowned summits of the Şmali Anadolu and Taurus mountains. The southern or Mediterranean coast is somewhat similar, having a very narrow coastal plain backed by the spectacular Taurus Mountains. The Black Sea coastal plain is also narrow and backed by mountains, but is more regular and has fewer harbors.

**Lakes and Rivers.** Turkey has a large number of lakes, of which Tuz, in the central part, and Van, in the east, are

*A view of the Bosporus, the narrow strait which divides European from Asiatic Turkey. On the left are the palace and gardens of the sultans of the Ottoman Empire.*

the largest. Most of the rivers of Turkey are short torrential streams that flow from the coastal mountains into the sea, but several important river systems, such as those of the Sakarya and Kizil rivers, flow generally northward across the plateau and empty into the Black Sea. In the extreme east are the headwater systems of the Euphrates and Tigris rivers, flowing southeastward. Of the rivers that empty into the Mediterranean Sea, the Ceyhan system, on which the city of Adana is located, is the most important; the Büyük Menderes (the classical Meander) and Gediz are the principal rivers flowing westward into the Aegean Sea. The Kizil (the classical Halys) is the longest river in the country; half its course is saline.

**Minerals.** The bituminous coal reserves are estimated at 200-300 million tons and are quite possibly even larger. Next to the Soviet Union, Turkey is the world's largest producer of chrome ore.

The mining and manufacturing of coal, iron, and copper are a state monopoly. Several less important minerals are also produced in Turkey, among them manganese, boracite, sulphur, lead, asbestos, emery, and salt.

**Soil.** The soil of Turkey varies considerably in fertility. The soil of the interior reflects the semiarid steppe conditions of the region. Here low rainfall coupled with a sparse plant cover of short grasses has resulted in the formation of lime-accumulating steppe soils, derived from volcanic and limestone parent materials. The character of the terrain handicaps the development of deep natural soils in this highland area, and most of the soil is thin and easily eroded. Overgrazing and deforestation of the slope lands have led to an intensification of the problem of soil erosion. More productive soil is found in the coastal and lowlands regions of Turkey; here relatively flat land and more humid conditions have made for better agricultural output. The best soil is found in the alluvial valleys where newly deposited river materials are rich in minerals and organic content, but these regions are limited and isolated in extent.

**Climate.** Most of Turkey has a semiarid climate with extremes of temperature. Almost all of the Anatolian plateau has an average annual rainfall of only 20 in. or less, and has hot, dry, dusty summers, and cold, windy, damp winters. In the east, in the Armenian Knot region, the winters are long and severe, with a heavy snowfall, and the summers are short and cool. The narrow Mediterranean and Aegean coastal plains have a warm, Mediterranean climate, with short, wet winters and long, warm, sunny summers. Along the coast the January average temperature is about 50° F., and the July average about 80° F. There is about 30 in. of rainfall. The Black Sea coast is colder than the Mediterranean coast, and receives around 100 in. of rain a year.

**Flora.** Because of the variations in climate and relief, there are several different vegetation types in Turkey. Most of the Anatolian plateau is a steppe or grassland with a few dwarf trees. In the springtime, the steppe is covered with flowering plants. The Aegean and Mediterranean coasts have the usual Mediterranean flora, with pines, thorny bushes, myrtles and oleanders, scrub oaks, and palms. The Black Sea coast has a large stand of deciduous forest.

**Fauna.** Because of its position, Turkey is a meeting place for the various animal species found in Europe, Asia, and Africa. Differences between the animal varieties found in Turkey in Europe as opposed to Turkey in Asia are not too significant. The most important wild animals are the bear, boar, corsac, deer, fox, gazelle, hyena, jackal, leopard, lion, lynx, and wolf and the many varieties of rodents that frequent the steppes. Among the birds the more common are

MONSELL FROM BLACK STAR

*The interior of this 80-ft. cone of volcanic rock, a monolithic monastery in the Cappadocian mountains of central Turkey, is honeycombed with cells and passages.*

the bittern, bustard, eagle, sand grouse, partridge, pheasant, stork, and swan. Fish, both fresh-water and salt-water varieties, form an important source of food for the Turkish people. The ass, buffalo, camel, Angora goat, ox, and sheep are common. J. E. F. and A. L. R.

## ETHNOLOGY AND POPULATION

**Origin of Inhabitants.** The position of Turkey as a crossroad between Asia and Europe has allowed extensive intermingling of peoples. There is considerable doubt about the origin of the earliest inhabitants, but the available evidence indicates that physically they were very similar to the Alpine subrace of Europe, although modified subsequently by infiltrations of Gauls and Semites. In later times, when the country was subject to the Macedonian, Roman, Byzantine, and Ottoman empires, elements from the Balkans and other provinces were introduced.

*Turkish Elements.* The Turks are believed to have come to Anatolia from the region in Asia between the Ural and Altai mountains, where they had intermarried with the Mongols. The Turkish nomads, who became Moslems during their westward migration, invaded and settled Anatolia by a slow process of infiltration. They gradually spread to the surrounding coastal areas, assimilating the inhabitants in respect to both language and religion.

With the Turkish penetration into the Balkans in the middle of the fourteenth century, and especially after the fall of Constantinople in 1453, the government settled many Turks in this area in order to effect a Turkification of the native population. However, these efforts were strongly resisted by all of the Christian peoples. Even those Balkan groups—the Bosnian Slavs, Albanians, and Bulgarian Pomaks—who adopted Islam were not assimilated and Turkish influence began to decline in the nineteenth century.

*Minorities.* The modern Turkish government, with its strong emphasis upon Turkification, altered the composition of the population to a great degree. One large minority, the Armenians, had been almost completely obliterated during the last part of the nineteenth century and the early part of the twentieth century. Although the Treaty of Berlin (1878) imposed upon the sultan of Turkey the obligation to give social, economic, and political security to the Armenian people, he permitted the slaughter of hundreds of thousands in the brief period between 1894 and 1896. In the spring of 1909 several thousand Armenians were killed. In June and July 1915 systematic massacre and expulsion of Armenians were undertaken; many were driven into the Syrian Desert. In 1915 only about 100,000 Armenians remained in Turkey.

Following World War I, an exchange of population was carried out with Greece, and 400,000 Turks in Greece were sent to Turkey. This transfer, carried out by the League of Nations, was unique in the history of the world. The largest minority in modern Turkey are the Kurds, a nomadic people who live in the eastern part of Turkey and also in contiguous parts of Iran and Iraq (a region sometimes collectively called Kurdistan). Accustomed to almost complete independence, the Kurds resisted the growing strength of the Turkish Republic, which antagonized them by abrogating Moslem laws and customs. They revolted in 1925, but the rebellion was quickly and ruthlessly crushed, and, since then, their tribal autonomy has disappeared. A special regime was set up in Kurdish vilayets after the rebellion, and it was not until December 1946 that they were given the same status as other vilayets in Turkey. Although many Turkish leaders consider the Kurdish question as having been solved, the problem of Kurdish nationalism has not been eliminated. The proximity of these Kurds to the border of the Soviet Union adds to the significance of their nationalism.

The largest Turkish minorities outside Turkey are those of Bulgaria (500,000), Romania (200,000), Yugoslavia (150,000), and Greece (80,000). Bulgaria has expelled many thousands of Turks, who sought asylum in Turkey. During the 1930's Turkey absorbed annually between 10,000 and 30,000 Turkish émigrés from the Balkan states. In Turkey itself the Turks form about 84 per cent of the population; the Kurds, 10 per cent; Greeks, 2 per cent; Bulgarians, 1.5 per cent; and Yugoslavs, 1 per cent.

**Language.** Osmanli, or Ottoman Turkish, belongs to the Altaic family of languages, spoken in most of central and northern Asia, and is related to the Magyar and Finnish languages. It was written in Arabic script until 1926, when the Roman alphabet was substituted in official correspondence; in 1928 the Roman alphabet was adopted for universal use. The official name of the language is no longer Osmanli, but *türk dili,* the Turkish language.

**Religion.** Although Islam was abolished as the state religion in 1928, 98 per cent of the people are still Moslems. Turkish has been substituted for Arabic as the liturgical language in all mosques, and the present law forbids the wearing of clerical garb except in places of worship and during divine services.

İstanbul is the seat of the Ecumenical Patriarch, who is the head of the Orthodox Church in Turkey. The Armenian Church (Gregorian) is ruled by a Patriarch in İstanbul; the

Uniat Armenian Church by the Patriarch of Cilicia; the Chaldaeans by a Bishop of Mardin; the Latins by an Apostolic Delegate in İstanbul and the Archbishop of İzmir; and for the Jews there is a Grand Rabbi in İstanbul.

**Population.** The census of 1950 placed the population at 20,934,670. The average annual rate of increase for the population is 23 per thousand, one of the highest in the world, and it is reported that the average number of children per family is six. In 1950, 1,626,229 inhabitants lived in European Turkey and 19,308,441 in Anatolia.

The northern and western vilayets and the coastal areas are the most densely populated, whereas the central plateau is very sparsely populated. There are also large nomadic tribes, especially the Kurds. The average density is 64 per sq. mi., one of the lowest in the world. The most densely populated provinces are İstanbul (199), Trabzon (152), and Hatay (120). According to the 1950 census the major cities were: Istanbul, 1,000,022; Ankara, 286,781; Izmir (Smyrna), 230,508; Adana, 117,799; and Bursa, 100,007.

## GOVERNMENT AND POLITICS

**Structure of Government.** The Constitution of 1924, which was drawn up by Kemal Atatürk, declares that Turkey is a republic with a president as the head of the state. The sovereignty lies with the people, and the supreme legislative authority is vested in a single chamber, known as the Grand National Assembly, which is elected by universal suffrage. The deputies, who are elected for terms of four years, elect the president of the republic and the chairman of the parliament. The president chooses the prime minister, is supreme commander of the armed forces, and is charged with putting into effect, within ten days, the laws passed by the parliament. He may return a bill to the Assembly for reconsideration, but must sign it if the parliament reaffirms its decision. Secret ballot and open-count are assured for all elections.

The Assembly meets annually at a fixed date and remains in session for at least six months. Its functions are to make and amend, abrogate and interpret laws, to conclude treaties with foreign countries, declare war, approve the state budget, safeguard the legal tender, and decree amnesties. It is also responsible for all financial matters and for judicial investigations. There is one deputy for every 40,000 people. (For the elections of 1954 there were 541 seats.) Although the constitution vests executive and legislative power in the Assembly, that body formally delegates executive power to the cabinet, and it is exercised directly by the president, who thus, in practice, has absolute powers. The 1924 constitution guarantees the courts of law full independence.

**Political Movements.** The Republican People's Party, which was founded by Kemal Atatürk, had no genuine opposition until the appearance in the summer of 1945 of the Democratic Party under the leadership of the former Premier Celâl Bayar. Formation of this party was not a result of its leaders' disagreement with the aims of the Kemalist revolution but of dissatisfaction with the manner in which the Republican People's Party was carrying out these aims. In general, the Democratic Party has worked for liberal reforms within the Kemalist framework. The Republican People's Party stands for the differentiation of Turkish society along professional rather than class lines, for a substantial although not exclusive participation of the state in the economic life of the nation, for the encouragement of credit and consumers' co-operatives, for the prohibition of strikes and lockouts, for a stringent state control over trusts and cartels, and for secular education. However, in the course of its authoritarian rule this party promulgated a series of laws which are regarded as denying many privileges and rights guaranteed by the Constitution of 1924.

However, opposition parties have come to the fore, and in the first free election, in May 1950, Celâl Bayar, leader of the Democratic Party, was elected president of Turkey, succeeding General İsmet İnonu, who had served since 1938. On Feb. 20, 1952, the Peasant Party was formed; there are 18 other splinter parties.

**Local Government.** Turkey is divided into 63 İl (vilayets), which are subdivided into İlçe, and these in turn are divided into bucak. A vali, representing the government, is at the head of each of the vilayets.

**Finances.** Although Turkey has received loans from the United States, Great Britain, and France, it has also stabilized its economy since World War II. From the United States it has received grants for military and reconstruction purposes, and from the International Bank it has obtained a loan of about $25,000,000 for the construction of the Seyhan River Dam. In 1944 Turkey paid its last installment on the war debt set by the Treaty of Lausanne. A law of 1951 guaranteed foreign investment and industries that promised to develop Turkish economy, and in 1954 another law denationalized Turkey's oil reserves, so that foreign companies could negotiate contracts on the basis of a 50 per cent share of the profits. In 1955 the lira was valued at 35 cents.

**International Relations.** Before World War II, Turkey maintained very friendly relations with Yugoslavia, Romania, and Greece, and with them had concluded the Balkan Pact in 1934. Relations with Bulgaria were periodically tense, although an agreement in 1925 for the emigration of Turks from Bulgaria was signed and for the most part adhered to. The friendly relations established by Lenin and Kemal continued through most of the interwar period, not beginning to deteriorate until after the conclusion of the Nazi-Soviet pact in 1939. Relations with the Arab countries were cool because of Arab resentment of the Kemalist program, which was regarded as inimical to the traditional institutions of Islam. After the Italian plunge into Ethiopia in 1935, Turkey gradually turned to Great Britain and France, and in the next few years concluded various agreements with them, signing the formal treaty of mutual assistance in October 1939. After World War II there was some improvement in relations with the Arab countries. Turkey was among the first states to recognize the independence of Syria and Lebanon. However, the Syrians have not reconciled themselves to the loss of the Sanjak Alexandretta (Hatay), which France surrendered to Turkey in 1939. Turkey was an original member of the United Nations, and in 1951 was elected to the Security Council. In 1954 Turkey signed a security pact with Pakistan, which was later extended to include Iraq and Iran. Turkish representatives attended the Rome and Ottawa conferences of the North Atlantic Treaty Organization (NATO), which it entered on Feb. 18, 1952, despite the warnings and protests of the Soviet Union. In the summer of 1952 discussions were held with the Yugoslav and Greek governments, and in May 1953 the Assembly ratified a treaty of friendship and cooperation among the three countries. On Aug. 9, 1954, Yugoslavia, Greece, and Turkey signed a military alliance; but relationships between the Greek and Turkish governments were marred by opposing positions taken concerning the status of the British-held island of Cyprus, whose Greek majority agitated for union with Greece, while a Turkish minority supported the British.

**Defense.** Following World War II Turkey's armed

forces were extensively reorganized. Compulsory service in the army, navy, or air force was for a period of three years. The strength of the Turkish forces in 1955 was about 850,000, and the total number that could be mobilized in time of emergency was estimated at over 2,000,000. Since 1947 the Turkish armed forces have been in the process of intensive modernization, and in the Korean War they gave a very good account of themselves. The navy and air force have been expanded, although still considered secondary in relation to the excellent ground forces. American technical and material assistance has done much to improve the Turkish armed forces. There is a modern naval base at Galcuk on the Gulf of Smyrna.

## ECONOMIC RESOURCES AND ACTIVITIES

**Agriculture.** Turkey has all the requisites for a flourishing agrarian economy. About four fifths of the population is rural. However, the country is sparsely populated and only about 20 per cent of the land is cultivated annually. The Anatolian plateau is suitable for grazing purposes and supports extensive livestock. Agriculture is the most vital element in the country's economic life, though before the advent of the republic the country was backward in development of this field. The soil in most areas of Turkey is not very productive, and most of the peasants are extremely poor; more than half of the peasants owned no land in 1937, although from 1930 to 1937, 320,000 acres of land were distributed, mainly to those who returned from various Balkan countries to take up residence again in Turkey.

Grain production has increased to the point where Turkey is exporting it. In addition to cereals, mostly barley, important products are tobacco, figs, olives, opium, silk cocoons, and cotton. Turkey produces wool and woolen goods. Bursa, near İstanbul, is famous for production of silk. Credit facilities are extended to farmers by the Agricultural Bank and by the credit co-operatives organized by the bank. In 1949 there were nearly 600 such co-operatives, with a membership of 270,000. The Agricultural and Veterinary institutes contributed much toward improving methods of cultivation and breeding. In 1937 a 12-year irrigation project was begun, and in 1947 over 150,000 acres were being irrigated.

BLACK STAR

*Craftsmen of Eskişehir, Turkey, processing lumps of meerschaum. This soft stone is taken from deposits 40 ft. underground and cleaned, carved, and polished in the shops of numerous exporters.*

Various amelioration and reclamation projects were initiated. In 1945 the Land Reform Bill was enacted, aimed at transforming Turkey into a nation of small landholders. The bill provided for distribution among landless peasantry of state and vakif (ecclesiastical) land, as well as privately owned land in excess of 4.5 sq. km. One third of the rural population was expected to benefit from the Land Reform Bill. Expropriated lands were to be compensated. By 1952, however, much remained to be accomplished, in spite of the important progress actually achieved.

**Lumbering.** Approximately 10 per cent of the total area of the country is covered with forests. The government has begun an intensive exploitation of old forests to meet the country's demand for lumber. In the 1920's Turkey imported lumber; in the 1930's it began to export it, mostly to Syria and Greece.

**Industry.** Industrialization has been one of the chief aims of the Turkish Republic. From 1923 to 1933 private capital was encouraged by special privileges to carry through the development of industry. However, the response was not sufficient, and in 1933 the government began a policy of state industrialization. The first Five-Year Industrialization Plan (1934) was designed to establish the basic steel, copper, and chemical industries, to exploit the country's mineral resources, and to increase the production of consumers' goods such as textiles, porcelain, and paper. The greatest advance under this plan was made by the textile industry, the number of spindles having increased from 94,000 in 1932 to 237,000 in 1937. A new plan was adopted to build ports at Zonguldak and Trabzon, to increase mineral production, and to build a merchant marine. The two paper mills at İzmir (Smyrna) produce paper to meet a part of the domestic need. The steel works at Karabük, built by British engineers, supply some of Turkey's needed steel. In 1937 a Three-Year Industrialization Plan and in 1938 a Four-Year Industrialization Plan were set up. This planning had to be postponed because of World War II, but industrialization was not stopped altogether and Turkey in a short time developed quite a number of industries, whose output nearly doubled between 1936 and 1947. In 1949 the state controlled 75 per cent of the country's manufacture. Most of the smaller enterprises, however, remained in private hands, and since 1951 shipping has been returned to private ownership. A Ten-Year Plan for coal and lignite, a Five-Year Plan for steel and iron, as well as other plans, were produced during and after the war. However, Turkey remains dependent on imports of industrial goods. The principal industrial products are cement, cotton, and woolen yarns, textiles, rugs, carpets, paper, glass, and ceramics.

**Commerce.** Due to its efforts at industrialization, Turkey imports great amounts of machinery, iron, and steel, in addition to petroleum products and woolens, and thus has an adverse trade balance. This balance had dropped, however, to $20,000,000 by 1954. Turkey's imports come primarily from the United States, Great Britain, Italy, Germany, and France. Its leading exports are tobacco, cotton, filberts, cereals, raisins, and fruit, and they go mainly to the United States, Great Britain, Italy, Egypt, Belgium, and Switzerland. Turkey is the leading exporter of olive oil and has a monopoly on meerschaum.

**Banking.** The principal banking establishment is the Central Bank (Merkez Bank), which issues notes and controls exchange operations. The Sümer Bank is in charge of nationalized industries (cotton, wood, steel). The Eti Bank manages mineral production. The Agricultural Bank handles agricultural work.

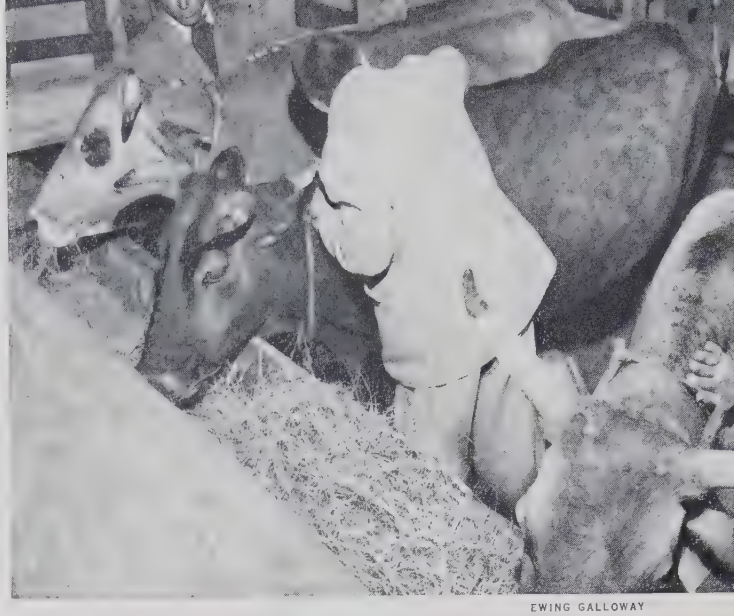
**Transportation.** Good highways in Turkey have reached the 30,000-mile mark; most of these roads have been constructed since 1948, through a contract between the Ministry of Public Works and the United States mission set up for that purpose. Railroad mileage has reached 5,000, all state-owned. Railroads linking the Turkish to the Iranian and Iraqi systems are under construction, as are railways to the ports of Mudanya and Antalya, and a new trunk line across Anatolia from east to west is planned. The state airline was founded in 1933.

**Labor Conditions.** An effort is being made to train technicians and engineers in order to improve the quality of the working force. The Labor Code adopted in 1936 prohibits strikes or lockouts. It is estimated that 850,000 men, nearly 5 per cent of the population, are under arms, and this is a serious impediment to production in a country with an ever-present labor shortage. The Ministry of Labor was created in June 1945. In January 1947 a Labor Council, representing employers, employees, and the government, was organized. In the spring of 1947 a bill was passed allowing the formation of employees' associations and labor unions. As the country is predominantly agrarian and factories are for the most part state owned, the labor movement has not acquired great importance.

## SOCIAL AND CULTURAL ACTIVITIES

**Reforms.** The greatest achievement of the republican regime in Turkey is in the field of cultural and social reforms. Through these reforms, Turkey has been regenerated to such an extent that there is little similarity between the modern nation and that of the period before World War I. The educational program is based on the principles that education should conform with the interests of the republic; that the school room should be closed to any religious influence; that education should be democratic, i.e., that every child, regardless of social status, should have equal access to educational facilities; that the school should be state supported and state managed; and, finally, that the schools should be co-educational. Among other important reforms promulgated by the republican regime are: abolition of the fez and turban for men and the veil for women; abolition of the salaam and old forms of greeting; substitution of the Roman alphabet for the Arabic script; giving women the right to vote and equality with men; abolition of polygamy; adoption of the European calendar; abolition of the Shari'a law and adoption of the Swiss civil code and the Italian penal code; and modification of the German commercial code. In general, all that belonged to the old empire has been swept away in favor of Western ideas and practices.

**Education.** Great progress has been made in education under republican rule. The schools are mostly co-educational. Most schools are state owned. The so-called village institutes, which admit graduates of the village primary schools and teach them in an atmosphere of village life, have been established throughout the country. A higher village institute has been opened at Hasanoglan, near Ankara. Turkey has about 17,500 primary and 500 secondary schools, with about 42,000 teachers and not quite 2,000,000 pupils; about 100 lycées, with about 2,000 teachers and some 30,000 pupils; about a dozen normal schools and two dozen village institutes; over 300 professional schools, with about 4,000 teachers and 40,000 students; and 33 institutions of higher learning, with some 2,000 teachers and more than 25,000 students. The last category includes four schools of university level: the University of İstanbul, the Technical University of İstanbul, the School of Political Sciences, and the University of Ankara. Other important schools are the Institute of Education of İstanbul, the Gazi Institute of Education of Ankara, and a similar school in Balikesir. The American schools, Robert College and American College for Girls, both in İstanbul, play an important role in educating young Turks. Adult education is carried out by the *Halkevleri,* the People's Houses, run by the Republican People's Party. Among other institutions are the Academy of Fine Arts, the Economic-Commercial School, the Maritime Commercial School, and the Engineering School, all in İstanbul. Illiteracy was still about 70 per cent in 1955, but prevailed chiefly among adults; the younger generation is almost entirely literate.



EWING GALLOWAY

*Turkish schoolboys gaining practical experience in animal husbandry at the Hasanoglan Village Institute near Ankara*

**Cultural Development.** One of the results of reforms under the republican regime in Turkey has been the liberalization of cultural outlook. The visual arts were severely handicapped during the empire, since the Mohammedan religion forbade the portrayal of the human figure or even animals. They have developed at a slow pace since the republic was established. The Ottoman Empire gained fame for its handicrafts, particularly carpets, jewelry, and metalwork. Ottoman architecture was highly developed.

**Historical Monuments.** The Turkish government places great emphasis upon the past glories of Anatolia, and almost every small town has a museum for which its director is charged with gathering everything of importance. The

*Tobacco leaves being cured by the sun at Samsun, a tobacco-raising center and port on the Black Sea*

EWING GALLOWAY

Ankara Archaeological Museum is the central museum of Turkey and has a fine collection of prehistoric and Hittite antiquities. The Museum of Turkish and Islamic Art in İstanbul has an extensive collection of Turkish rugs and manuscripts. Also in İstanbul is the Hagia Sophia Museum in the Byzantine basilica, built by Justinian in 537. This museum has a collection of Byzantine and Ottoman antiquities. Archaeology is greatly encouraged by the Turkish Republic, and many important remains have been discovered.

## HISTORY

**Early Ottoman Empire.** In the beginning of the seventh century the Turks had expanded over the steppes of Central Asia, ruling an empire extending from Mongolia to the Black Sea. There is much that remains uncertain regarding their racial origin and their relationship with such peoples as the Huns and Avars. A nomadic people, they spoke a language in many ways akin to Mongol, and they came to adopt Islam. Between the ninth and the eleventh centuries the Turks expanded into present-day Iraq and into Syria and Asia Minor, some of them going farther east. The Abbasid Caliphate of Baghdad became a mere enclave of Turkish power. The Seljuk Turks, taking their name from their leader, pressed against the Byzantine Empire, and in 1071 at Manzikert, in the mountains of Armenia, they won a crushing victory over the Byzantine forces. The Turks were led by Alp Arslan, great-grandson of Seljuk, and chose to remain in Asia Minor, where they established the Sultanate of Rum. The Sultanate disintegrated toward the end of the eleventh century into a number of rival emirates, military organizations deriving their livelihood chiefly from booty. These emirates were so disunited that they were unable to take advantage of the situation in the Byzantine Empire in 1204 when the Christian forces of the Fourth Crusade captured and sacked Constantinople.

The Seljuks had to fight for their very existence during the middle of the thirteenth century when the hordes of the Mongol Genghis Khan flooded Anatolia. They were saved only by the sudden collapse of the ephemeral Mongol Empire. A Turkish chieftain, Ertogrul, had particularly distinguished himself in the battles with the Mongols. Meanwhile, the emirate of his son, Osman (1299-1326), had emerged as the most powerful, becoming the nucleus around which the Ottoman Empire developed. As a result of Osman's popularity, his followers took the name Osmanli, hence Othman, or Ottoman, the followers of Osman. He was the founder of the Osman Dynasty, which ruled the Ottoman Empire until 1923, when, after the abdication of Mohammed VI (1918-1922), the thirty-ninth of this dynasty, the Turkish Republic was founded. Whether the Osmanli Turks were a fresh Turkish tribe from Central Asia or descendants of the Seljuks remains controversial. In 1326 Osman's forces captured Brusa, where Orkhan (1326-1359), his son and successor, set up the seat of the empire. Orkhan's greatest single accomplishment was the development of a strong and well-organized force, dividing it into feudal and standing branches. Nicaea and Nicomedia, the important Byzantine commercial centers, were captured in 1329 and 1338, respectively, and in 1354 Orkhan had established a foothold on the Dardanelles, paving the way for the Turkish penetration of the Balkans.

Orkhan was succeeded by Murad I (1359-1389), who conquered Thrace and transferred the Ottoman capital to Adrianople. Having occupied parts of Bulgaria and Macedonia, Murad crushed the Serbs on the Maritsa River in 1371, and at the battle of Kosovo Polje in 1389, where he and the Serbian leader, Lazar, lost their lives in the bloody battle. Murad had devised a policy of incorporation and assimilation of the Christians into the Ottoman society through the famous *devchurme,* by which certain numbers of Christian boys were delivered at designated periods to the Ottoman authorities and converted to Islam. They were tutored as civil and military leaders, and filled the ranks of the standing infantry, the so-called Janizaries (Turkish *Yenicheri*). The Janizaries were the personal slaves of the sultan, his bodyguard, and at the beginning they were not permitted to marry. Originally, their number was limited to 20,000, but this was increased rapidly, and during the reign of Suleiman the Magnificent the Janizaries gained the right to marry. Their power became so great that they enthroned and dethroned sultans at will and instigated revolutions. In this way by enlisting Christians into the service of the Ottoman Empire the Turks were able to assure the permanent domination of a handful of Moslem invaders over a vast non-Moslem population.

Murad was succeeded by Bajazet I (1389-1403), who defeated King Sigismund of Hungary at Nicopolis in 1396 and then conquered Asia Minor. Just as it appeared that the Ottoman Empire had become a reality, a great catastrophe befell Bajazet. A Mongolian raider, Timur the Lame, or Tamerlane, destroyed the army of Bajazet at Angora in 1402 and took Bajazet prisoner. The conquered peoples were too weak to throw off the Turkish rule and the Ottoman state survived, despite the civil war among the sons of Bajazet. Meanwhile, Tamerlane withdrew from Anatolia.

Mohammed I (1413-1421), known as "the Gentleman," was a man devoted to learning but he was not a political and military leader. It was Murad II (1421-1451) who completed the subjection of the Balkan peoples. He fought with the Byzantine Empire, the Serbs, Albania, Walachia, Hungary, and even the emirs of Asia Minor. In 1430, he captured Thessaloníki (Salonika), and then subjected to his rule the Greek princes in Morea. However, in 1443, after repeated defeat by the Hungarian János Hunyadi, Murad was forced to make peace with the Hungarians. The war reopened in 1444 and Murad defeated the Hungarians at Varna.

Mohammed II (1451-1481), with an army of 150,000 men and one hundred ships, captured Constantinople on May 29, 1453, overthrowing the last bit of the Byzantine Empire and the last Roman emperor, Constantine XI Palaeologus. By the capture of Constantinople, the Turks came under the direct and very effective influence of the Byzantine tradition. From this point an amalgamated Byzantine-Turkish civilization was carried to almost every corner of the Balkans. The Turks accepted the principles of state organization as crystallized by the Byzantine emperors.

**Zenith of Empire.** By the beginning of the fifteenth century the Ottomans had captured the last of Bulgaria and by the sixteenth century they had taken the last remnants of Serbia, dispersed the petty Greek rulers and captured Bosnia, Albania, and Hercegovina. They also had defeated Venice during a six-year war from 1463 to 1469, subjugated Moldavia in 1512, crushed the Magyars in 1526, and besieged Vienna in 1529. Bajazet II (1481-1512) on the whole pursued a peaceful policy and for this reason was overthrown by the Janizaries. Selim I (1512-1520), called "the Savage," destroyed the reborn emirates in Asia Minor, defeated the Persians in 1516, and the Mamelukes of Egypt in 1517. In Egypt he found the last Abbasid Caliph, who, under circumstances not too clear, transferred the Caliphate to the Ottoman Sultan. From this time until 1922 the Ottoman sultan was also caliph, or religious head, of all Moslems. The conquests of Selim led to problems of administration and to the growth of militarism and Moslem religious fanaticism.

The peak of the Ottoman Empire was reached during the reign of Sultan Suleiman the Magnificent (1520-1566), also called "the Law Giver." He captured the island of Rhodes in 1522, took Belgrade, won a victory over the Persians, defeated the Magyars at Mohács in 1526, and laid siege to Vienna in 1529. He fought with Austria over Hungary, which he incorporated into the Ottoman Empire in 1541, and engaged in pirate warfare with Spain for control of the Mediterranean. France, in the middle of the sixteenth century, became an Ottoman ally and acquired special trading privileges in the so-called Capitulations of 1535. During a three-year war from 1537 to 1540, the Ottomans again defeated Venice. The Ottoman Empire during this period was at its height, ruling over a vast territory including Mesopotamia, Arabia, and Syria in Asia; Egypt, Tunis, Libya, and Algeria in Africa; and the Balkan Peninsula and the Crimea in Europe. The government was shared by two institutions: the Ruling Institution, comprised of neo-Moslems, in charge of political and military functions of the state; and the Moslem Institution, comprised of born Moslems, in charge of spiritual, educational, and judicial functions.

**Decline of Empire.** After Suleiman's death the beginning of decay set in. Selim II, "the Sot" (1566-1574), was an extremely weak ruler. The Allied Christian fleet, including forces of the Pope, Spain, and Venice, defeated the Ottoman fleet at Lepanto on Oct. 7, 1571, marking the first major defeat of the Turks. The disunity among the Christians, however, temporarily saved the Ottoman Empire. The period after Suleiman was one characterized as that of the "passive sultans." There was a growing influence of the serai, grand viziers and ministers being appointed and dismissed under the harem influence. The sale of offices and heavy taxation contributed to political and economic instability. The power of the Janizaries increased; they controlled the government and the sultans. In 1617, a succession law was passed whereby not the son but the eldest male relative of the sultan was to succeed to the throne. During the rule of Selim II clashes on all frontiers of the empire continued. The Ruling and Moslem institutions began to break down, each usurping the other's functions.

The rules of Murad III (1574-1595), Mohammed III (1595-1603), Ahmed I (1603-1617), Mustafa I (1617-1618; 1622-1623), and Osman II (1618-1622) hastened decay and increased chaos. Murad IV (1623-1640) showed a sign of strength when he defeated the Persians and won very favorable booty, but he died on his twenty-eighth birthday. The empire continued to decay under Ibrahim (1640-1648).

The seventeenth century, meanwhile, brought great changes in Europe. Both Spain and Venice were in decline. Although by the Peace of Sitvatorok in 1606 Austria was freed from paying tribute to the Ottoman Empire, the Thirty Years' War from 1618 to 1648 seriously weakened that country. There were also important changes in the Ottoman Empire, among them the rise to prominence of the Kiuprili grand viziers, who attempted to reform the decaying Ottoman state. Mohammed Kiuprili (1656-1661), appointed vizier by Mohammed IV (1648-1687), sought to end the corruption by the use of terror, and some say that 50,000 persons met death as a result. But the wholesale executions failed to curb the influence of the harem and restore the past glory of the empire. Kiuprili resumed the policy of war, which was continued by his son Ahmed (1661-1676), who declared war on Austria, only to be defeated at St. Gotthard in 1664. In 1669, however, he captured Crete, and in 1676, through a war with Poland, he obtained Podolia. Grand Vizier Kara Mustafa (1676-1683) renewed the war with Austria and advanced to Vienna in 1683, but was defeated there by the Polish and allied forces of Jan Sobieski. By order of the

GROWTH OF THE TURKISH EMPIRE FROM 1413 TO 1566, WHEN IT REACHED ITS GREATEST EXTENT

## RULERS OF TURKEY (FORMERLY OTTOMAN EMPIRE)

| Dates of Rule | | Name of Ruler | Succession | Born | Died |
|---|---|---|---|---|---|
| | | | HOUSE OF OSMAN (OTHMAN) | | |
| 1299 | 1326 | Osman (Othman) I al-Ghazi (the Conqueror) | Son of Ertogrul; founder of the Ottoman Empire | 1259 | 1326 |
| 1326 | 1359 | Orkhan (Orkan) | Son of Osman | 1279 | 1359 |
| 1359 | 1389 | Murad I (Amurath, Mourad) | Son of Orkhan; killed in battle | 1319 | 1389 |
| 1389 | 1403 | Bajazet (Bayazid) I Vilderim (the Lightning) | Eldest son of Murad; died in captivity | 1347 | 1403 |
| 1403 | 1411 | Suleiman (Solyman) | Son of Bajazet I; killed by brother Musa | ? | 1411 |
| 1411 | 1413 | Musa (Moussa, Mousa) | Son of Bajazet I; killed by Mohammed I | c.1376 | 1413 |
| 1413 | 1421 | Mohammed I (Mahomet) | Son of Bajazet I | 1387 | 1421 |
| 1421 | 1451 | Murad II (Amurath, Mourad) | Son of Mohammed I | c.1404 | 1451 |
| 1451 | 1481 | Mohammed II (Mahomet) (the Conqueror) | Son of Murad II | 1430 | 1481 |
| 1481 | 1512 | Bajazet II | Son of Mohammed II; abdicated; assassinated | 1447 | 1512 |
| 1512 | 1520 | Selim I, the Savage | Younger son of Bajazet II | c.1466 | 1520 |
| 1520 | 1566 | Suleiman I (Solyman) (the Magnificent) | Son of Selim I; sometimes known as Suleiman II | 1495 | 1566 |
| 1566 | 1574 | Selim II, the Sot | Son of Suleiman I | c.1524 | 1574 |
| 1574 | 1595 | Murad III (Amurath, Mourad) | Son of Selim II | 1546 | 1595 |
| 1595 | 1603 | Mohammed III (Mahomet) | Son of Murad III | 1566 | 1603 |
| 1603 | 1617 | Ahmed I (Achmet) | Son of Mohammed III | 1589 | 1617 |
| 1617 | 1618 | Mustafa I | Son of Mohammed III; displaced | 1591 | 1639 |
| 1618 | 1622 | Osman II (Othman) | Son of Ahmed I; raised to throne by Janizaries, then strangled by them | 1604 | 1622 |
| 1622 | 1623 | Mustafa I (restored) | Son of Mohammed III; deposed; strangled | 1591 | 1639 |
| 1623 | 1640 | Murad IV (Amurath, Mourad) | Son of Ahmed I | 1609 | 1640 |
| 1640 | 1648 | Ibrahim | Youngest son of Ahmed I; deposed, and killed by son and Janizaries | 1615 | 1648 |
| 1648 | 1687 | Mohammed IV (Mahomet) | Son of Ibrahim; grandmother Kensem and vizier regents | 1641 | 1691 |
| 1687 | 1691 | Suleiman II (Soliman) | Son of Ibrahim; set aside as incompetent | 1642 | 1691 |
| 1691 | 1695 | Ahmed II | Son of Ibrahim | 1643 | 1695 |
| 1695 | 1703 | Mustafa II | Son of Mohammed IV; abdication forced by Janizaries | 1664 | 1703 |
| 1703 | 1730 | Ahmed III | Son of Mohammed IV; deposed 1730 | 1673 | 1736 |
| 1730 | 1754 | Mahmud I (Mahmond) | Son of Mustafa II; placed on throne by Janizaries | 1696 | 1754 |
| 1754 | 1757 | Osman (Othman) III | Son of Mustafa II | 1692 | 1757 |
| 1757 | 1774 | Mustafa III | Son of Ahmed III | 1717 | 1774 |
| 1774 | 1789 | Abdul-Hamid I | Son of Ahmed III | 1725 | 1789 |
| 1789 | 1807 | Selim III | Son of Mustafa III; deposed and imprisoned in 1807; killed after restoration | 1761 | 1808 |
| 1807 | 1808 | Mustafa IV | Son of Abdul-Hamid I; put on throne by Janizaries; dethroned by them in 1808 | 1779 | 1808 |
| 1808 | 1839 | Mahmud II | Son of Abdul-Hamid I | 1785 | 1839 |
| 1839 | 1861 | Abdul-Medjid I | Son of Mahmud II | 1823 | 1861 |
| 1861 | 1876 | Abdul-Aziz | Second son of Mahmud II; dethroned; assassinated or a suicide | 1830 | 1876 |
| 1876 | 1876 | Murad V | Eldest son of Abdul-Medjid I; deposed; insane | 1840 | 1904 |
| 1876 | 1909 | Abdul-Hamid II, the Red | Second son of Abdul-Medjid I; deposed | 1842 | 1918 |
| 1909 | 1918 | Mohammed V (Mehmed) | Son of Abdul-Medjid I | 1844 | 1918 |
| 1918 | 1922 | Mohammed VI | Son of Abdul-Medjid I; last sultan of Ottoman Empire; abdicated | 1861 | 1926 |
| | | | GOVERNMENT OF THE GRAND NATIONAL ASSEMBLY OF TURKEY | | |
| 1920 | 1923 | Kemal Atatürk (Kemal Pasha) | Elected president of provisional government set up in opposition to Constantinople government controlled by Allies | 1880 | 1938 |
| | | | REPUBLIC OF TURKEY | | |
| 1923 | 1938 | Kemal Atatürk (Kemal Pasha) | Elected President; re-elected 1927, 1935 | 1880 | 1938 |
| 1938 | 1950 | Gen. İsmet İnönü | Elected President; formerly Premier, re-elected 1943 and 1946 | 1884 | |
| 1950 | | Celâl Bayar | Elected President; leader of Democratic Party; re-elected 1954 | 1884 | |

sultan, Kara Mustafa was executed. The failure marked a definite turning point in Ottoman history. The decay continued after the end of the Kiuprili reform, and in 1684 Christian Europe, represented by Austria, Poland, and Venice, for the first time united in an alliance against the Turks. From this time on the Ottoman Empire was in steady territorial recession. By the Treaty of Karlowitz in 1699, the Turks lost Hungary and Transylvania to the Hapsburgs, Podolia to Poland, and Morea to Venice. Under Peter the Great, Russia expanded at Ottoman expense to the Black Sea, and throughout the eighteenth century Austria and Russia continued aggression against the Turks. In 1711 the Turks regained Azov from Russia, but in a war from 1715 to 1718 they were defeated by the Austrians to whom, by the peace at Passarowitz in 1718, they lost the Banat of Temesvár. From 1735 to 1739 the Turks defeated the combined Austro-Russian armies and won back parts of Serbia and Walachia.

The Treaty of Kuchuk Kainarji in 1774, which ended the Russo-Turkish War, 1768-1774, was a terrible blow to the Ottoman Empire. The Russians received freedom on the Black Sea and the use of the Straits; they also won a protectorate over Walachia and Moldavia and the Ottoman promise to protect the Christian religion. By the Treaty of Jassy in 1792 Russia added to its Black Sea possessions.

The decline of the empire, principally because of poor organization and corruption, was further hastened by the separatist tendencies of the oligarchs who ruled various provinces, the growing strife between the various branches of administration, the rising nationalist ideas among the subject Christian peoples, the inability of the government to ameliorate the social conditions caused by the disintegration of the feudal regime, and the system of "capitulations" giving foreign traders freedom from Turkish laws and taxation.

In 1798 Napoleon landed in Egypt. In 1804 the Serbs

under their leader Karageorge raised a revolution, leading to two disastrous wars with the Turks in 1806-1807 and 1809-1812; by the Treaty of Bucharest (1812) the Turks were compelled to grant the Serbs partial autonomy. In 1815 the Serbs started another rebellion under Miloš Obrenović and in 1821 began the Greek War of Independence. Another war with Russia (1828) ended in the disastrous Treaty of Adrianople (1829), which gave further commercial rights to Russia, allowed Russian occupation of Moldavia and Wallachia, and recognized Greek independence. A struggle with the beys and insubordinate pashas added to the turmoil. Pasvanoglu of Vidin and Ali Pasha of Janina sought to carve out states within the Empire. Mohammed Ali, Pasha of Egypt, even marched toward Asia Minor. Russian intervention on the behalf of the Sultan spared the Empire, but only at the cost of the Treaty of Unkiar Skelessi (1833), which assured the Russians of a dominant position in the Straits. With the assistance of Western Powers, Mohammed Ali was subordinated in 1839-1840.

France had established itself in Algiers in 1830, and Great Britain was gradually extending its control over the southern parts of Arabia. The Ottomans found themselves victorious in the Crimean War, but the Treaty of Paris (1856) compelled them to relinquish the role of protector of Serbia. For all intents and purposes the Romanian provinces of Walachia and Moldavia were lost. And in the early 1860's there were new wars with Montenegro and uprisings in the Lebanon. In 1875 there were uprisings in the Balkans, which gradually spread. The Turks were guilty of barbarism in suppressing the rebels, and the Bulgarian massacres invoked world-wide indignation. These insurrections led to wars with Serbia and Montenegro, and in 1877-1878 with Russia. By the Treaty of San Stefano (March 1878) Great Bulgaria was established under Russian occupation; and Serbia and Montenegro were declared independent and enlarged. European intervention brought about the Treaty of Berlin (June 1878), which reduced Bulgaria, restored certain lands to Turkey, but recognized the independence of Serbia, Romania, and Montenegro. After 1878 German influence grew rapidly in Istanbul, and the Germans negotiated various economic arrangements, including the Berlin-Baghdad railroad. Disraeli acquired a lease to Cyprus on June 4, 1878, and in 1882 England occupied Egypt. From 1894-1896 a series of Armenian massacres caused European indignation. In 1897 the German-trained Turkish army defeated the Greeks in a short war. From 1903 on there were serious disturbances in Macedonia, which required European intervention and led to abortive efforts to reform Turkey.

**Modern History.** The history of modern Turkey begins in 1876 when Sultan Abdul-Hamid II (1876-1909) granted his empire a constitution. Although this constitution was annulled in the following year, the liberal ideas which had penetrated the Ottoman Empire from the West, and which were supported in Turkey by the Young Turks, retained their strength. The "Young Ottomans," as they were first called, appeared during the reign of Abdul-Hamid II, and organized a Committee of Union and Progress which was widely supported by army officers. Their purpose was to dethrone the sultan and institute reforms. This aim was realized after a year of struggle from 1908 to 1909, when Sultan Abdul-Hamid II was dethroned and a government under the leadership of the Young Turks was established. However, there was little change in the imperial system, and conditions deteriorated when the Young Turks embarked on a policy of Turkification. This policy alienated those who supported the Young Turks. Albanians were no longer content with only autonomy and wanted full independence. Arabs likewise intensified nationalist activity and organized secret societies aimed at destruction of the Empire. In October 1908 Bosnia-Hercegovina, which had been occupied by Austria-Hungary in 1878, was annexed. Bulgaria took the occasion to declare itself entirely independent. In 1911 Italy defeated Turkey and acquired Libya and the Dodecanese. In 1912, the joint Serbian, Bulgarian, Greek, and Montenegrin forces declared war on the Ottoman Empire. As a result of the two Balkan Wars, 1912-1913, Turkey lost all its possessions in Europe except Eastern Thrace.

The financial structure of the Ottoman regime during this period became very precarious, and Germany came forward with a favorable offer of assistance. Following this loan, a secret alliance was formed which brought Turkey into World War I on the side of the Central Powers. Turkey was decisively defeated, and in 1920, under the Treaty of Sèvres, the Ottoman Empire was broken up. Turkey, confined to

*NATION SQUARE, ANKARA*

COURTESY OF THE TURKISH EMBASSY

Asia Minor and to the neighborhood of Constantinople in Europe, seemed about to become a colony of the European power. It was rescued from this by Kemal Atatürk. After Mohammed VI, the sultan, capitulated at Sèvres, Atatürk decided to organize resistance to the terms of the peace treaty as far from Constantinople as possible. His arrival at Samsun on May 19, 1919, is a date honored by the Turks as the beginning of the Turkish National Revolution. At this time the Greeks were occupying Smyrna, and, against overwhelming odds, Atatürk organized an army to drive them out. His success in defeating the Greeks won for Turkey a negotiated settlement at the Lausanne Conference in 1923. By this settlement Turkey reacquired that portion of Thrace which lies east of the Maritsa River.

On Oct. 29, 1923, Turkey was proclaimed a republic and Kemal Atatürk was unanimously elected its president. Atatürk was determined to make of Turkey a modern state on western lines. His Republican People's Party became the only legal party, and his adversaries were one by one ruthlessly crushed. By the time of his death in 1938, great progress had been made in the westernization and industrialization of the country. Atatürk was succeeded in the office of president by former Premier İsmet İnönü, first elected in 1938 and re-elected in 1943 and 1946.

**Recent Developments.** Turkey remained neutral during most of World War II and broke off diplomatic relations with Germany in August 1944, and with Japan in January 1945. The rupture of the Turkish-German relations followed the compliance of the Turkish government with the joint request of the United States and British governments in April 1944 to stop the country's entire export of chrome and other materials to Germany. Turkey entered the war on Feb. 23, 1945, after the Yalta Conference, in order to be permitted to attend the United Nations Conference on International Organization in April 1945.

In 1936, the Conference at Montreux had given Turkey permission to fortify and control the Straits of the Dardanelles. The Soviet Union after World War II charged that Turkey had not fulfilled its responsibility of keeping German ships from entering the Black Sea and demanded revisions of the Montreux Convention. At the beginning of 1945, the Soviet Union renounced the Soviet-Turkish treaty of friendship, which was to have expired on Dec. 7, 1945. Although the United States and Great Britain were not unfavorably disposed to the revision of the convention, they opposed the Soviet demand that it share with Turkey the military defense of the Straits. The situation grew tense when the Soviet Union demanded, among other things, Kars and Ardahan in eastern Turkey, which had once been Russian.

On Mar. 12, 1947, President Truman sent a message to Congress requesting loans to support the governments of Greece and Turkey. In the case of Turkey, the full amount of $100,000,000 was earmarked for the modernization of the Turkish army. It was estimated that 44 per cent of the Turkish budget would be spent for military purposes. This, together with other burdens placed upon the Turkish economy by the military establishment, had given rise in 1947 to fears that the strain would soon become too great for Turkey to maintain economic stability. However, the American loan ended the war of nerves with the Soviet Union. President İnönü used the credits extended to Turkey by the International Bank of Reconstruction for the consolidation of his country's economy and for expediting the development of national industry. In 1949 Turkey joined the Advisory Council of Europe, and in September 1950 Turkey sent a brigade to join United Nations forces in the Korean War.

The election of May 22, 1950, gave a surprising victory to the newly created Democratic Party, whose principal leaders had once been prominent members of the Republican People's Party. This officially inaugurated the two-party form of government. Celâl Bayar was elected president, Adnan Menderes became Prime Minister, and Fuad Köprülü ( a descendant of the ancient Kiuprili family) Foreign Minister. Sweeping reforms were announced, tending to depart from the former rigid statism and allowing more place to private initiative. Concessions were made to religion and to religious education. Industrialization of the country continued and additional distribution of land was envisaged. The foreign policy remained unaltered.

Serious dollar and sterling shortages reduced the Turkish foreign trade potential, but credit and loans from the International Bank for Reconstruction and Development and from the European Recovery Program were extended. In the general elections of 1954 Celâl Bayar and his Democratic Party were returned to office with overwhelming majorities.

In international affairs, the most important events were the signing, in 1954, of a twenty-year military pact with Yugoslavia and Greece, each promising military aid against unprovoked aggression, and in the same year, a mutual security pact with Pakistan, which was extended the next year to include Iraq. The membership of other Arab states of the Middle East in this latter pact was solicited, causing considerable debate and some opposition within the Arab League, but Egypt's efforts to have the League reprimand Iraq was rejected by the other member states. These agreements and Turkey's membership in NATO were strategic diplomatic victories for the Western powers in the Cold War. *See also* Mohammedan Architecture; Mohammedan Art; Turkish Literature; Turkish Music. **TURKEY,** a large bird of the class Aves in the genus *Meleagris,* and in the species *gallopavo.* It is indigenous to the continents of the Western Hemisphere, and, becoming readily adapted to domestication, furnishes a palatable and nutritious meat supply for human consumption. The breeding and rearing of domesticated varieties of turkeys is an economically significant part of the American poultry industry. The turkey employed in the commercial enterprise is the descendant of the North American wild turkey, of the family Meleagrididae, within the order Galliformes, in the subclass Neornithes. Turkeys were first seen by white men soon after 1492, at which time they probably had been used by the American Indians as a source of meat food for many generations. At least five subspecies of wild turkeys have been recognized, ranging in original habitat from Mexico to northern New England. Wild turkeys, although considerably reduced in numbers, are still to be found.

The American Poultry Association's (A.P.A.) Standard of Perfection, the recognized poultry-breed standard, lists and gives standards of quality for the Bronze, Narragansett, White Holland, Bourbon Red, Black, and Slate. More or less widely known also are such nonstandard varieties as the Jersey Buff, Nittany, Beltsville Small White, Broad-breasted, Crimson Dawn, Blue, and the Royal Palm. Certain varieties of turkey seem especially well adapted to conditions prevailing in certain areas, so that growers have a wide choice.

The American turkey industry, according to United States Department of Agriculture estimates, grew steadily from an approximate 15,000,000 turkeys raised per year in 1924 to over 44,000,000, weighing 541,000,000 lb., in 1944—4.3 lb. per capita against 28.9 lb. for chickens. In the record year

1946, the consumption was 687,000,000 lb. In 1948, as a result of the abandonment of meat rationing and the general availability of other foods and most consumers' goods, turkey consumption was somewhat below the 1944 level. The Pacific Coast states, the great prairie states, the Mississippi Valley states, and those along the Atlantic Seaboard have developed large centers of commercial turkey production.

The turkey industry has extended beyond the United States and Canada. All turkeys that are bred for commercial purposes are descendants of *Meleagris gallopavo.* There is another genus in the family Meleagrididae, known as *Agriocharis ocellata,* or ocellated (eyelike-spotted) turkey. This native of the Yucatan peninsula of Mexico and adjoining territory remains a creature of the dense forest. A golden turkey has been reported in Peru. W. C. T.

**TURKEY BEARD,** a group, *Xerophyllum,* of tall, stately perennials of the lily family, composed of three species all native to North America. Their strong stems, springing from short, thick rootstocks, are unbranched, very leafy at the base, and bear handsome spikes of innumerable small, fragrant, white flowers. The eastern turkey beard, *X. asphodeloides,* rises to 5 ft., having a thick tuft of very narrow leaves. Its flower cluster is a loose oval, 6 in. long. Native to dry pine barrens from New Jersey to Florida and Tennessee, it is often planted in wild gardens, especially in England. Western turkey beard, *X. tenax,* called also bear grass and squaw grass, often reaches a height of 6 ft. The flowers are creamy white and have violet stamens, and hundreds are crowded on spikes sometimes 1½ ft. long, of solid, yet feathery, appearance. The plant blooms with striking effect on dry mountain slopes from Yellowstone Park to British Columbia, and southward into California. The leaf fibers were formerly used by the Indians in making fine baskets; the roots were roasted for food. J. C. Wis.

**TURKEY VULTURE,** a New World vulture, *Cathartes aura,* occurring in a number of closely related forms from southeastern and southwestern Canada to the Strait of Magellan and the Falkland Islands. It is a large bird (length, 2½ ft.; wing spread, 6 ft.). The plumage is brownish black, except for the silvery underside of the wings and the naked skin of the head and bright red neck. Entirely a carrion feeder, it is protected by law in many areas because of its services as a scavenger. The belief that it is a distributor of disease has been disproved by experiment. A popular name for it is turkey buzzard. H. G. De.

**TURKIC LANGUAGES.** *See* ALTAIC LANGUAGES.

**TURKISH,** more exactly Osmanli or Ottoman Turkish, a language spoken by about 20,000,000 persons, mostly of Turkic stock, and mainly in Turkey and along the Black Sea coast of Bulgaria, but also by minorities in Yugoslavia, Albania, Iraq, and Cyprus. Together with Azerbaidzhanian and Turkoman, Osmanli forms the Southwest or "Orghus" group of Turkic languages, which is a branch of the Altaic family.

The oldest Turkish inscriptions, dating from A.D. 734 or 735, were found near the Orkhon River, south of Lake Baikal in central Asia. A Turkish-Arabic Dictionary was compiled by Mahmud al-Kashgari about 1074, and the Codex Cumanicus of 1303 contains Latin-Persian-Turkish, Turkish-Latin, and Turkish-German glossaries, using a Latin transcription for Turkish. The very old texts are written in a Semitic script of unknown origin, but practically all historical texts are written in the Perso-Arab script that was officially used until 1928. This script was by no means an ideal medium to express the sounds of Turkish, and its shortcomings helped to discourage literacy. To remedy the situation, the first Turkish Language Congress under Kemal Atatürk adopted Latin characters as the official Turkish script but considerably modified the Latin alphabet. The letters *q* and *w* are omitted but the umlauts *ö* and *ü* are used. The symbol *ş* was introduced for the sound of *sh* in *shine, c* was given the value of *j* in *John,* and *ç* was introduced for the sound of *ch* in *church.* Depending on its etymological origin, *ğ* may indicate either a vocal glide, articulated like the *y* in *voyage,* or it may stand for a guttural, as in *dağ,* "mountain"; in the latter case, however, it has dwindled to a mere glottal stop in the dialect of İstanbul. The symbol *ı* (an *i* without a dot, or with a small circle in its place) is used for a full vowel, which may be described as being between *i, e,* and *ö.*

COURTESY OF THE NEW JERSEY AGRICULTURAL EXPERIMENT STATION

*A flock of Monmouth Bronze turkeys on a New Jersey turkey farm*

Encouraged by the enthusiasm that followed the introduction of Latin script and the ensuing spread of literacy, the language congresses of 1932 and 1934, under Kemalist dictatorship and at the height of nationalistic feeling, set out "to put the Turkish language into a form that could be easily learned and understood by everybody" and to bridge the gap between the "fine" dialect of İstanbul and the "rude" *kaba* dialect of the peasants. In 1932 the official Turkish Language Society, *Türk Dil Cemiyeti,* was formed. While some of the Western constructions in grammer were adopted to make the language a better tool for all sciences, the emphasis was on vocabulary. Just before the 1934 congress, the *Tarama Dergisi* dictionary, with an Ottoman Neo-Turkish and a Neo-Turkish Ottoman volume, was published. Persian and Arabic words, wherever possible, were replaced by *kaba* words, obsolete Turkish words, words from other Turkic dialects, or even newly coined words. In 1935 the metropolitan press tried to use the new official language exclusively, but readers found themselves obliged to use the dictionary and were offended by the use of *kaba.* Newspaper circulations soon dropped. A new pocket dictionary was less radical, and the 1936 language congress, preoccupied with proving Turkish to be the mother of all languages, resigned itself to a middle-of-the-road policy. While the extreme aim of the reform movement has not been attained, it has definitely left its imprint on the Turkish language.

**Characteristics.** Agglutination, sound harmony, and

scarcity of conjunctions are among the principal features that Turkish shares with other languages of the Southwest Turkic group.

*Agglutination.* Turkish has a wealth of suffixes for noun, pronoun, and verb inflection without any very strict line between these categories. These suffixes, each of which has only one function, may be added and combined at will without any distinction of declension or conjugation; only their sequence is fixed, and they are subject to vowel harmony. Examples are: *ev* "house," *ev-ler* "houses," *ev-im* "my house," *ev-den* "from the house," *ev-ler-im-den* "from my houses"; *sev* "he loves," *sev-ler* "they love," *sev-iş-dir-il-e-me-ler* "they cannot be made to love one another."

*Sound Harmony.* Turkish has two series of vowels, the "soft" ones *e, i, ö,* and *ü,* and the "hard" ones *a, ı* (*i*), *o,* and *u.* Suffixes, unless still felt as independent words, exist in at least two alternate forms, one with a soft vowel and one with a hard one, e.g., *ev-ler* "houses," but *adam-lar* "men." At the end of a word, before a suffix, *p, t, ç,* and *k,* under certain conditions, can be replaced respectively by *b, d, c,* and either the glide *ğ* or at times *g.*

*Scarcity of Conjunctions.* Co-ordinating conjunctions in Turkish are mostly from Arabic or Persian, and subordinating ones are almost absent. There are, however, many verbal nouns which express the meaning of subordinate clauses quite as well as clauses. There is no definite article, but since case suffixes are used only where a definite article would be used, they take its place. The numeral *bir* "one" serves increasingly for an indefinite article.

*Other Characteristics.* In addition to the principal Turkic characteristics of the language, others may be briefly noted. Gender is not distinguished, *o* standing for "he," "she," or "it." The plural in *-lar* or *-ler* is an innovation. Pronominal expressions of the first and second person still preserve the common Turkic plural ending *-z* (e.g., *ev-im-iz,* "our houses," *sev-im-iz,* "we love"). Every syllable is fully pronounced. The last syllable usually carries the main accent, the first syllable a lighter one.

The main feature that distinguishes Osmanli from other Turkic languages is the vast influence of other idioms. The educated dialect is heavily penetrated with Arabic, Persian, and French; the *kaba* dialect shows more Byzantine influence. Arabic, as the language of the Moslem religion, and the language during the Middle Ages of the arts, sciences, and learning in general, has had a profound influence. Persian was the language of poetry and fiction. When Turkey turned to the West in the nineteenth century, both were replaced by French. In the "fine" Turkish language about 50 per cent of the words used are foreign, in technical texts often 95 per cent.

Since Turkey's defeat in World War I the importance of the language outside of Turkey has been slight. P. F.

**TURKISH LITERATURE,** the literature of the Osmanli or Ottoman Turks. The product of a people who won fame by establishing a vast empire, Turkish literature is comparatively recent in origin, for its first records do not antedate the end of the thirteenth century. However, the ethnic groups of Turkic stock who remained in their original home in Central Asia were active in literary pursuits at a much earlier date.

**Turkic Precursors.** The so-called Orkhon inscriptions in inner Mongolia go back to the eighth century A.D., and only a little later are the fragmentary texts of the Turkic Uigurs, from the caves of Turfan in Chinese Turkestan. Religious in their content, these texts bear evidence of the stupendous variety of the religious influences which expanded along the "Silk Road" linking China to Persia, since Buddhism, Manichaeism, Nestorian Christianity, and Judaism are represented in them. Their script, the so-called Runic alphabet, is of Aramaic origin. However, despite the great historical importance of these scanty remnants of a well-developed culture among the Uigurs, not discovered until the beginning of the twentieth century, they do not belong to literature proper.

It was only after the Turkic peoples were converted to Islam and began to follow the pattern of Persian literature that some attempts at poetical composition were made in Transoxiana and western Turkestan; this took place not earlier than the latter half of the tenth century, chiefly in the dialect of Kashgar, the main political center of the region. The themes generally treated are ethical wisdom and mystic (Sufi) effusions, and neither originality nor style rank very high. This literature was not long-lived, for the Tatar invasion at the beginning of the thirteenth century proved fatal to its further growth. Only the speakers of another Eastern Turkic dialect, the Chagatai, carried on, under overwhelming Persian influence, a noticeable literary activity both in poetry and prose. The most remarkable fruit of this activity is the autobiography of the Mogul Sultan Baber (1483-1530), the conqueror of India.

**Beginnings of Turkish Literature.** The cultural significance as well as the political power of the Turkic peoples was carried to the West by the Osmanli, or Ottoman Turks. They were a numerically small tribe of nomadic warriors who moved from Central Asia to Asia Minor in the thirteenth century, conquered the Balkans during the fourteenth and fifteenth centuries and Syria, Mesopotamia, Egypt, and Arabia in the sixteenth, and were for about four centuries the leading Moslem state and one of the most powerful empires in world history. Their literary achievements, however, fell short of their political importance.

From the very rise of their nation, the Turks were under the spell of the Persian and Arabic traditions. The former supplied them with an artistic background and the latter with a scholarly and religious background, and between them they nearly stifled the independence and originality of the Turks' creative abilities. A substantial number of works which belong to Persian or Arabic literature, because they are written in one or the other of those languages, are actually the product of Turkish authors; some of the most famous among the sultans, including Mohammed I (1387-1421) and Suleiman the Magnificent (c. 1496-1566), composed Persian poems with uncommon skill. Nevertheless, the Turks never lost consciousness of their nationality, constantly used their language for administrative and other nonliterary purposes, and strove to make it fit for artistic expression, even though they did not achieve complete emancipation from Persian models until very recent times.

The oldest attempts at writing Turkish verse go back to the end of the thirteenth century, a collection (*divan*) of mystic poems by Yunus Emreh being considered the earliest example of a book written entirely in Turkish. Emreh tried to substitute metrics based on the count of syllables for the Arabic and Persian quantitative metrics, the latter being quite unfit for the Turkish language. He was unsuccessful, however, and his followers clung faithfully to the foreign system.

**Classical Period.** Turkish poetry reached its peak in the fifteenth and sixteenth centuries, contemporaneously with the expansion of Turkish political power. Among the most renowned poets of that period are Sheikhi (died c.1430),

Nejati (died c. 1500), Mesihi (died 1502), Baki (died c. 1600), and Nef'i (died c. 1635). Of these, the two last attained the widest popularity. Fuzuli (c.1494-c.1555), perhaps the most gifted of them all, composed his poems in Azeri, the dialect of the Persian province of Azerbaidzhan. The merits of these poets, however, like those of all Turkish literature, are purely formal; their inspiration and their contents are wholly Persian.

In addition, an extensive poetical work was written by Yaziji Oghlu Mehmet (died 1451) under the title of *Mehmediyye* ("The Poem of Mohammed"). This is an ambitious description of the world and its history, the Prophet's mission, the foundation of Islam, and the Final Judgment, but it lacks originality of thought and artistic significance. As a curiosity, mention may be made of the *Bahriyye,* a poem on nautical science written early in the sixteenth century by an expert sailor, Piri Re'is (died 1555). Added to it is a map, on which Columbus' travels to America are recorded.

Besides religious and scientific writings which hardly belong to literature proper, the Turks cultivated history extensively, chiefly in the form of annals and biographies of sultans and their ministers. Evliya Chelebi (died c. 1679) wrote a highly interesting and lively report of his travels, the *Siyahet Nameh.* The legendary epic tale, *Sayyid Battal,* originally composed in Arabic, exists also in a Turkish adaptation augmented by the addition of new elements. Most works of fiction are mere translations from the Persian.

During this extended period of subservience to foreign patterns, the native artistic impulse of the Turks found literary expression only in popular writings. In these, genuine aesthetic values were expressed in simple and immediate form, although no author of exceptional stature emerged to mold this uncouth material into a finished work of art. Freshness and spontaneity characterized a kind of popular song called *Mani,* and the jocular and satirical vein of the common people found expression in rather crude dramatic plays. The plays were of three types, known as *Meddah, Orta Oyunu,* and *Karagöz* (the last so named after its principal character, a clown), and were often accompanied by musical performances. They originated probably before the Turkish invasion of Europe and are related to the Arabic shadow theatre; what is known of them now is derived from other sources, for no actual texts of the plays have survived.

**Period of French Domination.** In the nineteenth century, as reforms began to affect the administrative, judicial, and educational policies of Turkey, Turkish literature also entered a new phase. Persian influences began to lose their domination and were gradually replaced by the influences of the Western nations, particularly the French. The leader of the new school of literature in Turkey was Shinasi (1824-1871), who in 1860 started the first Turkish newspaper, *Tercuma-i-Ahval.* He also pioneered in the domain of the drama with his satirical play *Sha'ir Evlenmesi,* the first Turkish literary comedy.

Namik Kemal (1840-1888), a disciple of Shinasi, was more effective as a political figure than as a man of letters. The writer of this period who was responsible for the greatest changes in Turkish poetry and drama, however, was Abdulhak Hamit (1851-1937), a friend and disciple of Namik Kemal. His dramatic works, written under the influence of Racine and Corneille, are unsuited for theatrical performances, but they are emotionally powerful. In the lyric, he abandoned the ancient form and its almost artificial sentimentality, turning instead to descriptive realism. Mehmed Ra'uf (died 1919), a novelist, and Jelal Sahir (1883-1935), a poet, are two of the other noteworthy writers of this period who found inspiration in such French authors as Daudet, Zola, Flaubert, Musset, and Baudelaire.

**Modern Period.** The next phase of Turkish literature, the struggle for nationalism, followed closely upon the revolution of 1908. The aims of this movement were to rid literature and language of all foreign elements and influences. In literature this signified a return to everything Turkish, in characters, settings, situations, and language, but the excesses of the movement soon passed over. The outstanding writers of this period are a woman, Halide Edib, and Yakub Kadri, both of whom depicted the turbulent history of Anatolia, presenting real characters in realistic environment and situations. Halide Edib is perhaps superior to Kadri as a story-teller, while Kadri, who shows the influence of the French novelists Maupassant, Alphonse Daudet, and Paul Bourget, excels in mastery of style. Other writers of importance are the novelist Omar Seyfettin (died 1920) and especially Ziya Gökalp (died 1924), the theoretician of Turkish nationalism and a philosopher and poet of great merit. G. L. D. V. and E. Fr.

**TURKISH MUSIC.** The music cultivated during recent years within the confines of what is now the Republic of Turkey falls into three distinct classes, which at the midpoint of the twentieth century were only beginning to fuse into a homogeneous national musical pattern. The oldest of these classes is itself a conglomeration of musical styles, each developed and sustained over many centuries by one or more of the numerous ethnic groups formed by wave after wave of military conquest, group immigration, and cultural invasion. In addition to the Greeks, Kurds, Armenians, and other foreign groups within the Turkish borders, many different Turkish subgroups contribute to the total body of Turkish folk music. Scorned by the urban, educated ruling minority in the former Ottoman Empire (c. 1300-1923), this music of the Anatolian folk has little in common with the second broad class of recent Turkish music, the *ince saz,* or "refined music," of the erstwhile Ottoman court and with the religious music of the once-great monastic centers.

In contrast to the purely oral folk traditions, the Ottoman art music boasted a highly developed theory and a considerable literature. Far from being merely local in its focus, it was heir to the once-glorious mantle of so-called "Arabic" music, to which Greeks, Turks, Iranians, and Jews as well as Arabs had contributed in medieval times, the Arabic language serving merely as a *lingua franca,* and which exerted its influence from Spain to the islands of the South Pacific. Whereas the various folk music styles show a fondness for relatively stable pentatonic and heptatonic scale formations, the Ottoman art music was based on a complex system of melodic formulas or *makamat,* derived through permutations of an underlying twenty-four-tone scale, of which, however, less than half the tones were used in any given composition. The contrast between rhythmic styles is less marked, both folk and art music displaying varieties and subtleties of a kind unknown to Western music; art music, for instance, possessed a rhythmic system, or *usul,* having about fifty standard metrical patterns as opposed to the half dozen common in European music.

The chief instruments of the Ottoman "refined music" were the expressive, age-old Turkish *tanbur,* or long-necked lute, the soft-toned vertical flute, or *ney,* and the silvery *sine keman,* or "breast fiddle," a Turkish relative of the European viola d'amore. Folk instruments, on the other hand, while including many types and many local varieties within those

types, are represented above all by the shrill, squalling *zurna,* or oboe, and the loud *davul,* a medium or large bass drum. Like unsophisticated music everywhere, Turkish folk music usually accompanies either singing or dancing, whereas the art music has found expression in purely instrumental "concert" suites and individual pieces as well as in extremely florid love and religious songs. The most characteristic form of Turkish music was the once widely-known *mehterhane* or military band, which combined elements of Central Asiatic Turkish music with Southwestern Asiatic folk traditions and Ottoman art music; paradoxically, however, this vital form was abandoned, largely because of its association with the often defeated and outmoded Turkish military organization, about 1825, in favor of the European type of military band, which the *mehterhane* had itself helped to formulate.

The third class of music found in twentieth-century Turkey is Euro-American music in all its phases. Until the final breakdown of the Ottoman Empire following its defeat in World War I, Western music was represented in Turkey almost solely by the military band; between the two world wars, however, President Kemal Atatürk's republican regime carried out a drastic program of westernization which affected music in common with other arts. The Ottoman art music was neglected and at times even banned because of its association with the decadent, outlawed aristocracy; in its place sprang up symphony orchestras, opera, and chamber music, while Western music became a part of the reformed school curriculum and American popular music appeared in the coffee houses. At the same time, Turkish scholars, with the aid of such foreign experts as Béla Bartók, began to study and to codify the hitherto neglected wealth of local folk music traditions, and native composers began to use this material as the basis of a new national music, Western in form but Turkish in substance. *See also* MILITARY MUSIC. W. Li.

**TURKMEN SOVIET SOCIALIST REPUBLIC** or **TURKMENISTAN** [tɜ′rkmɛn, tɜ′rkmɛnɪsta′n], the southernmost constituent republic of the Union of Soviet Socialist Republics. It was inhabited from the tenth century by Turki tribes, of which the Tekke or Teppe were the most important. In 1881 their stronghold of Goek Tepe was conquered and the region was incorporated into Russian Turkestan. In October 1924 it was organized into a soviet republic from the former Trans-Caspian region of Turkestan, the Chardzhou vilayet of Bukhara, and a part of Khiva on the right bank of the Amu Darya. In May 1925 it became a constituent republic of the Union of Soviet Socialist Republics. It is subdivided into the Krasnovodsk, Tashauz, Ashkhabad, Chardzhou, Mary (Merv), and Kerki regions. With an area of 171,042 sq. mi., it is bounded by the Caspian Sea on the west, Kazakh Soviet Socialist Republic on the north, Uzbek Soviet Socialist Republic on the north and northeast, Afghanistan on the southeast, and Iran on the south. The capital is Ashkhabad.

*TURKMENIAN WOMEN IN THE COTTON FIELDS OF ASHKHABAD*

SOVFOTO

SOVFOTO

*A trader and his camel train crossing the Kara Kum, a vast desert area in central Turkmen*

The driest region of the Soviet Union is the Kara Kum (Desert), which forms 85 per cent of Turkmenistan. Along the southern and eastern borders are the Kopet and Karabil mountains. The Amu Darya (the ancient Oxus River) marks part of the boundaries with Uzbek and Afghanistan; the Atrek and Hari Rud form part of the boundary with Iran; and the large Murghab River flows south into Afghanistan. Summers are long and hot, with an average temperature of 85° F.; winters are short and relatively cold, averaging 32° F. The vegetation is sparse coarse grass.

The Kara Kum conditions the economy of Turkmenistan. Most of the cities and farms and 90 per cent of the population are found in the river valleys and oases. Cotton is the leading crop, followed by wheat and alfalfa. Grapes, melons, and garden crops are grown. Livestock raising prevails in the desert, chiefly cattle (2,000,000 in 1945) and the sheep which furnish wool for the famous carpets of the region. Considerable research and experimentation have been conducted to extend agriculture into the desert, and extensive irrigation systems have been initiated.

Turkmenistan's industrial production has increased since 1920. Mineral chemicals characteristic of desert regions abound. Large amounts of sulphur are mined from the enormous deposits near Zaliv Kara-Bogaz Gol, a gulf of the Caspian Sea. Gypsum, clay, limestone, witherite, iodine, and

bromine salts are also found in abundance. Several hundred thousand tons of petroleum are produced annually at Nebit Dag (Neftedag). Glass, fabrics (cotton, silk, and wool), and livestock products are the principal manufactures. A railroad crosses from Krasnovodsk to Chardzhou, and there is a branch line from Mary to Kushka on the Afghanistan border, the southernmost city of the Soviet Union. Pop. (est. 1954), 1,500,000. *See also* TURKESTAN. R. H. F.

**TURKOMAN.** *See* ASIATIC TRIBES (*Ural-Altaic*).

**TURKS AND CAICOS ISLANDS.** *See* CAICOS ISLANDS.

**TURKU** [tʊ′rkʊ] (*Swed.* Åbo), port city and capital of Turku-Pori province, in southwestern Finland, 95 mi. west of Helsinki. The city is situated at the mouth of the Aura River on the flat plain of Ostrobothnia bordering the Gulf of Bothnia. Turku, an important commercial center in the pre-Christian Era, was the scene of the landings in 1157 of Swedish crusaders who Christianized the country. It was captured by the Swedes in 1553 and enjoyed a period of growth and prosperity until 1713. The Russians, under Peter the Great, controlled the city from 1713 to 1743, and Turku, with the rest of Finland, became part of Russia in 1809. The twentieth century has seen the founding of two new universities, the Swedish Åbo Academy (1918) and the Finnish University of Turku (1922), and the development of art and natural history museums and a city library. Turku, which can be kept open during most winters by the use of icebreakers, is an important port for goods from Sweden and other Baltic countries. Cotton textiles, iron, manganese, tobacco, brushes, and paper are manufactured. Turku is the second largest city of Finland. Pop. 1951, 102,804. J. E. V.

**TURMERIC** [tɜ′rmərɪk], *Curcuma longa,* a perennial plant of the ginger family with tuberous rootstocks from which is derived turmeric, used as a condiment and as a dye. It is extensively cultivated in its native India. Short stems bear narrow leaves, 1½ ft. long, and in autumn spikes of pale yellow flowers 7 in. long. Turmeric powder is prepared from a resinous yellow substance found in the older tubers. It is used in chemistry as an indicator for alkalies, but its principal use is as an important ingredient of curry powder. R. P. T.

**TURN-AND-BANK INDICATOR.** *See* AIRCRAFT INSTRUMENTS.

**TURNER, FREDERICK JACKSON** (1861-1932), American historian and professor, was born in Portage, Wis., Nov. 14, 1861. He graduated from the University of Wisconsin in 1884 and received his Ph. D. degree at Johns Hopkins University in 1890. He was at Wisconsin until 1910; thereafter he taught at Harvard University until 1924, when he became a research associate at the Henry E. Huntington Library in California. Turner was a remarkable teacher with many devoted students. His writings were generally in essay form, but he did complete a volume, *Rise of the New West 1819-1829* (1906), for the American Nation series. Another volume, *The United States—1830-1850, The Nation and Its Sections,* was published posthumously in 1935. Much of his history was an elaboration of his essay, "The Significance of the Frontier in American History." In opposition to the conventional approach of historians in that period, Turner said that the true point of view from which to study American history was not the Atlantic coast, but rather "the Great West." In 1933 he was posthumously awarded the Pulitzer Prize for his *The Significance of Sections in American History* (1932). He died in Pasadena, Calif., Mar. 14, 1932. M. K.

**TURNER, JOSEPH MALLORD WILLIAM** (1775-1851), English painter and engraver, was born in London, Apr. 23, 1775. After a sporadic elementary education, Turner devoted himself to the study of art and entered the Royal Academy schools in 1789. He was elected a member of the Academy in 1802, and, as teacher from 1808 of an Academy course in perspective, he exerted a powerful influence on the development of English landscape engraving. He traveled a great deal, especially in Italy, and found inspiration for many of his later paintings in Venice. His ardent admirer, John Ruskin, devoted some of the most eloquent passages of *Modern Painters* (1843-1860) to a description of his work.

*JOSEPH MALLORD WILLIAM TURNER*

FROM AN ENGRAVING BY W. HOLL

COURTESY OF THE NEW YORK PUBLIC LIBRARY

Trained by the sound architectural draughtsman and topographical artist Thomas Malton, Jr., and developing under the influence of the great seventeenth-century landscapists, Turner extended English topographical painting beyond the antiquarian and reportorial limits, transforming it into a Romantic expression of his own feelings. Graphically this took form most clearly in his hundreds of water colors; in them spatial extent appears bathed with atmosphere and light. The effects he achieved in water colors Turner transferred to oil painting as well. His colors, often of high intensity, retain their relative values effectively and, when coupled with his accurate drawing of shapes, as in the early *Derwenter, with the Falls of Lodore* (c.1797; London, Tate Gallery) or the late *Norham Castle—Sunrise* (c.1835; London, Tate Gallery) are kept within control by the artist. In 1807, Turner began a series of etchings and mezzotints from his own drawings, for a book to be entitled *Liber studiorum.* The work, discontinued in 1820, grew out of his admiration for Claude Lorrain's *Liber veritatis.* Turner died at Chelsea, Dec. 19, 1851, regarded as the titular co-founder, with Thomas Girtin, of English water-color landscape painting. C. P. P.

**TURNIP,** *Brassica rapa,* a biennial herb of the mustard family widely cultivated as a vegetable. There is nothing definitely known about the origin of the turnip, but it is probably a native of northern Europe. In the first season the flattened, white-fleshed, tuberous root produces a tuft of long basal leaves; during the second season or late in the first season, the plant produces a stout stem to 18 in. high bearing yellow flowers and seed pods 2½ in. long. Turnips succeed best in deep, rich, well-drained, light, loamy soil and are easily

grown, thriving best in cool weather, either spring or fall. Early varieties mature in sixty days; late sowings should allow a similar period for growth before frost. V. A. T.

**TŬRNOVO, TIRNOVO,** or **TRNOVO** [ts′rnovo], a city in north central Bulgaria, 80 mi. northeast of Plovdiv, in the sheltered valley of the Yantra River, a tributary of the Danube which has cut a deep, sinuous valley across the northern plateau of Bulgaria. The city has been built in terraces on the steep valley sides and on the narrow flood plain of the Yantra, as well as on two promontories known as Trapezitza and Tsarevitza. Trapezitza, across the river from the city proper, is reached by bridges. Tsarevitza is connected to the city by a causeway. Tŭrnovo was probably a Roman fortress town, and it was the capital of Bulgaria for more than two centuries before its capture by the Turks in 1394. Bulgaria was proclaimed a principality and its constitution was formulated at Tŭrnovo in 1879; establishment of the independent kingdom of Bulgaria was announced there in 1908. Tŭrnovo is a market center for surrounding agricultural regions. One of the local industries is a cotton cloth and thread mill. The city is located near the northern approaches to Shipka Pass and on the roadway using that route. Pop. 1945, 16,182. E. St.

**TURNSTONE,** either of two species of medium-sized (9-in.) wading birds in the genus *Arenaria,* which show alliance to both the sandpipers and plovers. *A. interpres* breeds on arctic coasts and islands around the world and winters on the shores of continents and islands from the North Temperate Zone south to Chile, Australasia, India, South Africa, and Brazil. It has a striking plumage of black, white, and rufous, and has red-orange feet. It is frequently called "calico back" because of its color pattern. The black turnstone, *A. melanocephala,* breeds on the coasts of western and southern Alaska and winters from southeastern Alaska to Lower California. It is marked in a bold pattern of black and white. Unlike the other species, it keeps to rocky ledges. H. G. De.

**TURNUS.** *See* AENEID; VERGIL (PUBLIUS VERGILIUS MARO).

**TURPIN, RICHARD (DICK)** (1706-1739), English robber, was born in 1706 at Hempstead, Essex, where his father was an innkeeper. He was apprenticed to a butcher, but, having been caught stealing some cattle, he joined a gang of smugglers and deer-stealers. When this gang broke up, he entered into partnership with a highwayman, Tom King, in 1735. Turpin accidentally shot and killed his partner, however, and escaped to Yorkshire, where he became a horse trader. In 1739 he was imprisoned for horse stealing, found guilty, and condemned to death. He was hanged on Apr. 7, 1739. The legend of Dick Turpin's ride from London to York on Black Bess, as told in Harrison Ainsworth's romance, *Rockwood* (1834), is fictitious. C. W. D.

**TURQUOISE,** a robin's-egg- or greenish-blue mineral, a hydrous phosphate of aluminum and copper. It has a hardness of 5-6 and a variable density of 2.6-2.8. The mineral crystallizes in the triclinic system and when found is usually massive in form. The indices of refraction are 1.61-1.65. Turquoise is usually fashioned into beads, where the highly polished material with the pleasing color blends well when set with cut or cabochon rubies, sapphires, or emeralds. This semi-precious gemstone is very popular and therefore commands a good price. For centuries, fine turquoise has been mined in Persia. The Sinai Peninsula and Turkestan also yield this mineral. Nevada, New Mexico, and California supply a greenish-blue turquoise that is mined, cut, and polished by native Indians for sale to tourists as well as to the jewelry industry. Ceramic imitations of turquoise do not fade with the passage of time. A. E. A.

**TURTLE,** a member of the reptilian order, Testudinata or Chelonia. Turtles evolved over 160,000,000 years ago as toothed land reptiles; they flourished during later ages, losing teeth, perfecting armor, and developing fresh-water and seafaring branches. Today, there are less than 300 surviving species distributed among twelve families. Although living species are few, individuals are often numerous, particularly in warm, sluggish fresh waters.

Turtles have had a distinctive appearance for millions of years. The short, broad body is incased in a boxlike bony

*Leatherback,* Dermochelys coriacea, *the largest existing sea turtle, reaches a length of 8 ft.*

shell having upper (carapace) and lower (plastron) parts. If the shell is commodious enough to afford complete protection to head and limbs, the species is rarely aggressive; however, incompletely armored turtles often bite readily, their powerful jaws being capped with sharp-edged horny sheaths in place of teeth. Turtles, including aquatic species, breathe by lungs. Some water tortoises use the air dissolved in the water, and do not come to the surface so often to breathe.

Reproduction is always by eggs, which are spherical and covered by a tough, membranous, or hard, brittle shell. They are buried in sand or loose earth, and usually hatch in a few months; sometimes the young may not emerge until the following spring.

Many turtles are valuable to man. Large marine species yield flesh, shell, and oil (from eggs). Several species of fresh-water turtles are highly prized as food. M. G. N.

**TURTLE CREEK,** a borough in Allegheny Co., in southwestern Pennsylvania, located 12 mi. southeast of Pittsburgh, near the Monongahela River, a part of the industrial district of greater Pittsburgh. The territory was included in the hunting grounds of the Iroquois Indians and had no permanent Indian settlements until after 1722. The district was the scene of much fighting in the French and Indian War; and Sycamore Street in Turtle Creek follows the course of a military road built through the area in 1763 to Fort Pitt. The borough's first permanent white settler was Martha Miers, a widow who received a land grant from

the Penn family in 1769. The community, incorporated in 1892, has the mayor-council form of government. The Pennsylvania and Union railroads serve this industrial borough, whose factory output consists of electrical and railway equipment and steel. Pop. 1950, 12,363.

**TURTLEHEAD,** a small group, *Chelone,* of perennial plants of the figwort family, which owe their common name to the somewhat strange appearance of the flower. There are three species, all native to North America and sometimes grown in gardens. The plants reach a height of 2 to 3 ft., and have pointed toothed leaves and large white or purple flowers in short, crowded, leafy spikes. The white turtlehead, *C. glabra,* is common in swamps and along streams east of the Great Plains; the purple turtlehead, *C. lyonii,* is native to the southern Appalachians; and the red turtlehead, *C. obliqua,* occurs in the southeastern United States. *Penstemon nemorosus,* the so-called western turtlehead, bearing violet-purple flowers, was formerly classed with this group. J. C. Wis.

**TUSCALOOSA** [tʌskəlu′sə], a city in west central Alabama, the county seat of Tuscaloosa Co., situated on the Black Warrior River, 60 mi. southwest of Birmingham. The first permanent white settlement on the site was made in 1816 by a group of ten from Tennessee. Incorporated as a city in 1819, Tuscaloosa served as the state capital from 1826 to 1846. During the Civil War the community was raided by Union troops in 1865, and the buildings of the University of Alabama, which had opened in 1831, were burned. In 1869 the university was re-established. Tuscaloosa is also the seat of the Stillman College for Negroes. The city's hospital facilities include Bryce State Hospital for the insane, Partlow State School for the feeble-minded, an army hospital, and a veterans' hospital. Sites of interest in or near the city include Smith Hall, the university's museum; Gorgas Home, home of Brig. Gen. William C. Gorgas; and Mound Park, 16 mi. south of the city, which contains a group of 34 Maya Indian mounds on a 300-acre tract of land preserved in co-operation with the National Park Service. The city is served by the Southern, the Gulf, Mobile and Ohio, and the Louisville & Nashville railroads. Cotton growing, coal mining, and lumbering are interests of the region, and the manufacture of paper, rubber, chemical, and lumber products are the city's chief industries. Pop. 1950, 46,396.

**TUSCAN ARCHIPELAGO,** a group of seven islands and several islets and shoals in the Tyrrhenian Sea between Corsica and the Italian mainland. They are the peaks of a bridge of land which connected Tuscany with Corsica, Sardinia, and North Africa in the Pliocene Age, but which was submerged in the Quaternary epoch. The islands and their areas in square miles are: Elba, 85; Giglio, 8½; Capraja, 7½; Montecristo, 4; Pianosa, 3½; Giannutri, 1; and Gorgona, 1, making a total of 110½ sq. mi. The population is about 40,000. Giannutri is the southernmost island; Gorgona is the northernmost and wholly mountainous, reaching an altitude of 1,050 ft. in Punta Gorgona. This island was settled in ancient times by Christian refugees and monks; it later passed through several hands, notably those of the Pisans and Florentines, until under united Italy it was made an agricultural penal colony. Gorgona's free population lives by fishing and artisanry. The island forms part of the commune of Leghorn, and before World War II had a population of about 250. *See also* Elba; Giglio; Leghorn (*Province*); Montecristo; Pianosa; Piombino. R. G. W.

**TUSCAN ORDER.** *See* Architectural Orders.

**TUSCANY** [tʌ′skəni] (*Ital.* Toscana), in north central Italy, one of the modern Italian regions. It is bounded on the north by Emilia, on the east by the Marches and Umbria, on the south by Latium and the Tyrrhenian Sea, and on the west by Liguria and the Ligurian Sea. The Apennine Mountains form the boundary on the north, except northeast of Florence, where the region includes a strip on the northern side of the divide. Tuscany has an area of 8,879 sq. mi. and embraces the nine provinces of Arezzo, Siena, Grosseto, Livorno (Leghorn), Pisa, Lucca, Pistoia, Firenze (Florence), and Massa e Carrara.

**Geography.** Tuscany is essentially a region of mountains and hills, the only large lowland areas being the lower Arno Valley and the coastal zone called the Maremma. In addition to the Apennines, there are the Apuanian Alps east of Massa and Carrara, the isolated Monti Pisani between Lucca and Pisa, the Metallic Hills (Colline Metallifere) between Siena and the Tyrrhenian Sea, the low Chianti Mountains south of Florence, the Pratomagno range east of that city, Monte Amiata in the south, and others. Besides the Arno and its principal tributaries (Era, Elsa, Bisenzio, and Sieve), the chief rivers are the Serchio, draining the valley of the Garfagnana north of Lucca, and the streams draining into the Tyrrhenian Sea. Off the coast lies the Tuscan Archipelago, consisting of the islands of Elba (the largest), Gorgona, Capraja, Pianosa, Montecristo, Giglio, and Giannutri.

**Climate.** The climate varies according to altitude, but in general is moderate, showing strong marine influence from the west; protection is afforded from hard winters by the mountains to the north. A few snowfalls occur each year in the hill country and more frequently in the mountains. The typical average annual rainfalls are: Florence, 35 in.; Grosseto, 26 in.; and Camaldoli, in the mountains, 70 in. Fall and winter are the rainy seasons, with summers generally dry, especially in the Maremma on the coast.

**Population.** The estimated population in 1947 was 3,098,000. The 1936 census gave a density of around 355 per square mile, somewhat below the national average. However, the density varies greatly within the region. The most heavily populated zone is the lower Arno Valley from Florence to the sea, plus the Tyrrhenian coast from Carrara to Cecina. Regions of heavy density are also found around Siena, in the Chianti district, and in the iron-mining and smelting zone on Elba Island. Southern Tuscany is generally low in density of population. There has not been a heavy outflow of emigrants from Tuscany, except from Lucca and from Massa e Carrara. In 1913, the peak year for emigration, 40,000 left the region, but mostly for temporary work in other European countries. About one third of the inhabitants of Tuscany live in scattered dwellings, the rest in urban centers.

**Economic Life.** Tuscany is a predominantly agricultural region, highly productive and with almost no barren land. Not all of the productive land is in cultivation, but in recent decades swampy areas in the Arno and other valleys, and in the Maremma along the coast, have been reclaimed. About 30 per cent of the land is in the mountains, 60 per cent in hilly country, and 10 per cent on the plains. One half of the farmland is operated on shares, *mezzadria.* Out of 254,144 farm units before World War II, 115,480 were operated by their owners, and 106,695 by share-farmers. Wheat is the leading product, followed by corn, rye, and oats. Important also are vegetables, olives, and grapes. The more famous wines include those of the Chianti area, and Montepulciano.

Silkworms are raised in the lower Arno Valley and around Siena. Tuscany is the most heavily forested of all Italian regions, despite considerable deforestation during the last two centuries; chestnuts grow in a large part of the wooded area. Tuscany is not a pastoral region and possesses comparatively small numbers of livestock, including 400,000 cattle and 900,000 sheep. Fishing is carried on from several ports along the Tyrrhenian coast.

The output of the iron mines on Elba Island represents nine tenths of that of the entire country. Mercury is mined on Monte Amiata and boric acid is obtained from the mineral hot springs at Larderello, near Volterra. Near the latter are also salt mines, from which about 100,000 tons are taken yearly. The low-grade lignite deposits were worked for about 500,000 tons a year before World War II. The most valuable of the region's mining resources is the marble quarried in the Apuanian Alps, east of Massa and Carrara.

Manufacturing is not a leading activity in Tuscany and only about a third of the working population is engaged in industry, very broadly defined. Electricity is produced only in moderate quantity, about half by water power and half by steam; there are lignite beds and hot springs at Larderello. The iron ore of Elba is largely smelted at Piombino and Portoferraio. Leghorn possesses famous shipbuilding yards, while Pisa and Empoli are noted for their glass. Prato is one of Italy's leading wool-manufacturing centers. Florence produces a variety of articles, including ceramic goods and art goods. The latter are also turned out in many other cities and towns where the old craftsmanship survives.

The railway network is adequate, except in the province of Grosseto, where population is sparse and much land is uncultivated. In 1934 the new *direttissima* from Florence to Bologna, requiring thirty-seven tunnels and constituting a major engineering feat, was opened; it cuts 20 mi. from the distance and an hour and a half from the time required via the old Porretta line. The highway system was expanded and improved following World War I, and the *autostrada* from Florence to the sea via Pistoia and Lucca was constructed. Leghorn is the fifth port in Italy. Smaller harbors in Tuscany are Portoferraio, Viareggio, Marina di Carrara, and Porto S. Stefano.

**History.** In pre-Roman times that part of the region in the vicinity of the lower Arno was a border zone between the Ligurians and the Etruscans. The latter were subjected to Rome in the middle of the fourth century B.C., and the name Tuscia came to be applied to the region. After the decay of the Roman Empire, Tuscia was invaded by Goths, Byzantines, and Lombards, whose wars devastated wide tracts. The Lombards (568-774) and the Franks managed to preserve fairly intact the administrative unity of Tuscany, with Lucca as the chief city. The feudal line installed by the Franks ended in 1115, on the death of Matilda of Tuscany. By bestowing her domain on the Holy See, she initiated a long struggle between the popes and the emperors, of which the net result was the rise in power of the cities, e.g., Pisa, Lucca, Florence, and Siena, and the destruction of the political unity of Tuscany.

*The Villa Medici in Fiesole, Tuscany. The city of Florence is seen in the distance.*

COURTESY OF THE ITALIAN NATIONAL TOURIST OFFICE

Among the cities, Lucca and Pisa, usually at swords' points, led during the eleventh and twelfth centuries, with the latter victorious in the Arno Valley but defeated by Genoa on the sea in the battle of the Meloria in 1284. In the early thirteenth century Lucca appeared to be headed for Tuscan hegemony under Uguccione della Faggiuola and Castruccio Castracani degli Antelminelli. But soon Florence, which had domination over Pistoia and Arezzo, resumed her forward march. Pisa lost its independence in 1406 and Siena in 1559. The primary instrument of this Florentine expansion was the Medici family, who in effect ruled the city from the early fifteenth century to the middle eighteenth century, with short intermissions from 1494 to 1512 and from 1527 to 1530. The title of Grand Duke of Tuscany was accorded Cosimo I in 1569 and recognized by the emperor in 1575. Some of the Medicean line sought to improve economic and agricultural conditions, but in general they did not contribute much to their subjects' welfare. The family was extinguished with the death of Giovan Gastone in 1737, but not until it had achieved some notoriety through its connections with other dynasties, particularly in France.

The rule passed to the house of Lorraine under Francis I, husband of Maria Theresa and Holy Roman Emperor after 1745, who was represented at Florence by regents. He died in 1765 and was followed by his son Leopold II, whose high capabilities were supplemented by a reformer's zeal in political affairs and economic development. Upon becoming

the Roman emperor in 1790, he bestowed the Grand Duchy of Tuscany upon his son Ferdinand III.

A period of upheaval was ushered in by the French Revolution and its armies. The first French invasion, 1799, was soon repelled, but in 1800 Napoleon's forces were back, and in 1801 Tuscany was made the Kingdom of Etruria within the Spanish domain. From 1807 to 1809 it was a French department, but in the latter year Napoleon's sister, Elisa Bacciocchi, became Grand Duchess. In 1814, Ferdinand III returned and failed to support the blindly reactionary policies evident in so many other European states at the time. He was followed in 1824 by his son Leopold II, who in 1848 acceded to the revolutionary movement of the times by granting a constitution. In February 1849 the proclamation of a republic obliged him to flee to Gaeta, whence he returned a few months later under protection of Austrian arms. He withdrew the constitution in 1852, and in 1859 was obliged by the pro-Italian fervor of his subjects to leave again. A provisional government declared war on Austria and, despite French pressure to readmit Leopold, voted for the annexation of Tuscany to the Kingdom of Sardinia, which in 1861 became the Kingdom of Italy. R. G. W.

**TUSCARORA.** *See* INDIAN TRIBES, NORTH AMERICAN (*Eastern Woodland*).

**TUSCARORA WAR** [tʌskərɔ′rə] (1711-1713), an attempt by the Tuscarora Indians living in North Carolina to wipe out the white people in that area. A powerful tribe of the Iroquois family, they had several villages and over a thousand warriors. In 1711, encouraged by the French, they began their attacks. However, nearly 400 of the Indians were killed early in 1712, which prompted them to make a treaty with the white settlers. The treaty was soon broken, however, and the Tuscarora were defeated again in 1713 by North and South Carolina troops. This time the power of the Indians was broken, for 800 of them were captured. The remnants of the tribe fled north of the Ohio River and there joined the Iroquois Confederacy, becoming the "sixth" nation. M. Je.

**TUSCULUM COLLEGE** [tʌ′skyuləm], an accredited, coeducational, privately controlled college, affiliated with the Presbyterian Church. It occupies 122 acres in the suburbs of Greeneville, Tenn. The charter was granted originally to Greeneville College in 1794, and first instruction was given two years later. A merger with Tusculum Academy in 1896 resulted in a change of name to Greeneville and Tusculum College. The name was changed to the present form in 1913. Only the A.B. in liberal arts is awarded. The offerings in the departments of business administration, physical education, and religious education, particularly, have been expanded within recent years. Dormitories have been provided and residence in them is required of all except day students. A small number of scholarships are available. *For statistics see* COLLEGES AND UNIVERSITIES. J. R. To.

**TUSCUMBIA** [tʌskʌ′mbiə], a city in northwestern Alabama, the county seat of Colbert Co., situated on the Tennessee River, 108 mi. northwest of Birmingham. The city, founded in 1817, had the commission form of government in 1951. It is the birthplace of Helen Keller. Cotton, corn, and cattle are raised in the area, and the chief manufactures are fertilizers and aluminum and rubber products. Wilson Dam at Muscle Shoals is 4 mi. north of the city, which has transportation facilities supplied by the Southern Railway. Pop. 1950, 6,734.

**TUSHINGHAM, SIDNEY** (1884- ), English etcher and painter, was born in Burslem, Staffordshire, in 1884. Following a family tradition which went back to the early eighteenth century, Tushingham at the age of fourteen became an apprenticed porcelain painter, attending at the same time the Burslem School of Art. In 1905 he entered the Royal College of Art in London, and studied under G. Moira and Sir Frank Short. Under the latter, Tushingham made dry points and etchings. An accurate architectural and landscape draughtsman, Tushingham has done many views, especially Venetian and Spanish scenes, and many portraits of children. Among his notable prints may be mentioned *Noonday Rest, Venice* (1926), *Florence* (1931), *Plaza San Martin, Segovia* (1932), *Puerta del Puente, Cordova* (1933). J. S. By.

**TUSKEGEE** [tʌski′gi]. *See* INDIAN TRIBES, NORTH AMERICAN (*Southeast*).

**TUSKEGEE INSTITUTE,** an accredited, coeducational, privately controlled technological college for Negroes. It is located on a campus of 110 acres in Tuskegee Institute, Macon Co., Ala. The college was founded by Booker T. Washington in 1881, the year that the legislature of Alabama passed an act to establish a normal school. Under the name Tuskegee Normal and Industrial Institute, combined vocational and classroom instruction was given from the beginning on the high-school level. College courses started in 1923, and the high-school department was discontinued in 1939. The name was changed to the present form in 1937. The numerous divisions of the institute were founded as follows: School of Agriculture, 1923; School of Economics, 1923; Summer School, 1923; School of Education, 1925; School of Mechanical Industries, 1925; School of Nurse Training, 1926; School of Physical Education, 1930; and School of Veterinary Medicine, 1945. Land owned in addition to the campus includes 600 acres of cultivated farmland, 1,140 acres of pasture and woodland, and the 1,700 acres of the Russell Plantation. The co-operative work-and-study courses in agriculture, commercial dietetics, and mechanical industries extend the undergraduate period to five years. Graduate work leading to the master's degree is given in agriculture, home economics, and education. The library contains a large collection on the history and life of the Negro, an agricultural and trade collection, an art gallery, and a museum of African art.

Many fellowships and scholarships are offered and there are some graduate research assistantships and fellowships for work in chemistry provided by the George Washington

*Tompkins Hall, which houses the dining and recreation facilities for the students and faculty of Tuskegee Institute*

Carver Foundation, supplemented by grants from several industrial corporations. Dormitories are provided for men and women. *For statistics see* COLLEGES AND UNIVERSITIES.

J. R. To.

**TUSSOCK MOTH,** the common name given to many members of the family Lymantriidae. The name is derived from the fact that the caterpillars have large tufts and long pencils of hair on the body and thorax, usually two long pencils in front and one behind, as in the genus *Hemerocampa. H. leucostigma* is a common species in eastern North America, while *H. vetusta* occurs on the west coast. The female is wingless and lays her eggs in a white, frothy mass, usually on the cocoon from which she has emerged. They are often serious pests, occurring in such numbers as to defoliate trees. Many of the larvae are provided with barbed, poisonous hairs that produce an irritating skin rash. Related forms are the gypsy moth and browntail moth, both of which, together with the satin moth, have been accidentally imported from Europe. C. H. Cu.

**TUTANKHAMEN (TUTENKHAMON)** [tu′tɑŋkɑ′mən, tu′tɛŋkɑ′mən] (c. 1364-1346 B.C.), Egyptian pharaoh, of the Eighteenth Dynasty, was born about 1364 B.C. He is a minor figure in Egyptian history, but discovery of his tomb by British archaeologists in 1922 created a sensation because it was one of the few royal tombs in Egypt which had not been plundered by grave robbers. Tutankhamen was an Egyptian of noble birth who married the third daughter of the famous heretic pharaoh Ikhnaton. Since Ikhnaton had no sons, Tutankhamen, as the husband of a princess, became a logical candidate to succeed him. A mere boy at the time of his accession in 1355 B.C., he ruled for nine years and was only about eighteen when he died in 1346 B.C. Because of his youth he exercised little authority, and his reign was characterized by a conservative reaction against the Aton-worship which Ikhnaton had tried to establish. Tutankhamen began to rule under the name of Tutankhaton, but as the priesthood of Amon (Amen)-Ra regained its old influence, the young pharaoh was forced to change his name to Tutankhamen. T. B. J.

**TUTELO.** *See* INDIAN TRIBES, NORTH AMERICAN (*Eastern Woodland*).

**TUTICORIN** [tu′tɪkorɪ′n], a port city at the southern tip of India, in Madras State, located about 100 mi. south of Madura, on the Gulf of Mannar, across from Ceylon. The first Europeans to occupy the city were the Portuguese in 1540. They were followed by the Dutch, and the English captured the port in 1825. Tuticorin, Madras' second port, serves as the shipping point for goods being shipped to and from Colombo on the island of Ceylon. It is also a pearl-fishing center and a market for the district's cotton, rice, millet, Palmyra fiber, dried fish, cement, and asbestos products. It is the east-west terminus of the railroad crossing southern India. Pop. 1951, 98,866. J. E. F.

**TUTTI.** *See* MUSICAL TERMS.

**TUTUILA** [tu′tuɪ′lɑ], an island belonging to the Samoan group, northeast of the Fiji Islands in the South Pacific Ocean at 14° 20′ S. lat. and 170° 45′ W. long. Tutuila, together with other islands in the group east of it, belongs to the United States. It is 17 mi. long and 5 mi. wide. The remarkably fine, beautiful harbor on the south side, where Pago Pago is situated, is the submerged crater of an extinct volcano. Although the island is small and mountainous, it contains about 10,000 Polynesian natives living in scattered villages both on the coast and in the interior. Most of them are subsistence farmers. Copra is the only important export, aside from articles of native handicraft sold to tourists who stop briefly in Pago Pago on the regular steamship run from California to Australia. Pop. 1950, 15,556. R. G. B.

**TUVA AUTONOMOUS OBLAST (REGION)** [tu′və], formerly the Tannu Tuva People's Republic, an administrative unit of the Russian Soviet Federated Socialist Republic, in the south central section of the Asiatic Soviet Union. It is bounded on the north by Khakass Autonomous Oblast and the Krasnoyarsk and Irkutsk oblasts, on the east by the Buryat-Mongol Autonomous Soviet Socialist Republic, on the south by Outer Mongolia, and on the west by the Oirot Autonomous Oblast. It has an area of almost 80,000 sq. mi. Following the Chinese Revolution of 1911 the Tuvinians, once called the Uriankhai, declared their independence. But their sovereignty was short-lived, for, despite the protests of China, Tsarist Russia absorbed the country in 1913. The disruption of Russia by the Revolution of 1917 led to the recognition of an independent Tannu Tuva. However, after 1920 the economy of Tannu Tuva appears to have come increasingly under Soviet influence. Numerous Russian scientific and engineering expeditions visited the area, and in 1921 the Tuvinians chose to call their country the People's Republic of Tannu Tuva. This development was subsequently recognized officially by the Soviet Union and the Mongolian People's Republic. In October 1944 this protectorate, as it was in essence, was incorporated into the Soviet Union as the Tuva Autonomous Oblast.

The oblast occupies a large valley between the Tannu-Ola Mountains on the south and the Savinsky Range on the north. The latter ridge, lying north of the Sayan Mountains, is a part of the Dzhebash Range. Originating within the confines of the Tuva Valley are the Khua Kem and the Bei Kem, the two streams which unite to form the mighty Yenisei River. At the fork of the rivers is located Kyzyl, the capital. Despite the presence of rich black soils, the natives, of Turkic and Mongolian origin, were nomadic herdsmen, for the region is the southernmost limit of the reindeer belt. Now collectivized and settled, the Tuvinians are producing enough wheat for export, and are exploiting the abundant reserves of coal, iron ore, copper, gold, silver, cobalt, platinum, asbestos, and, reportedly, uranium. Electric power stations are in operation. Although the oblast had no railroad in 1950, it was in touch with Abakan, the capital of the Khakass Autonomous Oblast, by a paved road, and the Yenisei River makes the near-by highly industrialized Kuznetsk-Minusinsk district accessible. Pop. (est. 1954), 175,000.

**TWEED, WILLIAM MARCY** (1823-1878), American political boss, was born on Apr. 3, 1823, in New York City. He attended schools in New York and in Elizabeth, N. J., and became a bookkeeper. In 1850 Tweed organized a volunteer fire department in New York City and took advantage of the popularity he gained from this venture by running for New York City alderman in 1852. He was elected and served as alderman for four years. During that time he was

elected to the Federal House of Representatives but after one term, 1853-1855, returned to full-time participation in municipal politics. He was defeated for re-election as alderman in 1856 but managed to be elected to a new board of supervisors, set up to check corruption at elections. Under Tweed's machinations the new board soon degenerated into a corruptive body. Tweed managed to get his friends appointed to such important city offices as district attorney, recorder, and county clerk; these appointments were the foundation of the Tweed machine. By 1859 Tweed was the

WILLIAM MARCY TWEED

BROWN BROTHERS

most powerful figure in Tammany Hall and practically dictated the Democratic nominations. He dominated the Democratic State Convention in 1860 and by skillful political maneuvering, accompanied by liberal bribes, all but controlled the state by 1868. Tweed ran the Democratic Party and captured elections from the opposition by coercion, bribery, and illicit votes. He amassed his funds for bribery and his vast personal fortune by raiding the municipal treasury systematically. He organized a law office, though he knew little law, and received huge "retainers" from such favor-seeking clients as Jay Gould's Erie Railroad. He established a printing company and assigned all city printing to that organization; companies dependent on Tweed's friendship for their own survival also patronized the firm. Tweed set up a marble company, began the construction of a new county courthouse, and then sold his own marble to the city at fraudulent prices. He also set lower taxes and sold city bonds at ridiculously low rates, for considerations from the persons or companies involved. Tweed was a member of the New York State Senate from 1867 to 1871 and in 1868 was elected Grand Sachem of Tammany Hall, an honor he sought to accompany the power he had.

Meanwhile certain civic groups and individuals, particularly Samuel J. Tilden, chairman of the Democratic State Committee, Thomas Nast, the cartoonist, and George Jones, owner of the *New York Times,* were attacking Tweed, and when the *Times* obtained and published factual information concerning his thefts of public money, Tweed was arrested for fraud on Dec. 16, 1871. The jury disagreed at his first trial but at his second he was convicted and sentenced in November 1873 to twelve years' imprisonment on Blackwell's Island, New York. He was released in January 1875, little more than a year later, but was immediately rearrested to face an action brought by the State of New York for recovery of the more than six million dollars Tweed had taken from the city. He was confined to the Ludlow Street Jail but escaped in December 1875 and fled to Cuba and then to Spain. He was arrested in Spain and returned to the United States in November 1876 and again confined to Ludlow Street Jail, where he died, Apr. 12, 1878.

W. E. A.

**TWEED,** a river in southern Scotland. The Tweed rises at Hart Fell in the southern uplands of Peebles County, 1,500 ft. above sea level, and flows generally east, through broad fertile valleys and small wooded hills, to empty into the North Sea at Berwick-on-Tweed, running a total distance of 103 mi. Its last miles form the border between Scotland and England. Celebrated in poetry and romance, the "silver Tweed" flows past the famous abbey sites of Melrose, Kelso, and Dryburgh. Its principal tributaries are the Whiteadder, Till, Leader, Ale, Teviot, Gala, and Ettrick rivers. Peebles, Galashiels, Coldstream, and Berwick-on-Tweed are among the principal cities on its banks. S. Van V.

**TWEEDSMUIR PARK.** *See* CANADIAN PROVINCIAL PARKS.

**TWELFTH NIGHT.** *See* HOLIDAYS AND HOLY DAYS.

**TWELFTH NIGHT** (1601-1602), a comedy by Shakespeare. More carefully planned than *As You Like It,* more poetical than *Much Ado About Nothing,* it presents a happy balance of plot, characterization, and diction. Character is not sacrificed to plot, nor does the action become a mere background for the display of characters. The main plot, derived ultimately from an Italian *novella,* deals with the hapless love of Viola, disguised as a page, for her master, Duke Orsino. She bears his messages of love to the Lady Olivia, who at once falls in love with her. When Viola's twin-brother Sebastian appears, Olivia mistakes him for the page and marries him off-hand. The tangled situation is cleared up when brother and sister meet and recognize each other; the Duke rewards Viola's devotion by an offer of marriage, and all ends happily.

This romantic story is set against a background of daily life in Olivia's household, crowded with realistic figures: Olivia's conceited steward, Malvolio; her mischievous waiting-maid, Maria; her hard-drinking cousin, Sir Toby Belch; and her foolish suitor, Sir Andrew Aguecheek. By means of a forged letter Sir Toby and Maria trick Malvolio into believing that his mistress loves him, and his absurd behavior thereafter leads to his temporary confinement as a madman. A singing clown wanders back and forth between the households of Olivia and the Duke; the play begins with music and ends with a song. T. M. P.

**TWENTY-ONE DEMANDS,** a Japanese attempt to secure hegemony over China in 1915. On January 18, the Japanese minister to China presented President Yüan Shih-k'ai, the Chinese dictator, with twenty-one demands. Arranged in five groups, the demands commanded China to agree to Japan's settlement of German rights in Shantung; to concede Japanese pre-eminence in communications and in economic and political affairs in south Manchuria and eastern

Inner Mongolia; to convert China's biggest mining and smelting concern, the Hanyehp'ing ironworks, into a joint Japanese-Chinese firm; not to cede or lease any bay, harbor or island on the Chinese coast to another power without Japan's consent; and to appoint Japanese military and financial advisers in the Chinese government. Preoccupation of the other great powers with World War I gave Japan her opportunity to seek domination over China. On Aug. 23, 1914, Japan declared war on Germany. Shortly thereafter the Japanese notified China that military necessity required the Japanese occupation of wholly Chinese territories in the vicinity of the German-leased territory of Chiaochou (Kiaochow). In a vain attempt to limit the extent of war on her own territory, China defined a war zone Sept. 3, 1914, within which the belligerents were requested to operate. The Japanese disregarded these limits in attacking the German garrison overland and in occupying the railway line inland to Tsinan. The Germans surrendered November 7, after a skillful defense. Two months later the Chinese government issued a declaration abolishing the war zone and requesting the Japanese to withdraw their forces to the German territories only.

The Japanese then determined to settle outstanding issues between themselves and China by issuing the twenty-one demands. Although the Japanese minister to China prohibited Chinese publication of the demands, the news leaked out.

The Chinese refused full agreement, but negotiated a compromise arrangement which gave Japan extensive economic rights, prolonged Japan's legal tenure in Manchuria, and laid the foundation for future Japanese aggression which preceded World War II. These concessions were embodied in two treaties signed May 25, 1915. D. Ch.

**TWI.** *See* AFRICAN PEOPLES.

**TWILIGHT,** a phenomenon of the atmosphere, referring to the light of the sky before sunrise and after sunset. The morning astronomical twilight is defined as beginning when the sun's center is 18° below the eastern horizon. Nautical twilight begins at 12° below, and civil twilight at 6° below. Similarly, evening twilight ends when the sun's center is respectively at the same positions below the western horizon. When the sun's altitude is —18°, the faintest naked-eye stars are generally visible. During twilight, the air of the atmosphere is illuminated, and is reflecting and scattering the solar light. Total absence of a twilight zone on the moon betrays an absence of atmosphere on that globe. The duration of twilight varies with the latitude of observation and the time of year. The minimum is 1 hr., 8 min. at the equator at equinox times; at latitude 40° it is 1 hr., 30 min. at the equinoxes; and, in high latitudes, twilight lasts all night in the summer, or the "midnight sun" may be in evidence. H. S. R.

**TWINBERRY.** *See* PARTRIDGEBERRY.

**TWIN FALLS,** a city in southern Idaho, the county seat of Twin Falls Co., situated on Rock Creek, a tributary of the Snake River, about 147 mi. southeast of Boise. The farmers in the surrounding irrigated region engage in diversified agriculture. Founded in 1904 and named for the near-by Twin Falls on the Snake River, the community was first incorporated in 1905. In 1951 it had the city-manager form of government. North of the city is the Black Lava Canyon of the Snake River, spanned by a bridge 476 ft. high, and 6 mi. north is the famous Shoshone Falls. Transportation facilities are provided by the Empire and United air lines and the Union Pacific Railroad. The village's economic interests are connected with the agriculture of the region, and the industrial establishments include a sugar-beet factory, starch plant, creamery, and cannery. Pop. 1950, 17,600.

**TWINFLOWER,** a delicate, trailing evergreen plant, *Linnaea borealis,* of the honeysuckle family, growing in moist woods throughout the cooler parts of the North Temperate Zone. The slender stems bear bell-like, pinkish flowers in pairs above small oval leaves. This lovely woodland plant was named for Linnaeus, the great Swedish botanist, at his own request, as it was his favorite flower. The American form, *L. b. americana,* is found from Labrador to Alaska, and in the mountains south to Maryland and California. G. M. Sm.

*TWINFLOWER,* LINNAEA BOREALIS

**TWINS.** *See* EUGENICS.

**TWO GENTLEMEN OF VERONA, THE** (c. 1593), one of Shakespeare's early comedies. The playwright drew his material for this play from Montemayor's *Diana Enamorada,* a popular Spanish romance which he may have read in a French translation. He tried to convert a rambling narrative into a romantic comedy, but with little success. Shakespeare's mastery of his art was as yet incomplete, for in plot construction this is one of the weakest of his plays. The two gentlemen are the friends, Proteus and Valentine. Proteus is in love with Julia, but deserts her—and betrays Valentine—to win the hand of Sylvia, whom Valentine loves. In the last scene the friends are reconciled, Valentine wins Sylvia, and Proteus is reunited with Julia, who has followed him disguised as a page.

The action of the play is slow in starting; the denouement is hurried and forced. On the other hand, Shakespeare succeeded in making character account for plot; there would be no action at all if Proteus had not been fickle and Julia faithful. The two servants, especially Launce with his dog, add a dash of realistic comedy to a romantic play, but the peculiar charm of *The Two Gentlemen* is the lyric grace of its poetry. T. M. P.

**TWO KETTLE.** *See* Indian Tribes, North American (*Plains*).

**TWO RIVERS,** a lake port and city in eastern Wisconsin, in Manitowoc Co., on Lake Michigan, about 90 mi. north of Milwaukee, at the mouth of the East Twin and the West Twin rivers. Founded in 1836 and named for its location at the junction of the rivers, the community was incorporated as a city in 1878. In 1951 it had the council-manager type of government. The Chicago and North Western Railway furnishes transportation, and the city's harbor is used by a commercial fishing fleet and barges delivering coal. Timber is a natural resource of the region, and local industries produce aluminum, plywood, electrical products, woolens, and metalware. The surrounding forest and lake country, together with the city's bathing and fishing facilities, attracts many vacationists. Pop. 1950, 10,243.

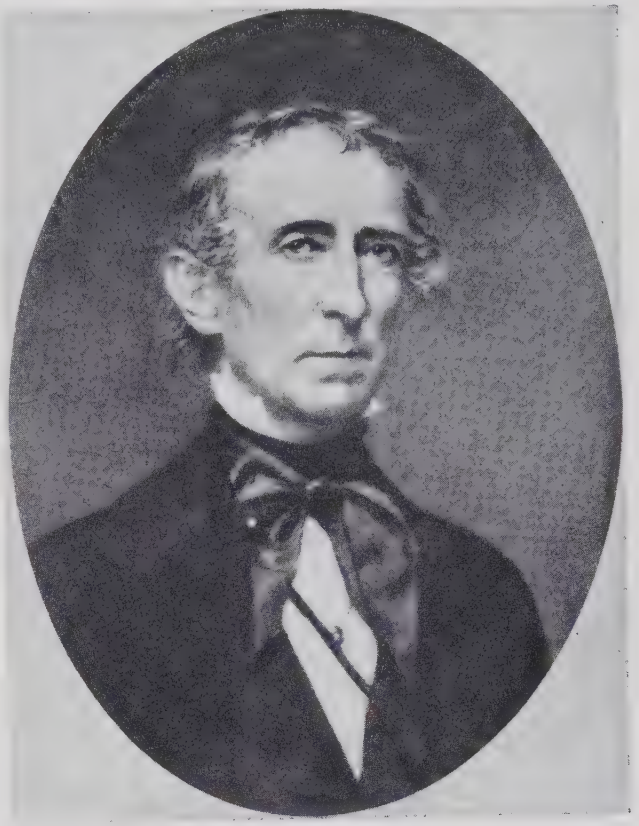
**TWO SICILIES, KINGDOM OF THE.** *See* Sicily (*History*).

**TYLER, JOHN** (1790-1862), tenth President of the United States, was born at Greenway, Charles City County, Va., on Mar. 29, 1790. His father, Judge John Tyler, Governor of Virginia 1808-1811, and his mother, Mary Armistead Tyler, were both of English descent. He was educated at a neighborhood school and at William and Mary College, from which he graduated in 1807. He read law under his father and was admitted to the bar in 1809.

**Public Life.** During the War of 1812, Tyler served for a short time in a local militia unit which did not see active service. In 1811 he was elected to the Virginia legislature, serving until 1816, when he was sent to the House of Representatives from his home district. As a member of the House from 1816 to 1821, Tyler, unmoved by the wave of nationalism in the country, supported the states' rights and strict constitutional interpretation of the early Jeffersonians. In doing so he opposed the majority of his party by voting against the rechartering of the Bank of the United States, the tariff acts, and internal improvement measures. A pro-slavery man, he was convinced that the national government had no constitutional right to restrict slavery in any territory, and consequently voted against the Missouri Compromise Act. During the remainder of his life Tyler refused to vary the strict constitutional and slavery views he held in his youth.

Because of failing health he left Congress in 1821 and returned to Virginia, where he lived quietly as a private citizen for two years. In 1823 he was again elected to the state legislature and became governor of Virginia in 1825. Two years later he was elected to the United States Senate in the place of John Randolph of Roanoke. In 1824 Tyler supported W. H. Crawford for president and opposed Andrew Jackson, whom he considered merely an able frontier fighter and not a statesman. In 1828, however, he was more opposed to John Quincy Adams than to Jackson and actually supported the new President during the first part of his administration. Tyler was equally opposed to South Carolina's nullification of the national tariff act and Jackson's Force Bill, and he was the only Senator to cast a vote against the latter measure. Breaking with the Jackson Democrats after the Force Bill had passed, he became a member of a Southern Rights faction, which acted with the National Republicans, later Whigs, but which had little in common with Whig principles. Tyler remained in the Senate until 1836, supporting Jackson on the Bank issue, but bitterly opposing the President's withdrawal of funds from the Bank. He resigned his seat in 1836 rather than follow the instructions of the Virginia legislature to support the resolution expunging from the Senate minutes a previous censoring of President Jackson.

**The Presidency.** Tyler was nominated in 1836 for the vice-presidency by a group of states' rights Whigs and received 47 electoral votes in the following election. Four years later, in the belief that he would help carry the South, he was selected by the Whigs as their vice-presidential candidate on a ticket headed by William H. Harrison. Elected by a large vote, he automatically became the chief executive in April 1841 when Harrison died. Immediately Tyler's strict states' rights views conflicted with the nationalistic ideas of Henry Clay, the nominal Whig leader in Congress. Since Tyler was the first vice-president to be automatically elevated to the presidency, Clay tried to curtail his powers by suggesting that as only an "acting president" he did not have the full constitutional rights of an elected chief executive. Tyler, however, insisted upon retaining the full powers of his office and was later responsible for defeating the enactment of Clay's American System. After Tyler had twice vetoed the bill rechartering a national bank, Clay declared him a party outlaw and persuaded all the Whigs except Daniel Webster to retire from his Cabinet. Webster remained until 1842 to negotiate the famous Webster-Ashburton treaty. Tyler was now a man without a party and without significant support in either house of Congress.



FABIAN BACHRACH

*JOHN TYLER, TENTH PRESIDENT OF THE UNITED STATES*

During the last two years of his administration his one great desire was to accomplish the annexation of Texas. His Secretary of State, A. P. Upshur, had all but completed a treaty with Texas when he was killed by an explosion on

the United States gunboat *Princeton*. Tyler then appointed John C. Calhoun as Secretary of State, but the latter's treaty was defeated in the Senate. Texas was finally annexed by a joint resolution passed by both houses of Congress after the election of 1844, but before Tyler had left office.

**Later Life.** Tyler had many supporters in both parties scattered throughout the country and in 1844 was actually nominated by a Democratic states' rights convention. He withdrew his name from consideration, however, when James K. Polk was nominated by the regular wing of the Democratic Party. Leaving office in March 1845, he retired to Virginia with his new wife, the former Julia Gardiner, whom he had married after his first wife, Letitia Christian Tyler, had died in 1842. From 1845 until 1860 Tyler practiced law, looked after his estate, and occasionally took an interest in local politics. When the dispute over slavery threatened war in 1860-1861, he led the movement that resulted in the calling of a border state convention to work out a compromise plan to save the Union. After acting as chairman of that fruitless meeting held in Washington, D. C., and when all hope of a compromise was gone, he supported secession in the Virginia convention. He was subsequently elected to the Confederate House of Representatives but died in Richmond, Va., on Jan. 18, 1862, before he could take his seat. G. E. M.

**TYLER,** a city in northeastern Texas, the county seat of Smith Co., about 100 mi. southeast of Dallas. The community, named in honor of President John C. Tyler, was first incorporated in 1846. In 1951 it had the city council-manager form of government. It is the seat of Butler and Texas colleges for Negroes, Tyler Junior College, and Tyler Commercial College. Transportation facilities are provided by the Missouri Pacific and the St. Louis Southwestern railroads and by the Delta and Mid-Continent air lines. Tyler is the shipping center for a fertile agricultural region in which tomatoes, cotton, sugar cane, grain, and nuts are grown. It is an important transfer point for the area's oil, gas, lignite, and iron ore. In addition, Tyler is reputed to be the rose-bush center of the United States, shipping millions of bushes throughout the country each year, and it is the site of the annual Texas Rose Festival. Its location as the largest city between Dallas to the east and Shreveport, La., to the west is primarily responsible for the city's development as the retail and wholesale trade market for the surrounding territory. The diversified local manufactures include clothing, water heaters, battery cases, optical instruments, foundry products, brick and tile, plastics, crates and baskets, and airplanes. Food canning, processing, and dehydrating are also carried on in Tyler. Pop. 1950, 38,968.

**TYLOR, SIR EDWARD BURNETT** (1832-1917), British anthropologist, was born in Camberwell on Oct. 2, 1832. He was educated at Grove House School, Tottenham, but received no university training. After a brief business career, he was obligated by ill health to travel, and in 1856 he went to Mexico with Henry Christy, pioneer archaeologist and prehistorian. This visit was largely responsible for turning Tylor to anthropology, and led to the publication of his first book, *Anahuac: or Mexico and the Mexicans* (1861). His second book, *Researches into the Early History of Mankind and the development of Civilization* (1865), laid the foundation of Tylor's professional fame, which reached its peak with the appearance of *Primitive Culture* (1871) and *Anthropology: an Introduction to the Study of Man and Civilization* (1881).

Unlike his contemporaries, most of whom were preoccupied with special problems, Tylor's ethnological interests were universal, and his anthropology concerned itself with the unity of human culture envisaged as a continuity. In spite of the meager data then available, his critical judgment was cautious and sound. Although he adhered to the unilinear scheme of cultural evolution then generally accepted, he was at the same time aware of the importance of diffusion as a dynamic of culture growth. His theory of animism as presented in *Primitive Culture* is one of the most impressive theories of primitive religion yet advanced. The first to apply statistical methods to ethnological data, he also contributed the useful concepts of survivals and adhesions.

From 1884 to 1909 Tylor was associated with Oxford University, first as reader in anthropology, and later as Oxford's first professor of anthropology. In recognition of his outstanding contributions to learning, he was knighted in 1912. Tylor died at Wellington on Jan. 2, 1917. H. T.

COURTESY OF THE NEW YORK PUBLIC LIBRARY

1515, and at Cambridge he became interested in reading the Greek New Testament, and, after tutoring for a year and being ordained, he resolved to translate the New Testament into English to remedy the ignorance of the clergy. Failing to enlist the help of the Bishop of London, Tyndale left England in 1525 and went to Wittenberg, where he met Luther. Driven from Cologne when his translation was partly printed, he fled to Worms, where he published his first edition, without his name, in 1525. It was widely distributed in England before the authorities discovered and burned it as dangerous.

As a hunted man, Tyndale moved frequently. He engaged in a pamphleteering controversy with Chancellor Sir Thomas More from which he emerged as the English champion of the Reformation. In 1534 he printed a revised edition of his New Testament, employing a dignified style which later formed the basis for the authorized version of the Bible in 1611. Betrayed by a false friend, he was thrust into prison at Vilvorde, near Brussels, where he translated at least the first five books of the Old Testament. Tyndale was tried at Vilvorde, condemned, and, on Oct. 6, 1536, burned at the stake. C. A. A.

**TYNDALL, JOHN** [tɪ′ndəl] (1820-1893), British natural philosopher, was born at Leighlinbridge, County Carlow, Ireland, on Aug. 2, 1820. Educated in the local schools, in 1840 he began work in the Irish ordnance survey office, being transferred to the English survey in 1842. From 1844 to 1847 he was a railway survey engineer, but in August 1847 he joined the teaching staff of Queenwood College, near Stockbridge, Hampshire, said to be the first school in England to adopt practical and laboratory work in the teaching of applied science. The following year he went to the University of Marburg, Germany, where two years later he received his doctorate. He returned to Queenwood in 1851, was elected a fellow in the Royal Society on June 3, 1852, and on July 6, 1853, became professor of natural philosophy at the Royal Institution. Tyndall had begun to establish his reputation as a scientist and as an investigator, though much of his fame is due to his personality and skill as a lecturer rather than to the originality of his research. His investigations into the characteristics and properties of radiant heat (1859-1871) probably constitute his major scientific contribution. He was also in demand as a scientific adviser. In March 1887 Tyndall resigned his chair at the Royal Institution because of his continued poor health and retired to his country home, Hindhead House, Surrey, where he died on Dec. 3, 1893.

Of his many books and scientific papers, *Heat Considered as a Mode of Motion* (1863) was probably his most authoritative publication. Other important books were *On Sound* (1867) and *Contributions to Molecular Physics in the Domain of Radiant Heat* (1872). T. R. H.

**TYNDAREUS** [tɪndɛ′əriəs], in Greek legend, the son of Perieres and Gorphone, or of Oebalus of Sparta and the nymph Batia. He and his brother Icarius were driven from Sparta by another brother, Hippocoön. Tyndareus fled to Aetolia, where he married Leda, the daughter of Thestius, but he was later restored to Sparta by Heracles, who slew Hippocoön and his sons. By Leda, Tyndareus became the father of Clytemnestra and Castor, while Helen and Pollux were the children of Zeus and Leda; according to another tradition, Zeus was also the father of Castor. The patronymic Tyndaridae, or "sons of Tyndareus," was sometimes given to Castor and Pollux. *See also* LEDA. G. E. D.

**TYNE** [tai′n], a river formed by the union of the North Tyne and South Tyne in Northumberland, England. The former rises in the Cheviot Hills, the latter just below Cross Fell; united in the Tyne, they flow into the North Sea. The Tyne has been dredged to take larger and larger ocean-going vessels; its high spring tides reach a height of 29 ft. as far up as the bridge town of Newcastle. The Tyne is the chief harbor area of the northeast coast, and from Newcastle to Gateshead its banks are lined with shipyards, glass and chemical works, and lead-smelting and iron furnaces. Its length is about 80 mi. and it drains an area of 130 sq. mi. S. Van V.

**TYNEMOUTH** [tai′nməth; tɪ′nməth], a municipal, county, and parliamentary borough and coast guard station in Northumberland, England, situated at the mouth of the Tyne River, about 270 mi. northwest of London. Tynemouth was a Roman settlement, but its history actually begins with a seventh-century monastery which was raided at least three times and totally destroyed. Another monastery was erected in the eleventh century, of which remains stand. Charters were granted to the prior in 1203 and 1204, but Tynemouth did not become important until the nineteenth century, for up until that time the citizens of Newcastle, 8 mi. to the east, would not permit the establishment of a port. The town, incorporated in 1849, was made a county borough in 1904. During World War II Tynemouth, with other towns on the Tyne River, was bombed, particularly from July 1940 through December 1941. The community is a popular resort. Its principal industry is fishing. Pop. 1952, 66,900. A. W.

**TYPE.** *See* PRINTING AND GRAPHIC ARTS.

**TYPEWRITER.** *See* BUSINESS MACHINES AND EQUIPMENT.

**TYPHOID FEVER,** enteric fever, an acute, specific human infectious disease, caused by a bacterium, *Eberthella typhosa.*

**History.** Thomas Willis, in 1643, first described typhoid fever. It was often confused with typhus fever until Gerhardt in 1837 distinguished the two, and coined the name, which means typhuslike. Budd in 1856 epidemiologically proved its infectiousness via the patient's feces. Eberth in 1880 demonstrated the typhoid bacillus. Severe typhoid mortality in the Spanish-American and Boer wars led to the development of the protective typhoid vaccine (Kolle, Pfeiffer, Wright, Russell). The sharp reduction of typhoid fever incidence in all countries employing sanitary procedures since the turn of the century is one of the outstandingly successful contributions of public health methods.

**Epidemiology.** The most important modern source of the typhoid bacillus, which is of world-wide distribution, is the typhoid carrier. These carriers at times unwittingly contaminate water, milk, or food, and initiate typhoid epidemics. Raw shellfish, fresh fruits and vegetables, and flies may be vehicles of infection. The large-scale, summer, water-borne typhoid outbreak, so common 40 years ago, emanating from a single case, is becoming a rarity in areas where sanitary measures are enforced.

**Pathology.** The typhoid bacillus enters the body by being swallowed. It lodges in the Peyer's patches of the lower small intestine, where it multiplies, and invades the blood stream, when fever begins, about ten days after infection. Lymphoid tissue all over the body, including the spleen, exhibits a characteristic inflammatory change.

**Clinical Course and Diagnosis.** Typhoid begins insidiously with malaise, headache, body pains, and loss of appetite during the first week, while the fever builds up gradually to 104°. It stays at this level, or plateau, for a week or two, with a daily fluctuation of a degree or so, then over another two weeks recedes to normal. In most cases there appears after the first week an abdominal rash, the rose spots. The pulse is slow, relative to the fever, and the white blood count is low. The abdomen becomes bloated with gas very early and remains so; constipation is the rule, alternating with the passage of the typhoidal "pea soup stool." Nosebleed and bronchitis are frequent symptoms. At the height of the fever the patient appears extremely ill; he is stuporous and mildly delirious by turns. Absolute diagnostic proof is furnished by finding the typhoid bacillus in the blood the first week, and in the feces and urine the second. The Widal test, clumping of typhoid bacilli by the patient's blood serum, becomes positive in the second week but is not so reliable diagnostically as a positive culture. Complications of typhoid are intestinal hemorrhage and perforation, pneumonia, thrombosis, and laryngitis. Relapses are frequent but, as a rule, mild.

**Treatment.** With good treatment and nursing, mortality is about 10 per cent. Various antiserums and a specific

bacteriophage show promise. Streptomycin has proved of little value. The old fluid diet has been replaced by full feeding. Sponge baths or cold packs help reduce temperature. Intestinal perforation calls for immediate surgical closure. F. P. Ma.

**TYPHOON.** *See* METEOROLOGY.

**TYPHUS FEVER,** an acute, severe, louse- and flea-borne infectious disease, caused by *Rickettsia prowazeki.* There are two very distinct types: the epidemic and the endemic.

**Epidemic Form.** Epidemic typhus fever, also called classical typhus, ship fever, jail fever, or *tabardillo,* is primarily a disease of the Old World. It first appears definitely in history in Germany in the sixteenth century. Since then typhus has repeatedly been a decisive factor in military history; its ravages often exceeded battle casualties, as in the Thirty Years' War, Napoleon's Russian invasion, the Crimean War, and World War I. Three million typhus deaths occurred in the Soviet Union between 1917 and 1921.

Since this type of typhus is commonest in winter and since lice flourish in thick winter clothing, and in wartime crowding and dirt, suspicion early turned to the louse as a vector; in 1909 Charles Nicolle proved the transmission of typhus fever from man to man by the body louse, *Pediculus humanus corporis.* The head louse is also a vector of typhus, but not the crab louse. There is no animal reservoir of epidemic typhus. Between epidemics the disease lies dormant in human cases which have become chronic, or carriers. Such cases, described as Brill's disease, are occasionally seen in the eastern United States. In epidemics, the louse catches the disease from biting an infected human. A few days later, its intestinal tract is filled with the typhus *Rickettsia,* and the louse becomes infective and dies after about 12 days. The direct bite of the louse does not introduce the disease; it is caused by the scratching into the bite of the louse feces deposited near by. The typhus-producing *Rickettsia* is smaller than most bacteria, and needs living tissue for its growth. It invades and destroys the lining of the smaller blood vessels. The incubation period in man is 10 to 14 days. The onset is abrupt, with chills, fever, headache, backache, and a few days later a spotty rash, first seen on the abdomen. Fever rises fairly smoothly to about 104° but drops rapidly after 2 weeks. More than half the patients may die in a severe epidemic. The disease may be diagnosed positively the second week by the complement fixation and Felix-Weil blood tests. Prevention lies in immunization by vaccine and in louse control. World War II gave large-scale proof of the efficiency of Cox's vaccine, grown in chick embryos. The widespread use of DDT powder is apparently more efficient than the older, steam delousing methods.

Para-amino-benzoic acid is the only drug showing much promise in treatment. Good nursing is very important.

**Endemic Form.** Endemic typhus fever, murine, American, or flea typhus, accounts for about 5,000 cases in the United States annually. This type occurs in the warmer parts of both hemispheres. It is largely a rural and a summer disease, and is much milder than epidemic typhus. It is primarily a disease of rats, which is transmitted to man by the rat flea; rat control is therefore of utmost importance in its prevention. F. P. Ma.

**TYRANNICIDES.** *See* HARMODIUS AND ARISTOGITON.

**TYRE** [tai'r] (Arab. Es Sur), important commercial city of antiquity, south of Beirut on the coast of Lebanon at the east end of the Mediterranean Sea. At the time of his visit to Tyre, about 450 B.C., Herodotus was told by the priests of Melkarth that their city had been founded 2,300 years before, or about 2750 B.C. The earliest reference to Tyre in contemporary historical sources is in the Tell el-Amarna tablets of the fourteenth century B.C. These include ten letters addressed to the Pharaoh by Abi-Milki, governor of Tyre, indicating that the city was then subject to Egypt. Part of the city was on the mainland, while the seaport was on two rocky islands off the coast. The island location gave the city its Semitic name Es Sur, "the rock," and this name became Tyre in Greek. Since it was the most important of the Phoenician cities, the Greeks also gave its name to the whole region, which they called Syria.

The best-known king of Tyre was Hiram, the contemporary of the Hebrew kings David and Solomon. As narrated in the Bible, Hiram provided craftsmen and materials for the building of David's palace and of Solomon's temple and palace, and also sent "shipmen that had knowledge of the sea" to sail in Solomon's navy. At Tyre, Hiram connected the smaller, more westerly island, on which the famous temple of Melkarth had long stood, with the larger island by means of an embankment; he also enriched the temple of Melkarth with donations of gold and with the dedication of a pillar of gold. The seventh king after Hiram was Ethbaal, whose daughter Jezebel married King Ahab and promoted the worship of Baal in Israel.

In the Assyrian, Neo-Babylonian, and Persian periods Tyre was for the most part subject to these great powers of the East. Assyrian kings from Ashurnasirpal II to Ashurbanipal record the subjecting of Tyre and the taking of tribute from its inhabitants. Nebuchadnezzar II of Babylon kept the city under siege for thirteen years while Ethbaal II was king, and the Persians included Tyre in the fifth satrapy of their far-flung empire.

Alexander the Great took the city in 332 B.C., but only after a terrific seven months' struggle in which he built a mole from the mainland to the island, and attacked by ship from the sea as well. Alexander's embankment was widened by natural deposits of sand, and now provides an arm of land more than a quarter of a mile wide reaching from the mainland to the former islands. Later Tyre passed under Egyptian control; then in 198 B.C. it was taken by the Seleucids, from whom it gained self-government in 126 B.C. Rome took the city in 68 B.C., and under Roman rule it became capital of the province of Phoenicia and its richest commercial city, known for the manufacture of purple dyes from the shell of the murex.

Jesus Christ visited the "borders" of Tyre (Mark 7:24), and Christianity was established there at the time of Paul's visit recorded in Acts 21:3-6. A splendid cathedral was dedicated at Tyre about A.D. 316 by Eusebius of Caesarea, and important church councils were held there in 335, 449, and 514 or 515. The city was held by Arabs from 638 until its capture by the Crusaders in 1124. The chief city of the Latin kingdom of Jerusalem, Tyre was recaptured by Moslems in 1291 and destroyed. With the exception of a brief appearance of the French in 1799, between Napoleon's two Egyptian campaigns, Tyre was under Turkish rule from 1516 until 1918, when the area was taken by British troops under General Allenby. In 1920, it was included in the French Mandate of Syria, which was relinquished during World War II, and in 1941 it was made part of the Republic of Lebanon.

The climate is Mediterranean, with short, cool, wet winters and long, hot, dry summers. The average annual temperature is about 70° F., with a winter average of 56° F. There is, on the average, a rainfall of 30 in. between November and February. Agriculture is the most important occupation, and cereals, vegetables, citrus fruits, and olives are grown. Pop. (off. est. 1948), 9,455. J. F.

**TYROL.** *See* TIROL.

**TYRONE, 2ND EARL OF.** *See* O'NEILL, HUGH.

**TYRONE** [tɪro′n], an inland parliamentary county of Northern Ireland, bounded on the north by County Londonderry, on the east by Lough Neagh, on the southeast by County Armagh, on the south by Monaghan, on the southwest by Fermanagh, and on the west by Donegal. Its extreme length is 55 mi., west to east, and extreme breadth, 37½ mi., south to northeast. With an area of 1,261 sq. mi., it is the largest county of Northern Ireland. In general, the surface is hilly and irregular, rising in the north central part to the Sperrin Mountains, a high, bare, east-west ridge of mica-schist, whose greatest elevation, Sawel Mountain (2,240 ft.), is in County Londonderry. The annual temperature averages from 44° F. to 50° F., the temperature for January being 41° F. and that for July, 60° F. The January rainfall ranges from 3 to 6 in., July rainfall from 3 to 4 in., and the mean annual rainfall from 30 to 60 in.

The principal occupation is agriculture, there being more tilled land in Tyrone than in most Irish counties. On the other hand, Tyrone has less acreage under pasturage than the neighboring counties. A wide area is devoted to oats, potatoes, and flax. Principal manufactures are linens, woolens, and coarse earthenware. Lignite is found along the shore of Lough Neagh. The richest coal deposits in the county are in the small coal field near Coal Island. Marble and red sandstone are quarried in the south near the Monaghan border. Omagh, on the Strule in west central County Tyrone, is the county town. Other large towns are Strabane, Dungannon, and Cookstown.

The county name is a shortened form of the Gaelic *Tir Eoghan,* the territory of Owen-Owen the son of Niall of the Nine Hostages. The whole present county, with Londonderry and part of Donegal, constituted the principality of the O'Neills. There are early Irish stone crosses at Arboe, Coagh, Cookstown, Donaghmore, and Dungannon, and an early Irish church and cross at Errigal Keeroge near Ballygawley. Tyrone attained its maximum population, 312,956, in 1841. Since that year there has been a steady decline in population. Tyrone returns five members to the Parliament of Northern Ireland. With Fermanagh, Tyrone returns two members to the Parliament of the United Kingdom. Pop. 1953, 133,000. S. Van. V.

**TYRONE** [tai′ron], a borough in Blair Co., in central Pennsylvania, situated at the confluence of the Little Juniata River and Bald Eagle Creek, in the foothills of the Allegheny Mountains, 14 mi. northeast of Altoona. Settled in 1850 and incorporated in 1857, Tyrone is governed by a mayor and council. The Pennsylvania Railroad provides transportation facilities for the community's industries, whose products include paper, chemicals, shirts, boilers, mine machinery, and lime and clay products. There are limestone quarries in the vicinity, and agricultural products of the area include apples, grain, and potatoes. Pop. 1950, 8,214.

**TYROSINE.** *See* PROTEINS.

**TYRRHENIAN SEA** [tɪri′niən], that part of the Mediterranean Sea which washes most of the western coast of Italy. It is bordered by the Ligurian Sea on the north, the islands of Corsica and Sardinia on the west, the open Mediterranean and the island of Sicily on the south, and the Italian mainland on the east. It is extremely deep, reaching over 12,000 ft. in some places, and its waters are strikingly clear. The most important islands touched by the sea, other than Sicily, Sardinia, and Corsica, are Elba, Giglio, Montecristo, Ponza, Ischia, Capri, Lipari, and Stromboli. R. W. Cr.

**TYRTAEUS** [tɜrti′əs] (seventh century B.C.), Greek elegiac poet, wrote to encourage the despondent Spartans during the Second Messenian War, perhaps in 635 B.C. Tradition asserts that he was a lame schoolmaster whom Athens, in mockery, sent to help Sparta. Though perhaps of Ionian origin like other early Spartan poets, he sometimes speaks in tones of such authority as to suggest noble Spartan birth. His elegies are martial and political: in some he exhorts the Spartans to vigorous action, contrasting the disgrace of the coward and fugitive with the lasting renown of the patriotic warrior. Other fragments, commending *Eunomia* (orderly government), depict the Spartan constitution, ascribing it to the express ordinance of Apollo. In both respects he clearly reveals the Spartan concept of civic virtue. Like other early elegists, Tyrtaeus uses an epic Ionic vocabulary, though he is closer to Hesiod and the Homeric Hymns than to the Homeric poems; nevertheless, occasional Doric elements are to be found. C. M. D.

**TYUMEN** [tyumye′ny], the name of a region and its chief city in the Russian Soviet Federated Socialist Republic, in the central Soviet Union.

**The City.** Tyumen is a commercial center, about 185 mi. east of Sverdlovsk, at 57° 15′ N. lat., 65° 18′ E. long. It lies on both banks of the Tura River in the great Siberian lowland. An old Tatar settlement, the origin of which is unknown but which appeared on a map of 1546, it was an important center for the movement of exiles and immigrants eastward into Siberia. Though not on the Trans-Siberian Railway, it lies on the important Sverdlovsk-Omsk line. Its waterway traffic is especially important since it receives goods by river boat from Tobolsk, Omsk, Semipalatinsk, and Novosibirsk for shipment to the Urals area. It has large tanneries and small iron works. Manufactured products include silk, wool, river boats, flour, lumber, rope, and machines. Pop. (est. 1950), 110,000. C. C. H.

**The Region.** Tyumenskaya Oblast is an administrative unit of the R.S.F.S.R., located in western Siberia and created in 1945 from part of the old Omsk Region. It is bounded by the Kara Sea on the north, Krasnoyarsk Krai on the east, Tomsk and Omsk oblasts on the southeast, North Kazakhstan on the south, Kurgan and Sverdlovsk oblasts on the southwest, and Komi A.S.S.R. and Nenets National Okrug on the west. It includes Khanty-Mansiyisk and Yamal-Nenets national okrugs. With tundra and the vast water system of the Ob River in the north, most of the region is taiga, or coniferous forest, with a small forest-steppe area in the south. Khanty-Mansiyisk and Yamal-Nenets are sparsely populated, and hunting and fishing are most important in their local economy. In the rest of the region, cereals, livestock, dairy and agricultural products, and timber are produced. The region lacks mineral resources. Pop. (est. 1954), 950,000. W. S. V.

**TZ'Ŭ HSI** [tsʊ′ shi′] (1835-1908), Chinese empress dowager. She entered the palace as concubine of the Emperor

Hsien Fêng in 1852. Presenting the Emperor with his only son, she was elevated to the rank of concubine of the first class, ranking just under the Empress. Upon the death of Hsien Fêng in 1860, Tz'ŭ Hsi, as empress mother, entered upon her first period of power as co-regent. Upon the death of her son, the Emperor T'ung Chih, in 1875, she was instrumental in putting another minor on the throne so as to resume direct rule as regent. Her dominance continued even after this emperor, Kuang Hsü, officially assumed sole power in 1889, in spite of his attempt to assert himself as a reform leader. Failure of the reform movement led to Kuang Hsü's imprisonment from 1898 until his death in 1908. Tz'ŭ Hsi then put another minor, Hsüan T'ung, on the throne so that her regency might continue. Her death in 1908 lessened the ability of the dynasty to survive the revolution in 1911.

The period of Tz'ŭ Hsi's rule was one of increasing strain from foreign pressures and also from internal disintegration. The personal element in Chinese government, which increased under her rule, had a weakening effect on the entire administrative system. It resulted in greater favoritism in the making of appointments, an extensive traffic in office, and irresponsibility due to the influencing of decisions by those who enjoyed her personal favor. Consequently Tz'ŭ Hsi cannot be absolved from a personal responsibility for the condition of China at the time of her death. H. M. V.
